CHICAGO EXHIBITION

HIGHEST AWARDS.

ALBION CLAY COMPANY

LIMITED.

SOLE MANUFACTURERS of the  "GRANITIC STONEWARE" Pipes.

TRADE MARK.

All the "**Granitic Stoneware**" Pipes are made from "**Stoneware**" Clays, of which we are the Sole Proprietors. The Clays are carefully selected and blended to insure a hard, dense, **impervious and imperishable** body, specially adapted for **Sanitary** purposes. The Pipes have a "**toughness**" as opposed to "**brittleness**," which is not possessed by any other Stoneware Pipes. They have been proved to withstand the highest crushing and bursting pressures under tests by Kirkaldy and other authorities at home and abroad. They are made by the most improved Patent Machinery and are highly approved for their uniform superior quality. All the Pipes are stamped with the Trade Mark, "**Granitic Stoneware**," as above.

TESTED PIPES.—Selected and Tested under Hydraulic Pressure and Marked

All sizes to 24in. diameter of full Standard thickness, and of any length up to 3ft. for 6in. and upwards.

PATENT PARAGON PIPES.

PATENT PARAGON PIPE. C FORM

PERSPECTIVE VIEW

LONGITUDINAL SECTION THROUGH C.D.

SECTION THROUGH

Sound Portland Cement Joints to stand any test. True alignment of the Invert and Firm Rest. No obstructive ledges at Invert as with ordinary Socket Pipes. Free Flow. No Stoppage. Full Capacity of Sewers and Drains maintained.

CHEAPEST IN FIRST COST AND MAINTENANCE.

The **Patent Paragon Pipes** are superseding the **Ordinary Socket Pipes**. They are being specified for important Sewerage and Drainage Work in all parts for Government, Corporations and Sanitary Authorities. They have been used for the new Drainage of Smedley's Hydropathic Establishment, Matlock, Derbyshire, and the Royal Opera House, Covent Garden, London, &c.

To meet the requirements of **Sewerage and Drainage** according to circumstances, the **Patent Paragon Pipes** are made in **three** forms:—(A) With ordinary depth of Socket for Surface Water Drains, &c.; (B) With **deep** Sockets for **Sewers** and **House Drainage** and (C) With **extra deep** Sockets for the Best Class of Work.

When **specifying**, the Name should always be given in full, as **Patent Paragon Pipes A, B, C**, according to the kind required.

SYKES' PATENT JOINT PIPES.

THE MOST RELIABLE
PIPES FOR MAIN SEWERS
IN WATER-LOGGED
GROUND.

WATERTIGHT JOINTS
MADE WITH THESE
PIPES WHEN ENTIRELY
SUBMERGED.

The Screw Joint ensures true alignment of the Pipes. The **Patent Jointing Material** is **impervious** and **imperishable**. It sets slowly and yields for a time to any settlement of the Pipes in bad ground. It cannot enter the pipes and cause obstruction therein, as in grouting. Sykes' Patent Joint Pipes have made Watertight Joints in water-logged ground where other Patent Joints have failed. Easily laid by ordinary Pipe-layers. Bends and Junctions easily inserted.

Moderate in Cost, Easy to Lay, and the most Reliable of any for Bad Water-logged Ground.

SYKES' PATENT SEWER GAS INTERCEPTOR. The most **EFFECTIVE** for the **PRESERVATION** of **HEALTH**.

JONES & SYKES' PATENT CHANNEL BENDS FOR **MANHOLES** AND **INSPECTION CHAMBERS**.

SANKEY'S PATENT DEEP INTERCEPTING GULLY, with Galvanised Bucket to hold Detritus. Cannot untrap.

KEITH'S PATENT DRAIN TESTING AND FLUSHING TRAP. Simple in Construction, efficient and reliable.

SYPHONS, GULLIES, INTERCEPTORS, &c., with **PATENT PARAGON SOCKETS**, to avoid check to flush in forcing Solids through the Trap and fitted with **SYKES' Patent Screw Stoppers**.

INVERT, JUNCTION, and GULLY BLOCKS, STREET GULLIES to any size. **LATRINES, CLOSETS, SINKS, &c.**

Works: **WOODVILLE, BURTON-ON-TRENT.**

CHIEF LONDON OFFICE: **18, NEW BRIDGE STREET, E.C.**

LONDON DEPOT: **MIDLAND RAILWAY (Somers Town Goods Station), OSSULTON STREET, EUSTON ROAD, N.W.**

An Architectural Causerie.

An Object Lesson.

ONE had occasion three weeks ago to refer in this column to the braggart instincts which so much deform the Art impulses of the present day. The article dealt with this question in a facetious and irresponsible manner, which assumed a general recognition of those egotistic self-advertising qualities of typical modern Art ideals which it was one's worthy object to exploit and deride. It seems, however, that a certain reader of this journal, and possibly yet others beside him, misunderstood the subject of one's capers, and, not having noticed the derogatory qualities in question, failed to comprehend one's language. It is, however, widely realised that egotism is one of the most enervating influences that can beset an Art, and the frequency with which the term is met with among modern writers and critics is itself evidence of the reality of the disorder which one has attributed to the architect and craftsman. But artistic egoism is not to be confused with personal vanity and self-esteem; the two are widely distinct, although in some individual cases they do no doubt impinge and melt one into another. An artist must naturally be conscious of his powers; must delight in them; must in his best hours be lifted up in a sort of elation to know that he has been permitted to interpret for the understanding of the world his most sacred convictions and passionate loves and enthusiasm; but while one man will feel this purely, and with a sort of reverence which sets him superior to all worldly issues, another, no less a true artist in his motives and his results, will take a human pride in his power and his gifts, and pose and strut in a fashion that indicates a weak and shallow nature, riding side by side with a great abnormal ability. But neither of these two men need of necessity be tyrannised over by the so-called "Artistic Egoism." There are numberless instances to the contrary. Wagner's is a notorious case of the vain man in whom lay the strength, devotion, and burning conviction of an artist and a genius. Our own Oliver Goldsmith was another notorious instance of the same coupling of these same antagonistic qualities, but neither of these men was an egoist in his Art. For the vital test lies here: it is in the motive, the impulse of the artist's work. The man who works with the consciousness of himself uppermost, who would celebrate himself rather than the ideal he is creating, in whom personal vanity and ambition are not completely subordinated to a devoted attachment to the work for its own sake, and for the sake of that other subtle, glowing impulse which is not to be defined—he is the egoist. It will be seen, therefore, that this impure motive must reveal itself in the completed work. We have only to consider objects of archaic artistry and we must realise that it is not the artistic connection, nor finish, nor technical precision which affects the beholder, but the truth and enthusiasm of the impulse that touches us and awakes our sympathies. Can any understanding person listen to "Lohengrin" and "Tristan and Isolde," for instance, or read "The Deserted Village" and "Vicar of Wakefield," and not recognise the burning, life-absorbing devotion and enthusiasm which thus analysed the

appeals of the blue sky and wide landscape, and the despair and passion of hopeless love; or doubt the blemishless sincerity and truth of the human sympathy which underlies the polished diction of Goldsmith's pages? Now the Art of the poet and the musician—and in these days, unfortunately, that also of the painter, and even the sculptor—is in the main personal; each practitioner is, so to speak, a virtuoso. Let him but be true to his own pure ideals, and he is true to his Art. But with the architect and craftsman it is far otherwise. They are hedged about with necessities; they can have no ideal but such as conforms with the life of the people as it is now ordered; and the man who ignores these legitimate limitations of his Art, and would be a law unto himself, working in the same irresponsible spirit as the musician and painter, comes perilously near to being an egoist in his work. He may indeed be merely foolish and unthinking, but the natural and just imputa-

chair, and its decorative qualities would be secondary to these, and would eulogise and emphasize them. A lack of this genuine impulse is widely to be met with among the work of the new generation of latter-day architects and craftsmen, and because this taint shows itself precisely in that field of thoughtful and original work to which we all look as providing the seed for a truer and more exalted architectural method than the nineteenth century will ever see, it is well and right to direct attention to it. B. C.

AMONGST other gatherings of the wise, the periodical Congress of the Sanitary Institute occupies an unique position. There are various meetings at which eminent men of science are wont to

ARTS AND CRAFTS EXHIBITION AT MANCHESTER: WOODEN INLAY BEDSTEAD.
DESIGNED BY EDGAR WOOD.

tion that must always attach to him will be the charge that (in the least) he places his own personal feelings and ambitions above and before his work, and when we view modern Architecture and craftsmanship, it is clear that a shallow-pated vanity and personal conceit is the vital impulse which directs and cherishes a great deal of it. The late Arts and Crafts Exhibition, among a great many true and valuable contributions, showed a quantity of this class of work, which must have provoked astonishment that such pitiful human weakness and vanity could be expressed through the medium of wooden furniture. The recipe for much of this work seemed to be to conceive a wriggle in the abstract, and then give it expression in a chair, screen, or table. A man who truly designed a table or a chair would be concerned in the first place to produce an excellent table or chair—one that should recommend itself for its genuine utility, for the perfection with which it fulfilled the essential needs of table or

foregather, and much profit may be derived by those who are privileged to hear the wisdom of their utterances. The practical effect in such cases, however, may perhaps be compared to that produced upon a congregation by a popular preacher, and is in all probability chiefly confined to those endowed with appreciative minds, and who are generally not included in the classes most in want of reformation or instruction. In this respect the work of the Sanitary Institute differs from that of some scientific associations, for it is eminently a practical body, whose members are working continuously, both individually and collectively, to attain one great object, the health and physical welfare of the nation at large. It is true that many other societies and institutions exist which are performing similar services to the State in connection with Architecture, engineering, medicine, and chemistry, but a part of their valuable work fails to achieve its full measure of success for lack of co-operation amongst the sister professions represented. It is difficult to suggest how

this may be avoided in the case of associations directly representative of distinct branches of science, but a happy illustration of joint effort is afforded by the Sanitary Institute. Amongst its members are to be found men known to the world as eminent architects, engineers, physicians, and chemists, as well as many who have taken an active part in imperial and local legislation. Not only at congresses, such as that recently terminated at Birmingham, but at the numerous sessional meetings of the Institute, there are ample opportunities for the consideration of practical questions from every point of view. Those engaged in the design of building or of engineering works may discuss physiological, biological, and chemical essentials with the pathologist, the bacteriologist, and the analyst. On the other hand, the latter have opportunities of becoming better acquainted with recent structural and kindred practice, and with the latest types of mechanical appliances serving various purposes in the wide field of sanitary science. An institution including such diverse and yet co-relative elements, obviously possesses many exceptional advantages. The mere fact of meeting on common ground with one main object in view is also calculated to inspire mutual confidence and respect, and should tend to discourage a state of things still existing under which the functions of several professions become somewhat illogically mixed. It is scarcely desirable that the architect should be expected to advise as an expert upon subjects appertaining to the engineer or chemist, that the engineer should be asked to report upon bacteriological or analytical matters, or that the medical officer should sometimes have to pose as an authority on structural or engineering work. A strange though striking example of perverse conservatism is to be found in the fact that either ridicule or obliquy or both still rest to some extent upon so classical and appropriate a term as the word "sanitary." An average person, and notably the proverbial "man in the street," automatically associates with the adjective "drains" in some form or other. True sanitary engineers, who as a body are responsible for some of the most important public works in the country, consequently hesitate to adopt their appropriate designation, which therefore is almost exclusively monopolised by bricklayers and plumbers. These, although performing invaluable work, are scarcely to be regarded as sufficiently representing a class upon whom the welfare of the whole community so largely depends, and it may be hoped that some day the term "sanitary engineer" may occupy the high position which it merits. The Sanitary Institute is engaged in a great national work, which should have the sympathy of all, and whose importance cannot be over-estimated. As stated in its constitution, the objects of the Institute are "to promote the advancement of sanitary science in all or any of its branches, and to diffuse knowledge relating thereto." These aims are being forwarded by the reading and discussion of papers, by lectures and practical demonstrations to students and others, by the circulation of literary matter published in this country and abroad, and by the holding of Sanitary Congresses and Exhibitions open to the public at large. Further, special courses of lectures are provided, and examinations are conducted for the benefit of those who require such special training as qualifications for official positions. Sir Joseph Fayrer, in his opening address to the Birmingham Congress, pointed out that "Fifty years ago the great mass of the population lived and died under conditions which violated all the now well-known principles on which health depends; prejudice, ignorance, and vested interest stood in the way of progress." In those days the ruling powers were unconcerned, and the people were both indifferent and opposed to alterations. Even in the

present day it may be added that ratepayers often oppose necessary schemes of water supply and of other improvements, objecting not only to possible increase of local taxation, but to the disestablishment of things which were "good enough for their fathers." If such good folk were brought to realise that the indirect cost of preventable disease is vastly in excess of direct preventive outlay, their financial policy might be discovered to be not inconsistent with filial reverence. Much has been done in the education of the masses, and in speaking of the work of the Sanitary Institute, Sir Douglas Galton remarked upon the improvement in the vital statistics of the population as evidenced by reduced death rates, by increased prospective longevity, by decline in some most powerful causes of death, and by the total disappearance of others. These improvements are without doubt largely owing to the work of the Institute and of kindred organisations, aided by an improved and enlightened system of local government. To refer specifically to the programme of the Birmingham Congress would in itself much exceed the limits of available space. Of course there was a certain amount of play, or perhaps it would be more proper to say of healthful recreation, during the session. The bulk of the time was, however, fully occupied in serious work. In addition to addresses by such well-known sanitarians as Sir Joseph Fayrer, Sir Douglas Galton, Dr Sims Woodhead, and others, upwards of 70 papers were read and discussed in the various sections. Conferences of municipal representatives, medical officers of health, municipal and county engineers, and sanitary inspectors were held, in which subjects were brought forward dealing with the dwellings and surroundings of the poor, municipal abattoirs, sanitation in rural districts, the Church and sanitary science, hospital reform, the inspection of canal boats, and the advantages of motor vehicles. A conference of ladies interested in domestic hygiene also took place, where the subject matter included the influence of women in household sanitation, sanitary knowledge for nurses, village nursing, and, of course, the hygiene of dress. Sectional meetings were also arranged for the consideration of preventive medicine, Architecture and engineering, physics, chemistry, and biology. At these were discussed questions such as food preservation, typhoid fever, birth-rate, water supply, drainage, the pollution of streams, water analysis, bacteriological phenomena, and the purification of sewage period. The Health Exhibition, held in Bingley Hall, forms no unimportant a part in the work of the Congress. Conducted on lines sufficiently popular to attract the general public, it contains an assortment of objects, of value not only to those to whom they are professionally interesting, but likely to attract the attention of the casual visitor. As evidencing the widespread recognition gained by the Sanitary Institute, it may be mentioned that upwards of 800 delegates from municipal bodies were present, and that a total of nearly 2000 tickets were issued for the Congress. The Corporation of Birmingham, one of the first municipalities to recognise the importance of sanitation, extended a most cordial welcome to members of the Institute, to whom we heartily wish Godspeed in their praiseworthy mission. W. N. T.

NEWCASTLE CATHEDRAL has just been reopened after extensive cleaning, decoration and the installation of the electric light.

SIR PHILIP MAGNUS has reopened a new technical institute at Wellingborough. The building has been erected by the Urban District Council at a cost of £3000, exclusive of the site.

"SOME LATTER-DAY PROCLIVITIES."

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I am afraid I must again weary you under the title of "Some Latter-Day Proclivities," for I find the answer of this analyser of "insect" self-sufficiency is again most inadequately informed of his own leanings in that direction.

He admits, with a candour becoming to his unconsciousness, the groundlessness of his claim to omniscience. This, Mr. Editor, is a most timely admission of what has doubtless been painfully apparent to the readers of the article in question.

With all the irrelevancy of the young aspirant to literary fame, he informs us that with his "bladder-full of peas" he flogs the lowly donkey.

If the writer would only realise his limitations and confine himself to the floggings of that most patient animal, the readers of your journal would doubtless become more patient of his youthful excesses, if only exhibited in that direction. The supreme, almost superhuman, contempt with which he treats his readers when they venture into the realm adjacent to the illogical one he inhabits can only be equalled by the spirit of levity his ramblings invariably inspire in them. But, sir, I ask you, is it usual of a writer of any capability to remark of his readers that their reflections but keep him "merry"? An admission such as this is painful, for the realisation comes that the writer is aflame with the fire of his own egotism.

Just and sincere criticism—and, sir, I do not think I have exceeded this limit—comes to the best of us, as the promptings of an hitherto unknown friendship; correcting that which is false, and directing into one great current the innumerable streams of good which must be shown in all honest effort.

Yet "B.C."—the signature is somewhat old; I should prefer "A.D." as nearer our own times—is impatient at the smallest disagreement, intolerant of the most necessary disapproval, and barely courteous at the curbing of his soaring individuality.

I again repeat he should use of that self-examination he so hates. It would save him endless heartburnings, and silence much just criticism.

However feverishly he protest that "latter-day" is not synonymous with "modern," I beg leave to differ. It is not apparent in his article that he is discussing mediæval times or primitive man, as he would, perhaps, have us believe, for he mentions—I quote his own phrasing—"modern architect," and "the whole brood of latter-day artists." Are we to suppose that the term "modern architect" can be applied to the men, say, of the Jacobian period; or that "the whole brood of latter-day artists" flourished in the thirteenth century or thereabouts? I think not, sir!

I am afraid he is woefully adrift as to the "ear trained to specification clauses." It may be that an ear used to the eloquence of greater men more easily detects his little deficiencies. I will not echo, Mr. Editor, his phrase "of a silliness" with regard to his answer, however much my thoughts belie my smoothness of tongue; yet I may mention as a point of interest to himself, that not one word has he expended in defence of his contention that self-consciousness in Art is degenerate; and that, sir, was upon what I expended argument, seemingly sound to refute. This, in common I must admit with many others, I regard of immense importance.—I am, sir, yours faithfully, "F. B."

THE oldest Nonconformist place of worship in Richmond is the Bethlehem Independent Chapel, the 101st anniversary of which has recently been celebrated. It is a quaint little building in a quiet corner of the Ormand Road, perhaps one of the most old-fashioned thoroughfares in Richmond.

ROSE FRIEZE. MODELLED BY JAMES R. COOPER.

ARTS AND CRAFTS.

NOTES ON A NORTHERN EXHIBITION.

By A SPECIAL CORRESPONDENT.

THE small but interesting exhibition that is now open at the City Art Gallery, Manchester, is as unique in its way as was the first London exhibition of a similar character.

The proposal of the Northern Art Workers' Guild to hold an exhibition, which was to be exclusively confined to work of members of their own Association, was felt by many to be a daring experiment, and speculation was rife as to whether the material for such an exhibition would be forthcoming from this comparatively infant body of workers.

The experiment has been amply justified. Not only has the Guild been able to put together an intensely interesting collection of local work, but the whole of the multifarious accessories to such an exhibition, the poster design and printing, the literary and artistic work in connection with the catalogue and the printing and binding of it, the selection, arrangement, and hanging, and the public lectures which are being given in connection with the exhibition, have been the work of the members. In the case of one public lecture only has this rule been departed from.

Comparing the exhibition with previous Manchester Arts and Crafts exhibitions, a decidedly higher standard of merit in the works exhibited is noticeable, although the previous exhibitions were, of course, larger in

extent, representing as they did a much wider area of effort.

The most striking feature of the exhibition is undoubtedly the catalogue itself, a name which by no means conveys a correct impression of the dainty but vigorous booklet which contains on its closing pages a numbered list of the exhibits. The greater portion of this catalogue is occupied by a series of plain-spoken essays on the crafts represented, all of which are worth reading, and some of which provide plenty of food for thought. The Master of the Guild well says in his preface that the extent of the Guild's good influence will depend entirely on the faithfulness of its members to their ideals. If they are faithful to the ideals that they set up in these essays, that influence will be widespread and forceful.

The cover of the catalogue is a piece of good colour, a harmony in cream, orange, and green, in which we venture to question whether the drawing and design equals the colouring, and whether it coincides with the ideal of its author as expressed in his admirable essay.

Coming to the exhibits, the place of honour must be awarded to the somewhat large assortment of tiles and pottery scattered through the exhibition, all of which owe their production to the present Master of the Guild, Mr. William Burton, and his brother, Mr. Joseph Burton, both of whom are enthusiastic potters who believe in the adage, "What men have done men can do"—and a little bit more. These are not in the colourings that we usually associate with the com-

mercial "tile," nor are they so far removed from what is usually regarded as commercially saleable as to appear either singular, odd, or crude, as are too many of the productions of men striving to break away from the fetters of the commonplace.

Mr. Burton has been associated with Mr. Lewis F. Day and Mr. Chambers as designers, and with his brother, Mr. Joseph Burton, and others, in the production of these exhibits, but their chief charms of colour, glaze, surfaces, lustre, and texture, are due to his scientific mastery of the possibilities of the potter and the chemist.

We single out for special commendation the glazes which he terms onyx and sunstone, and the fine range of browns, pinks, and greens in his colourings. A point of much merit is the very artistic semi-gloss which characterises some of the best of the tiles. All artists in pottery will recognise the extreme difficulty of securing this precise degree of glaze free from any appearance of porosity and yet with no more gloss than an eggshell. Attempts to produce it in faience and tiles have usually resulted in "paintiness," but Mr. Burton has produced a glaze which really looks hard and sanitary without being "shiny."

The vases shown as experiments have passed the experimental stage, and possess much of the charm of colour of the best Oriental pottery. When procurable in quantities they should rapidly take the place of the garish treacly "pottery" in impossible yellows, greens, and magenta browns, that disfigure our "art pottery" shops.

TILE DESIGNS BY WILLIAM BURTON AND LEWIS F. DAY.

REPOUSSÉ METAL MOUNTED ON WOODS: "AIR," "EARTH," "SEA."

BY J. E. C. CARR.

Mr. Edgar Wood's untiring energy causes his name to figure largely in the catalogue. He shows some fine pieces of furniture, good metal work, and a number of drawings for Architecture and furniture. His work is conceived with simplicity, breadth and dignity, and we feel regret that this is sometimes spoiled by a certain weak addition of undignified ornament that is unequal to its task of adorning that to which it is applied. His sideboard is an altogether fine piece of work, as are the two chairs in oak and inlay that flank it, Nos. 5, 6, and 10. The inlaid ornament is perhaps obtrusive, but a very short ageing will mellow the whole into a satisfactory scheme of colour. His wooden bedstead, No. 134, is deserving of commendation. A chest of drawers, and a bedroom chair in sycamore, by Mr. Wood, are well designed, well made, but altogether spoiled by flimsy ornamentation. The exhibitor describes it as gesso, but it would be more correct to call it merely oil painting outlined with a cloison line slightly raised from the surface. The effect produced is much as if small oleographs had been pasted on to the level surface of the work. Ornamentation upon plain unstained wooden furniture should be in a treatment that is as durable as the furniture itself, and one feels that if this enrichment, admirably designed, placed and coloured as it is, had been in inlay, low relief, carving, lacquer, metal *repoussé*, or even gesso or painting if protected in slightly sunk panels below the general surface, these exhibits would have been extremely fine works. The metal enrichments, like the whole of Mr. Wood's metal work, are excellent.

Mr. J. E. C. Carr sends some very fine examples of brass *repoussé* work. His three panels, Air, Earth, and Sea, and his lockplates are good, while his "lamp for an inn" is really a powerful piece of sound rugged workmanship. Mr. Carr is particularly happy in the fine quality he imparts to the surfaces of his metal. He contributes a good chair, the best in the exhibition, and an extremely good wrought-iron fender.

Mr. Gustave Hiller's work in gesso, both figure and ornament, promise better things. He has used the gesso boldly in high relief, and with a considerable knowledge of modelling. His work is characterised by a "capacity for taking pains" and has a workmanlike deftness of finish that is admirable.

Mr. James Smithies shows a very fine plaque of beaten copper and several good examples of *repoussé* work, door furniture, a fender, and a fireplace. All these are good, workmanlike, commonsense articles, that would commend themselves to the general public, yet distinctly above the standard of commercial work. We regard his paten with ship in centre as the best piece of *repoussé* in the exhibition.

The modelled plaster friezes by Mr. Cooper are noteworthy, but his best pieces of design are the "corbels in plaster, for J. Gibbons Sankey, M.A., architect."

Our further notes and illustrations are held over for the next issue.

(To be continued.)

WARRINGTON COMPETITION.

THE NEW CONSTABULARY BUILDINGS.

BY A SPECIAL CORRESPONDENT.

THE result of the above competition was announced on Tuesday, September 27th, when the assessor, Mr. Bennett, President of the Manchester Society of Architects, appointed on the nomination of the President of the Royal Institute of British Architects, presented his report. The first premium of £100 was awarded to Mr. E. Burns Dick, of 55, Northumberland Street, Newcastle-on-Tyne; the second premium of £50 to Messrs. Tapper and Crouch, of 12, Gray's Inn Square, London, W.C.; and the third premium to Mr. S. Lane Fox, of Bond Street, Dewsbury, who receives £25.

GESEO PANEL. TEASEL THISTLE. BY H. GUSTAVE HILLER.

The number of designs submitted from various parts of the country numbered eighteen, and the buildings, to be erected on the site of the Old Barracks in Arpley Street, consist of new constabulary offices, lock-up, police and coroner's court, parade room 60ft. by 80ft., single men's quarters, sergeants and inspectors' houses, mortuary, &c. The site is

a particularly convenient one, having frontages to existing roads upon three sides; there is, however, a building called the Armoury on the site, 100ft. by 40ft., which is now used as a Technical School, and the instructions to competitors in respect of same were, "If there is sufficient space on the site for the requirements without interfering with the Armoury it would be desirable to retain the building, but in no case must the keeping up of this building be in any way detrimental to the freedom of design."

The conditions regulating the cost were very stringent, which was originally fixed at £15,000, but, in the answers to queries, it was stated that "any design not exceeding £16,000 would be considered." It was to include the apparatus for heating and ventilation, lighting, water supply, and all joinery and permanent fixtures and fittings. It, therefore, required a good deal of serious consideration on the part of competitors to keep within the limits specified. Having regard to the destination of the buildings, rigid economy, combined with an architectural treatment of severity and dignity, would therefore not only appear appropriate to the occasion, but also in keeping with the conditions issued.

In the first premiated design the cells are placed in the centre of site, between Wilson Patten Street and Arpley Street, and are entered directly from the charge-room, which is lighted from the airing courts on either side. The constabulary offices are arranged along Wilson Patten Street, with the magistrates' entrance and staircase near the west end of this block. The remainder of the constabulary offices are placed along the Arpley Street front, with a corridor between them and the charge-room. There is, therefore, no inspection of the latter from either the detectives' or inspectors' offices. The position of the parade-room 98ft. by 50ft. is midway between Museum Street and the cells, with the single constables' quarters ranged round the Arpley Street and Museum Street frontages. The inspectors' and sergeants' houses are placed on the site of the existing Armoury in semi-detached houses. On the first floor the magistrates' court is placed over the cells, with stairs from corridor to dock.

The coroner's court is on the Wilson Patten Street front, the public entrance to courts is by a staircase entrance from Arpley Street, which is placed between the male and female witness rooms for each court; the public corridor separates the former from the latter. The solicitors' rooms are placed on a continuation of this corridor towards Museum Street. The jury retiring room occupies the Wilson Patten and Arpley Street angle; it abuts on the coroner's court at the public gallery end, while the coroner's room occupies a similar disposition at the other end; then, working along Wilson Patten Street towards the west, comes the magistrates' clerk and magistrates' room, all entered from a continuation of the public corridor. The single

constables' quarters are placed round the Arpley and Museum Street angle, with separate staircase from parade-room.

The elevations are treated in a much turreted, gabled and hip-roofed manner, which suggests the public institute a great deal more than the police court or lock-up; while carving is frittered indiscriminately to accentuate the hap-hazard grouping of the whole. It would appear, having regard to the destination of the building and the conditions issued, much fuss might be spared.

The author cubes up the building at 662,000 cubic feet and prices the front portions at 6½d. per foot and the rear portions with Museum Street front at 5d. per foot, which gives a total cost of £16,500,* and he thus concludes his report:—"Being engaged on similar buildings for three city and borough corporations, I am familiar both with the class of details and fittings required and the cost of same, and have little hesitation in saying, with care and careful supervision, this estimate need not be exceeded."

In executing the design, the author will doubtless be able to make many improvements in the disposition of the building, which generally requires pulling together. The inspectors' and sergeants' houses are not well placed, the necessity of conveying food to the prisoners in their cells appears to have been completely overlooked, the supervision of the charge-room from the detectives' or inspectors' rooms leaves something to be desired, the cell corridor is well placed in relation to the charge-room. On the first floor the disposition of the solicitors' rooms and the mixing up of the witnesses with the general public in a common corridor, and the omission of any public waiting place will be unfortunate in practice; neither is the jury retiring-room well placed in relation to the public. There appears no private means of access for prisoners to the dock in the coroner's court.

The general disposition of the second premiated design is in many respects like the first. The cell corridor is not so well arranged for supervision from the charge-room, but the sergeants' and inspectors' houses appear much better placed; the parade-room is similarly placed, with the single constables' quarters ranged round two sides of same. The elevations are quieter in character and more in conformity with the destination of the building.

The third premiated design has caused much adverse comment. The buildings are arranged along Wilson Patten Street, there is no supervision of cell corridor from charge-room, the parade-room is semi-detached at one angle of the site, and the single constables' quarters are diagonally opposite. The author saves the Armoury building, but other competitors save it with an infinitely better scheme; and he places the dock on one of the side walls of magistrates' court. The author further makes a van entrance in the centre of Arpley Street, and thus detaches in a separate block the sergeant's house and single constables' quarters, and places a detached inspector's house at the north-west angle of site, with Armoury in between.

Messrs. Fryer and Warburton, of Warrington, send in a scheme saving the Armoury building; while Design F, by Mr. Harry May, shows a treatment of some skill, but elaborately carved, belonging to the Renaissance period. The plan gives no supervision of cell corridor from charge-room.

Design I exhibits a somewhat too eccentric plan and elevation, while J suffers considerable disadvantage from the necessity of having had to eke out the size of his strainers by hinged flaps.

Design N appears of especial merit, and very compactly arranged, with excellent supervision of departments and cells, and the only design we noticed which places the sergeant and inspector's apartments in separate flats on the first floor, which appears to give many advantages. It also shows a good scheme for future extension, with a simple, dignified, architectural treatment eminently in keeping with the purposes of the building.

The author was able to allow 10½ per cubic foot for the entire building, which gives a cost of £15,916, in addition to which the Armoury was not interfered with. An excellent quill pen perspective drawing shows the design to advantage.

The following gentle piece of flattery extracted from a local paper proves what extreme and general satisfaction is felt in the neighbourhood at the selection made:—"The first premiated design accepted being that of Mr. R. Burns Dick, architect, 55, Northumberland Street, Newcastle-on-Tyne, who is, according to the arrangement, entitled to the sum of £100; but the committee have decided to recommend him as the architect, and he will therefore superintend the carrying out of his own plans. The selection has given general satisfaction, and there is no doubt the new police premises, &c, will be an ornament to

WROUGHT IRON GAS LAMP FOR COUNTRY
INN. BY J. E. C. CARR.

the town, a credit to the architect, and a great convenience to the chief constable, the men under his charge, solicitors, press, witnesses, and others who will have to make use of them!"

THE danger which threatens one of the most beautiful spots in North Wales—the Aberglaslyn Pass—is now becoming serious. The project for constructing a light railway through the Pass has now received the support of the Carnarvonshire County Council. With only one dissentient a resolution has recently been passed sanctioning a loan to the company promoting the railway on condition that a free grant is received from the Treasury. The sole dissentient, Mr. Greaves, Lord-Lieutenant of the County, spoke strongly against the scheme. After visiting the route of the proposed railway he declared himself convinced that the railway would spoil the beauty of Aberglaslyn Pass, which he rightly described as "one of the great assets of the county during the summer months." It is to be hoped that before the Treasury makes a free grant towards the destruction of scenery which is in the best sense national property, the central authorities at Whitehall will satisfy themselves as to whether the line is absolutely necessary for the development of the district.

With Artists in Bermondsey.

IN a squalid part of Bermondsey, where the houses are small and the streets narrow, and both are dirty and monotonous, there can be found, standing in lonely dignity, an imposing block of red brick buildings, the premises of the Bermondsey settlement. Here there is now being held an exhibition of which comparatively few people have ever heard, and which yet is having a more genuine interest taken in it than many of those greater exhibitions which are the sensation of their time. It is the work of the boys and girls of the Board schools of the district of Southwark that is here laid out for inspection. There is no humbug in the manner in which the Southwark children appreciate this exhibition, says the Westminster Gazette. They go round it in animated groups of six or seven. And the whole half-dozen look at the same thing at the same time.

"AIN'T THAT DONE GOOD!"

or "This is all right, eh!" or "'E's a smart 'un, what!" are the sort of questions with which they incessantly hammer one another. But ask them to show you what they have done themselves, and see how excited they get. "Right, sir!" one of them will say, and march you off to his own peculiar corner. It will get buzzed round the room that "'E's asked Billy to show 'im what 'e's done," and you will be rapidly turned into a great personage, the centre of the admiration of half a Board school. Then you will proceed to ask a lot of stupid questions: "Did you really do that?" or "How was that done?" But no matter how silly you are, or how ignorant, they will be sure to say something good in reply. Then will come a bombardment. "Please, sir, this is mine," one will say, and another, "Please sir, this is mine," and a third, "Please sir, this is mine," and you will find yourself vigorously required to look at a dozen things at the same time. Your capacity for admiration will be tested, and you will be able to judge of the variety of your adjectives. But look these fellows straight in the eyes, and don't be afraid of putting your hand on their shoulders or giving them occasionally a dig in the ribs, and let them take you round the rooms. And while you find them

PUTTING LIFE INTO EVERYTHING

and making their unpretentious handiwork speak their language to you, just recall for a moment the character of the ordinary guide, whether at a Norman castle or abbey ruins, or a collection of Italian art, or an Egyptian tomb. These boys will show you some blocks of wood carved after the manner of Exercise I., and they will explain how the exercises grow gradually more difficult and more difficult. And at last they will reverentially bring you in front of a piece of carving by "the master" himself. They will show you "shadings from east," and explain earnestly and intelligently the meaning of that expression. Original designs for friezes and wall papers, pictures of horses and fishes' heads, and of lions and dogs, chisels, candlesticks, towel rails, photo-frames, inkstands, and writing-pads—among many other things, all these will be shown, with an anecdote about most and a joke about each. But don't let them omit to show you the sculpture of Clara Collins, of Sherbrooke Road School, fifteen years old, whose work, having gained the special merit prize, is to be sent for exhibition to Paris and Madrid. And finally, if you should see a little girl of ten, send her to try and find the picture of a horse hanging on one of the walls. Tell her that a little boy of ten drew that horse, and, unless you disagree with us, add that you wouldn't have thought anyone so young could draw so well.

At Macclesfield a museum, presented to the town by Mr. Pownhall Brocklehurst, of Macclesfield, and Miss Brocklehurst, has been formally handed over to the Corporation with public ceremonial. The building and endowment will cost the donors £10,000.

* The parade-room is not measured in cubic contents.

A SERIOUS INDICTMENT.

THE LONDON PLASTERER AND BRICK-LAYER ON TRIAL.

"A LONDON Architect" writes to several daily contemporaries, drawing attention to what he alleges is "a serious and scandalous state of things existing in the building trade." He says: "One duty of an architect is to see that his drawings and specifications are carried out in a proper manner, at a reasonable cost, in a given time, and, with these reservations, he is not directly concerned with the workmen who are employed and paid by the contractor; but it is at the same time obvious that in the supervision of the work upon the building he is brought into contact with the workmen, and cannot avoid observing the manner in which they perform their work and the time expended in completing it. I am at this moment erecting buildings in London, and I have taken the trouble to seek beneath the surface for some explanation of the time expended upon these works, and of the reasons assigned by the contractor for the delay in completion; and what I am about to state is the result of very careful inquiry upon my part, and I vouch for the accuracy of my statements. I select bricklayers, carpenters, plasterers, and plumbers; but, for perfection of

ORGANISED IDLENESS AND SYSTEMATIC ROBBERY.

I confine myself to bricklayers and plasterers. 1. The men I am referring to are paid the full and beyond the full union rate of wages to work the agreed number of hours per day. 2. A large proportion of these men do not present themselves on Mondays, and on Tuesdays they are not able to work properly, as they are recovering from the effects of a carouse which has lasted from mid-day on Saturday to the morning of Tuesday. 3. They come on a job for a few hours, say that it does not suit them, and obtain their wages for having upset the calculations of the foreman and done more harm than good. I know of bricklayers coming on a job and working for an hour—get their money, and say, 'We only wanted the price of a drink.' 4. They practically determine who shall and who shall not work on a job, and hold before the builder the threat of turning out bodily if their demands are not complied with. 5. They do not return more than one-third of real honest work for the full wages they receive, they resent the interference of a foreman who has the courage to complain; this resentment is sufficiently strong to constitute intimidation, and a foreman now hardly dares to do his duty. 6. There is distinct

AGGRESSIVE CONDUCT

on the part of the men, and they loiter on the building without any attempt to disguise their idleness. It may at once be retorted, "Why not put a stop to all this?" But it is more easily said than done, because there is at this moment a great demand in London for bricklayers and plasterers; therefore the men can walk from one job to another with the certainty of finding immediate employment. By a little concerted action, however, I think we can bring the plasterers to book, and keep them off the buildings altogether. I intend, in my next piece of work, to make the attempt in the following manner:—1. Use thin fibrous plaster slabs for ceilings, and canvas and paper them. Another set of men altogether can fix these slabs to the joists. Large quantities of these slabs could be obtained from Germany and Austria. 2. Use wood cornices throughout, in place of plaster, as they used to do in the good old days of Queen Anne. 3. Use wood-moulded panellings to walls or batten and canvas them as in days of old. As to the bricklayers, I can only invite the out-of-work tramcar men and labourers to devote a fortnight to acquiring the art—a man of ordinary physique and intelligence can, I am quite certain, lay bricks in that period quite as well as I sometimes see them laid by so-called bricklayers. The wages earned by these tramcar men could be doubled, and the bricklayers would be brought to their senses. I

must apologise for the length of this communication, the difficulty being to bring in a short form before the public anything like a picture of the true state of things on the buildings; but I am convinced that if architects will unite their efforts with those of the builders, it would not take long to secure a very large reduction in the price paid for, and the time taken in, the erection of buildings in London."

CORROBORATIVE EVIDENCE.

"An Architect" writes in corroboration of the above statements. "Of the two trades referred to," he says, "plasterers are, in my opinion, the worse. They show an absolute indifference to the amount of time and money they waste by their absence from work without notice, and the minimum amount of work they get through when actually employed. The extra cost of work involved must necessarily fall eventually on the public, who have to pay the builders, and I do not think it would be too much to say that the cost of building is nowadays increased to at least 25 per cent. more than it should be by this shameful state of things. The drink this branch of workmen gets through must be appalling, and the bricklayers run them very close. In my twenty years' experience I have noticed the gradual decrease in the number of bricks laid by any individual man. I can remember 800 to 1000 being considered a good day's work, but now 300 to 400 is as many as any ordinary bricklayer will condescend to lay, and that notwithstanding the increase of wages and shortening of hours of labour."

THE PLASTERERS' REFUGE.

Mr. George Stanley, of the Fireproof Construction Company, 132, Wool Exchange, E.C., writes:—"I can fully endorse your correspondent's remarks in reference to plasterers' scamping, idleness, and boycotting. Architects have long felt the want of a new idea to take the place of some of the work now done by this branch of the trade, and although my firm manufacture plaster slabs to be fixed by carpenters, and plastered over afterwards, we cannot get the plasterers to do the work themselves, and they will not allow carpenters to do the fixing. Consequently jobs are delayed, and we are daily losing work for which we have already specified through not being able to get the plasterers to work or allow others to do so. We have offered men work all through the winter with like results, owing to their being backed up by their trades union, which these men hide behind, and give the excuse that the union will not allow them to do this or do that. The consequence is that the artisan of to-day is not allowed to work in a conscientious way, for if he puts in his full work and does it well he is immediately boycotted by the other branches of the trade, and, therefore, has to reduce the quality and quantity of his work to the level of the lowest or worst work on the job."

"A REIGN OF TERROR."

"Surveyor" says: "We have enjoyed an extensive practice, covering a period of over fifty years, and at the present moment there are over forty buildings in progress with which we are connected, and we consider it under the average if less than £400,000 pass through our hands for building purposes during the year. The British workman employed on buildings in London has discovered a method of robbery which is not amenable to law, and very excellent uses he has made of it from his own point of view, no doubt. Year by year his laziness and insolence increase, and during the past three years in London builders have experienced a "Reign of Terror," and in order that it may be quite clear to you—the modus operandi—we will describe one method adopted by bricklayers. In bricklaying the line is stretched from point to point, so that courses of the brickwork may be truly laid. If a union man be working on one side of a wall and a free man on the other (i.e., a bricklayer not belonging to the union), he (the union man) will dawdle on his side to prevent the line being raised until it suits his goodwill and pleasure. Should the foreman stand and look at the men at work he is told they "Don't want foxing," or is asked, "Ain't we doing enough for you?"

and should he commit the awful crime of telling them not to handle bricks quite so long, or endeavour to coax them to do a fair day's work, he is, in the majority of cases, anathematised, and wages are instantly demanded. If possible, the other trades are persuaded to leave that particular job, the foreman being characterised as a nigger driver, the motive being a vindictive one, as very few contracts are signed without a clause imposing a penalty for non-completion within the stipulated time. Twenty-five per cent. advance in prices is a moderate computation, the price in brickwork has more than doubled in ten years, and where bricklayers will not lay more than 400 bricks per day on a thick straight wall at so much per hour, they will lay from 1000 to 1200 if paid by piecework. The invitation to learn bricklaying might be extended to any able-bodied man who is underpaid. Any ordinary man could learn bricklaying in a fortnight, plastering in one month, carpentering in six weeks, leaving the special portions to flue hands, rubbed and gauged workers, cornice hands, and so forth to the special men as now, leaving the foreman to set out obtuse or acute angles."

FOR THE DEFENCE.

A "London Carpenter" writes:—"Is it not the case of silk hat versus the cap and apron caste prejudice? These gentlemen who write to you have no practical knowledge of the works they undertake to superintend. It is but a question of supply and demand. If the offspring of working men, in deference to the spirit of the times and their mother's feelings, are brought up to be theoretical architects in the Board schools, instead of practical workmen with an indifference to dust, dirt, and danger, why, presently there will be more architects than navvies; and then, I suppose, my fellows will only "work" one hour a day—which will very much "upset the calculations of their superiors." Your correspondent's indictment is mainly true; that I admit, but can it be remedied? No; not even if all the out-of-work horsekeepers learn to be capable bricklayers at a night school in a fortnight and thereby double their horsekeepers' incomes, and make the regular bricklayer hang his head with profound shame."

SUMMING-UP.

In commenting, in a leading article, on "A London Architect's" letter, the Daily Telegraph observes that if it be "even but partly justified by facts, it brings a very serious indictment against the London bricklayers, carpenters, plasterers, and plumbers. Considering how numerous and useful these specimens of the British workmen are, a charge made against the whole class is one which must not be lightly framed or hastily accepted. However, it is for the men themselves to defend their credit as honest Britons, and only for us to state what are the accusations brought against them. The correspondent is an architect in extensive practice, having a great deal to do with workmen, and constantly shocked, as he says, by the delay in the execution of contracts caused by the idleness, the insincerity, and what he even calls 'systematic robbery' on the part especially of bricklayers and plasterers. . . . Now, these allegations are either true or false, or, more probably, partly true and partly false. The experience of other directors of London labour is wanted to confirm or to put aside such very grave charges, which, however, are so evidently made in earnest and with conviction by the London architect, that he goes to the length of suggesting substitutes for lath and plaster work, which would enable builders to dispense in a large measure with the bricklayers and plasterers. Wood cornices, wood-moulded panelling, and fibrous plaster slabs for ceilings, would, he thinks, spoil the market for the easy-going gentry who can now stroll from one job to another with a certainty of finding unquestioned employment, because the building and decorative trades are so busy. Indeed, the London architect must have been terribly vexed by the irregularities and immoralities which he says exist among the workmen of the Metropolis, as he proposes, in addition, a most drastic remedy.

He invites the out-of-work tramcar-men and labourers to devote a fortnight to acquiring the art, for a man of ordinary physique and intelligence can, he is quite certain, lay bricks in that period quite as well as we see them laid by so-called bricklayers. Another architect corroborates these accusations to-day, adding that 'the cost of building is nowadays increased to at least twenty-five per cent. more than it should be by this shameful state of things.' What have the other master builders, architects, and contractors to say upon the subject, and, above all, what do the men say for themselves? We should be very sorry indeed to believe that the accusations could be generally borne out by the testimony of other authorities, but most of all grieved if it were proved by their silence or heedlessness that the London workmen themselves were indifferent to such slur thrown on their honesty as a body. If these charges are only partially justified—if it is not an uncommon thing for the London labourer to take no manly pride in his work, to scamp it, and to sneak his pay, and lose a day in the week for drink and laziness—then we should be obliged to think very badly indeed of the average British workman. But we are quite sure the average British workman, even if he be a bricklayer or plasterer, is not so black as he has here been painted; and we hope that the echo of such serious indictments will have the effect either of sweeping them away or of shaming the consciences of those who are guilty of the meanness and fraud of shirking their lawful and promised labour."

THE sarcophagus for the late Prince Bismarck, which the Kaiser has commanded the sculptor Begas to execute, will be of an elaborate character. On the sarcophagus the figure of the Prince will rest with bare head, attired in the uniform of a cuirassier, the body partly covered with the German flag. Beside the pedestal a dog will watch the body, thus symbolising Fidelity. In a niche above the sarcophagus is seated a weeping woman, typifying Germany's sorrow. On the right is the statue of a man representing Strength; on the left, a figure of Justice carrying a sword.

STREET DEFACEMENT.

A PROTEST FROM LIVERPOOL.

STRONG protests against the newly-proposed system of tram haulage in Liverpool were made at the first ordinary meeting of the fifty-first session of the Liverpool Architectural Society, held last week under the presidency of Mr. W. E. Willink, president for the second year. At the opening of the proceedings, Professor Simpson, the honorary secretary, mentioned that it had been found impossible to make ready the programme for the session in time for that meeting, because several dates had not been filled up, but viewing the titles of the papers, &c., that had already been promised, he thought they might look forward to a very pleasant and successful year.—The President then delivered his opening address, and after thanking the members of the society for again appointing him president, touched upon the relationship that should exist between ARCHITECTS AND THE LOCAL MUNICIPAL BODY and also the public. In regard to the erection of public buildings, he quite agreed that "those who paid the piper should call the tune," yet, as he remarked, "supposing the builders did not know the music," was it not reasonable to contend that municipal authority should intervene, and prevent any addition to the already unseemly aspect of Liverpool streets? Although such a position would prove a thorny theme, he expressed the opinion that the Corporation should appoint an official who would be empowered to watch the erection of buildings offensive to the eye. Alluding particularly to the neighbourhood of Sefton Park, the President said that there were to be found edifices of all sorts and sizes, and the opportunity of preventing the erection of them had passed away. In regard to the relationship between

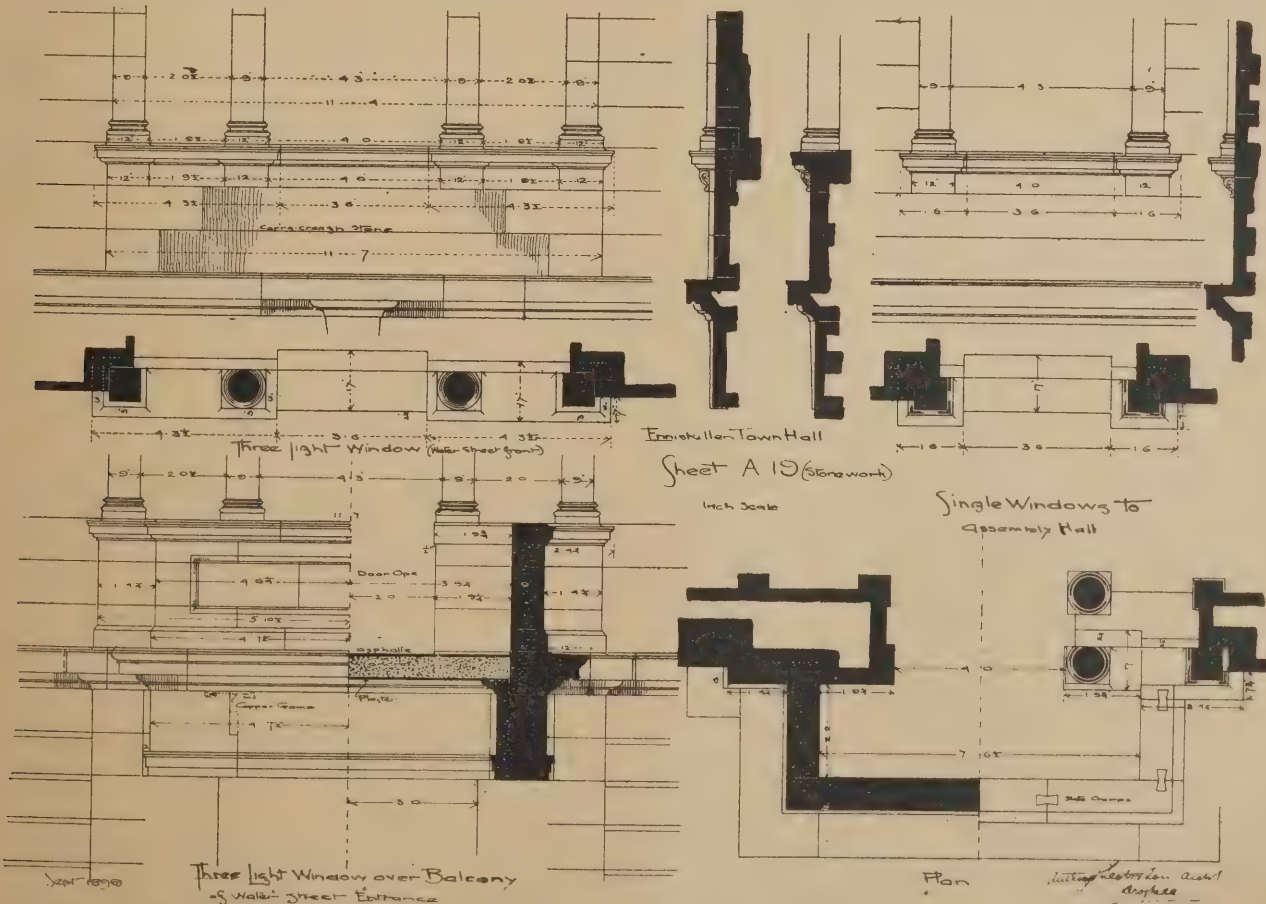

ARCHITECTS AND THE PUBLIC,

he thought that the taste of the latter concerning the erection of dwellings was constantly advancing and rising, and the time would come when the opinion of "the man in the street" would be a powerful factor in forming their views, as architects, as to what

was needed. Their aim should be to cultivate a warm and close sympathy between the public and those who served the public in the region of constructive art.—Mr. Henry Hartley (vice-president) proposed a hearty vote of thanks to Mr. Willink for his address. It was thought that the president might have expressed an opinion on the matter of the tramways and the system of erection that had been adopted. That day the members of the Society had had the opportunity of viewing the tramway system from the Dingle to the Custom House. He did not hesitate to say that anybody interested in the beauty of our streets would, after traversing that route, conclude that the arrangements were distasteful and beauty-destroying in every manner and form. There were posts on each side of the streets with cross wires and other wires running horizontally, and he could not imagine anything more offensive to the eye. He hoped that they would have the advocacy of Mr. Willink in seeing that the surroundings of the city were not further defaced by the new system. Speaking to a member of the City Council on the subject, he had been told that what was aimed at was

PRACTICABILITY AND NOT BEAUTY.

That, he considered, was a very mean way of looking at the question, for he felt that in all their practical aims they should endeavour to give the people something pleasing and attractive.—Mr. George Bradbury, in seconding the motion, said that, in regard to the tramway system, one felt horrified at the prospect of Liverpool becoming a second New York. They were now having hideous poles erected through the main thoroughfares, and eventually, perhaps, might find an overhead railway running across the principal open squares of the city. It was clear that we were drifting towards the New York style of locomotion. They could not take a calm and quiet view of these things as if they had no influence whatever, but should offer some protest against the defacement of the streets. It was formerly suggested that a memorial be sent to the City Council protesting against the erection of the poles, but nothing had come of the idea. He was of opinion that if an objection was lodged it would have some effect.—The motion was carried.

DETAILS AT ENNISKILLEN NEW TOWN HALL. MESSRS. ANTHONY SCOTT AND SON, ARCHITECTS. (See Inset Supplement.)

Photography for Architects.

MR. G. A. T. MIDDLETON, A.R.I.B.A., writing in the *Amateur Photographer*, remarks that a great deal is heard of photography in its application to medicine and surgery—of the assistance which it renders to the astronomer and the microscopist; by many others than specialists it is employed to obtain records of old buildings, curious towns, and picturesque bits of landscape. Yet comparatively few professional land surveyors, and still fewer professional architects, are alive to the help which it is capable of affording to them in their ordinary work-a-day business. That it is of such value, the few who have employed it have proved without doubt, going so far as to say that for the surveyor, at least, a knowledge of photography is as essential as an acquaintance with the theodolite.

THE OLD NARROW VIEW

of a surveyor's duty was that he had to make plans and sections of the land he surveyed, accompanied by a written description of its characteristics; the modern, broad view, that he is not only to lay down its exact configuration, but by every means in his power render others who have not been technically trained as fully conversant with all the peculiarities of the surveyed country as he himself. To obtain this end, a series of photographs taken from well-selected points of view, whose positions, as well as the direction in which the camera was pointed, are marked on the scale plan, is of the very greatest assistance; and if Colonel Stewart's rotating camera be employed, not only is the entire panorama secured, but a most accurate check obtained upon the theodolite working—so thorough, indeed, that in cases of extreme haste the theodolite can be dispensed with, and even entirely superseded in instances where the natural conformity of the ground, as in very mountainous countries, makes the recognition of the same spot from two points of view a matter of difficulty, amounting almost to impossibility where memory and rough sketches alone are trusted to. There was

A PROMINENT INSTANCE

of the value of photographs as supplementary to a land survey a few months ago, when architects were asked to submit plans in competition for a new university at San Francisco. The site was an extraordinary one, at the foot of the Rocky Mountains, and rose no less than 700ft. in a trifle over a mile; and of this a plan was, as usual, supplied to intending competitors. On application, however, they were also supplied with a scale model of the land, and a series of photographs. These would undoubtedly have been more useful had they been panoramic, or even had the directions in which they were taken been more clearly indicated than was the case, but, even as it was, they gave a very good idea of the topography, and especially of the way in which the character of the land altered at its different altitudes, and of the views obtainable. At first sight, it is, perhaps, not quite so obvious how photography can be of value to the architect as to the surveyor. Yet it is even so in even a great variety of ways. In crowded cities particularly it is of the utmost importance before commencing building work to ascertain and record what is existing on the site and what is surrounding it before commencing operations, having regard to possible legal complications, actions from neighbouring owners for infringements of rights of light and other easements, and many other eventualities; and in such cases the

EVIDENCE AFFORDED BY PHOTOGRAPHS

from well selected points of view, and taken with suitable lenses, in conjunction with proper plans and models, is most important. By themselves, however, the value of photographs as evidence is liable to heavy discount in court, as many judges, and juries also, have become sceptical of the truthfulness of the impressions conveyed by them, owing to the occasional unscrupulous use of specially wide

or narrow angled lenses, for purposes which are sufficiently obvious. Of equal importance are photographs of shoring and underpinning work, and of all work which is to be covered over, and about which disputes of one sort or another are by no means infrequent, owing in the majority of cases to the absence of evidence such as a photograph would supply; and almost invariably when bad work is condemned, and ordered to be reinstated should the camera be used, for the purpose of after-reference if necessary. When work is being carried out at any such distance from the architect's office as to render personal constant supervision impossible, the clerk of works, by supplying photographs, can keep him in touch with what is going on, and by their means a client can often be informed as to the progress of the building for which he is paying in a manner most satisfactory to all parties.

NEW TOWN HALL AT ENNISKILLEN.

THE design for this building, which we illustrate to-day, was selected in competition about twelve months ago. The building is now in course of erection, and will probably be completed next year.

The usual municipal offices are arranged on the ground floor, comprising reading-room, clerk's office, chairman's room and council chamber, minor assembly hall and committee room, and gentlemen's lavatory. The caretaker, heating chamber, stores, and fire brigade are disposed in the basement. On the first floor are situated the large assembly hall, stage and dressing rooms, committee room, borough surveyor's office. The Masonic Hall and ante-room are situated in the attic of front.

The style of the building is Free Renaissance. General facing is of fine punched Carrara-marble limestone, which is a kind of black marble, and with dressings of Dungannon, a cream-coloured sandstone. The roofs are to be covered with Westmorland green slates, with lead hips and ridges. The roofs of tower and ventilating fleche will be covered with 16oz. copper.

The works are now in an advanced condition, almost all of the walls being to the full height. It is expected that the building will be roofed before the severe weather sets in.

The entrances from both streets lead directly to the spacious staircase hall. The stairs are to be constructed of fireproof materials, as also are the whole of the corridors and passages and lavatories. Fire extinguishing apparatus will be arranged in both staircases, where there will be control of all the rooms; and the staircases and exits are so arranged that no danger will reasonably occur from panic.

The heating is to be on the warm air system—the cool, fresh air, taken from each street by ducts under the ground floor, passed through the furnace chamber, and thence by air flues in the walls to each of the different rooms, where its entrance will be controlled by regulating valves. The ventilation is to be effected by inlet panels in addition to the warming apparatus, and extracted at the ceiling and conveyed in trunks to the central upcast shaft in the fleche. The offices are provided with exhaust ventilators, having separate air flues built in along smoke flues and carried up to near top of chimney.

The design is by Messrs. Anthony Scott and Son, of Drogheda, under whose superintendence the works are being carried out. The contractor is Mr. James Harvey, of Enniskillen.

PRESIDENT CARNOT, who met his death at the hands of the Anarchist, Caserio, is to have his monument at Lyons. The statue, which is to be unveiled next year, will be of an elaborate character. It will take the form of a pedestal surmounted by a pyramid. A figure in marble of the assassinated President will be placed in the centre of the monument; above, will be the Genius of France saluting the flag; below, the arms of the town of Lyons; behind, a lion looking towards the place where Caserio accomplished his crime.

Enquiry Department.

THE STUDY OF ARCHITECTURE.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I am engaged at granite works in Westmorland, and I find it impossible to attend any classes in architectural drawing, colouring, &c. I am very anxious to pursue my studies in these subjects, but I am at a loss what books to study. I should much appreciate your advice.—Yours faithfully,
E. S.

We would recommend you, in pursuing your studies in Architecture, to procure the general guidance of someone who is already proficient. If you cannot arrange this in any other way, there are in London several competent coaches (whose names you will find in this and other professional journals) who will direct your studies by correspondence for a small fee. If you rely entirely upon yourself you will waste much time in acquiring matter that is of no importance or value. Of books, you should possess Quitt's "Encyclopædia of Architecture" and "Building Construction" (Rivington). For a study of the classic orders, we know no better book than that edited and arranged by Mr. Phene Spiers, and published by Batsford, Holborn. For opening your studies in Gothic Architecture, Parker's "Glossary" is a most useful book.

Correspondence.

TECHNICAL EDUCATION GRATIS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—In my opinion the London School Board have gone a step too far in making their Evening Continuation Schools entirely free. Amongst those who take advantage of this are many who are in a position to pay something towards the cost of the classes, and why should the London rate-payers contribute towards the cost of teaching carpentry to those who are learning it as a hobby? That technical education should be free to those connected with the various trades, and who wish to improve themselves by attending lectures and practical instruction, I do not wish to deny; to keep up with our foreign competition such things ought to be, especially for the learners, who have less chance than ever, owing to the subdivision of work, of gaining a proper apprenticeship in the trade they have chosen. But when I see clerks, draughtsmen, schoolmasters, and the like attending classes in woodwork, I feel that the thing has been carried a little too far. There are, and always were, plenty of classes at the Institutes and Polytechnics, which may be entered at a very moderate fee, open to those who care to avail themselves of the opportunities presented. It cannot be argued that these "craftsmen" do any good to the workmanship of the country; I am perfectly certain they do not learn enough to keep any tradesman out of a job—in fact, I sometimes have come across extra work made through their amateur work—so no tradesmen need look upon the classes with a jealous eye.

The only advantage gained is that they learn to appreciate good work, but even that does not say they will promote good work by learning to pay good prices.

I would suggest that those who have incomes over a certain fixed amount, say, £100 per annum, contribute towards the expenses of the classes by paying a small fee. This subject will not have very great attention till the cost is totalled up in due course, and then we shall hear all about it. Why not look to the whole business before then?—Yours truly,
"Z."

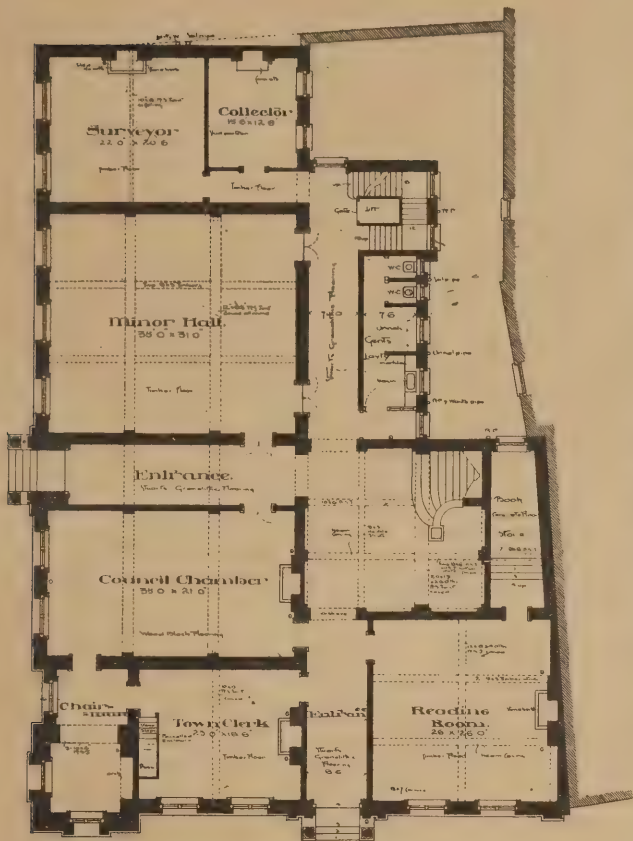

MESSRS. GREGORY BROS. are about to erect a large house at West Hill Park, Woking, from the designs of Mr. J. Wilson Wright, architect, Anthony.

THE ARCHITECTURAL ASSOCIATION.

INAUGURATION OF THE WINTER SESSION.

PRESIDENTIAL ADDRESS.

THE session 1898-9 of the Architectural Association was inaugurated on Friday night. The Association commences the winter term full of hope and vigour, and with an admirable President in the person of Mr. G. H. Fellowes Prynne, F.R.I.B.A., at its head. The adoption of the annual report and balance-sheet was the first business item of the new session, and following it came the distribution of prizes to this year's winners of the respective competitions. We have already published the list of successful students, and, passing over the annual report until our next issue, we come to the President's address. It was as follows:—"In addressing you this evening I feel my first duty is to thank you for electing me to the honoured position of your President for the ensuing year. In accepting that important and responsible position, let me assure you that my heart is thoroughly in my work, and it will be my first and last aim to pass on the good traditions of this chair unsullied to my successor. With regard to the custom, your President's annual address, it may be looked upon by many as a necessary evil, and, perhaps, by none more so than the President himself. However, custom it is, and I maintain on the whole

A HEALTHFUL CUSTOM,

as although involving almost necessarily some repetition, it enables us to look at things from a somewhat different point of view, it may open up some further field for thought, and again it may perhaps, from year to year, help to inspire or to rekindle enthusiasm for the great work being carried on by the Architectural Association. Having completed our fifty years' life as an association and entering now upon the first session of a new decade, we are in a measure able to review the past with considerable satisfaction, and, with past experience to guide us, to look forward with every hope of even greater success in the future. The very useful review of the history of the Association given in your late President's address renders it, I am glad to say, unnecessary for me to dwell further upon the historical side except only as far as it touches upon the progress in the educational work of the Architectural Association. The

FIRST OBJECT OF THE PROMOTERS

of the Association was perhaps necessarily a somewhat limited one, and it must be a source of no small gratification to Professor Kerr and Mr. Arthur Cates (now our oldest member), and other of the promoters who are still amongst us, to whom we all owe so much, to see the vigorous plant that has grown from the small seed they planted and nourished with so much care fifty years ago. Whilst we should never lose sight of the debt of gratitude we owe to the first promoters of the Architectural Association, yet I feel sure that they will be the first to acknowledge that the good work they started has been well carried forward by many able workers, to whom we owe an equal debt of gratitude; and more especially to those who were the means of bringing about the great revolution in our mode of work, and launching the new scheme of education. Useful as the educational work of the Association had been up till 1891, and successful in many ways as had been the results of the noble and generous voluntary support given in teaching and otherwise—and again, whilst it cannot be denied that the enthusiasm inspired amongst students was as great, if not even greater,

UNDER THE OLD VOLUNTARY SYSTEM,

more especially in such sections as the old Class of Design, yet undoubtedly with the rise of numerous Schools of Art, and the demands for systematic education in every branch of art and science, it became absolutely necessary

if we were to maintain our position as an educational body, that our whole system should be worked upon more methodical lines than heretofore; and further that our educational work should not be dependent solely on voluntary effort. How much this great need was felt by those most interested in our welfare, for many years before its accomplishment became possible, is purely a matter of history. With what care and surprising thoroughness the new scheme was at last launched, and became a living factor for good, under the able direction of our energetic past presidents, Mr. Stokes and Mr. Baggallay, and no less energetic secretaries, Farrow, Gale, and Goldsmith, we have ample evidence in the original curriculum. This curriculum was at once simple and comprehensive; and the fact that so few alterations to the original scheme have been found necessary, speaks wonders for the care and insight of its framers. Such changes as have been made from time to time are the outcome of experience in actual working, and that further modifications will have to be made in the near future is more than probable. Good as our start

IN THOROUGH EDUCATIONAL WORK

has been, we do not for a moment think that our system is yet by any means perfect. Indeed, there are palpable deficiencies, and especially as regards the technical and practical branches of our work, upon which I shall say a few words later on. You will, I hope, agree with me when I say that it is not well that we should always be looking only at the bright side of the picture. There is certainly another side, and it is much better to face it; and as it is a matter that affects the whole body, I trust you will forgive me if I state certain facts concerning the work of the last few sessions. One of the greatest disappointments is perhaps in finding how few students comparatively work through the four years' course proposed by the original and still recommended by the present curriculum. It is very hard to judge exact results by figures only, as a majority of our students take up various subjects, the studio work, or especial courses of lectures separately. I will therefore not attempt to compare averages, as it would probably be misleading; nevertheless, it is

DISTINCTLY DISAPPOINTING

to find that out of all the students who have joined during the years 1891 to 1894 and 1895 inclusive, only eighteen have taken the complete four years' course. Of this number seven students commenced their studies in the session 1891-92; five in session 1892-93; five in session 1893-94; one in session 1894-95. These figures at least indicate that the four years' course is either not generally popular amongst students, or otherwise that the majority of students do not under our present system of pupilage find it practicable to carry forward a regular four years' course of A.A. instruction in addition to their other work; and it must not be forgotten that the more industrious and ambitious students, or those with more time at their disposal, are tempted, and I think wisely so, to join the Royal Academy Schools, and carry on the R.A. work conjointly with that of the Association. This in itself may to some extent tell against the success of

THE FOUR YEARS' COURSE

originally proposed. What do we learn from the experience of our various divisions of work? When the work was divided into four divisions, it was Division III. and IV. that were poorly attended; when the work was rearranged in three divisions, it was Division III. that languished, and now that the curriculum is once more modified, and excellently arranged for the complete work to be included in two divisions, it is in the advanced classes of Division II. that there is still the greatest falling off. Indeed so much was this the case during the last session that the committee have felt that it was desirable to remove the valuable lectures on general history, and those on stresses and strains from Division II. to Division I., and to make land surveying, originally in Division I., one of the extra subjects. This will perhaps tend to make the

lectures in Division I. still more popular, and we hope at the same time increase the attendance at the remaining classes in Division II. But I am not confident that it will altogether solve the problem as to why it is that the majority of students do not follow on

THROUGH THE ADVANCED CLASSES.

Personally, my view is that, taking into consideration the present system of pupilage and other difficulties that beset the architectural student, a four years' course, unless under a regular college system, is too long, and that a curriculum drawn up for a three years' complete course would be more popular and successful: not that I think four years under regular systematic work too much—*per se*—but when supplemented by office and other work, it becomes impracticable. In saying this, I am aware that it is possible for a student to cram through the lectures and other classes in two years, but in doing so he must miss much of the studio work. This course cannot be too strongly deprecated. That it is resorted to by some as a means of cramming up for and passing the R.I.B.A. examination in a limited time, is, I regret to say, only too true. Again, it is found that many students, after passing through Division I., go

TO A PRIVATE TUTOR

for getting up the advanced subjects, with the same object. It is, I fear, one of the inevitable evils of this otherwise most useful examination, that students are tempted to consider the passing of this examination the goal of their ambition, and to make the historical, theoretical, and scientific side of architecture the main feature of their studies, too often to the detriment of the practical art and craft side of their education. Whilst I am most firmly convinced that the reading, the study, and the preparation that is necessary for these examinations is simply invaluable to the student as a means to an end, and that even the examination itself may be, and is, in many cases, an incentive to work, yet one cannot but deplore that

THE PASSING OF THE EXAMINATION

is the end far too often worked for, and not architecture. There are certain peculiarities I have particularly noticed about the man whose only or principal qualification to being an artist is the passing of the R.I.B.A. examination, as opposed to the artist who uses the examination, as it is intended to be used, as an accessory to his art—the former invariably wants to tell you all about it—he has a wonderful liking to discourse upon his book-learned art to others, and is sublimely critical as to what is and is not correct in style, &c. For fear of being misunderstood, however, let me repeat that I believe the R.I.B.A. examinations, within limits, to be a great lever for good, both as an incentive to study and as a test to study. If these examinations are not, as they never should be considered, or thought of, as a test of art, they may, I think, in a measure, be fairly considered as a certain qualification in the very necessary

SCIENTIFIC SIDE OF OUR ART.

But having said this, I feel I am only expressing the views of all who have interested themselves in the educational work of the Architectural Association when I emphatically assert that in no way whatever do we as an educational body encourage a system of cramming students for the R.I.B.A., or any other architectural examination; and we most strongly deprecate the idea of our classes being used for that end, to the detriment of the studio work, which, as I have before said, must of necessity be the case if students attempt to confine their studies to a two years' course. No, gentlemen, the whole scheme of our educational work is based upon a much firmer foundation than is involved in cramming. It was the aim of the framers of our new scheme, and the great desire of those who have carried on that scheme, to lay a solid foundation of elementary education, and to build up gradually a superstructure, that should be as perfect in its parts as we could make it; and in this system was it, do you

think, for one moment desired that historical, theoretical, or even scientific study should be

THE BACKBONE OF THE WORK?

Surely not! The studio work, and all that is involved in it, I venture to say, was intended to be the backbone of all other study—and that the subjects therein taught should throughout be worked conjointly with the lectures, classes, or divisions. It is here that a student will first learn to express his thoughts and ideas with his pencil—it is here that he will learn the beauty, relative proportion and value of ornament and mouldings—it is here that he will be able to formulate his ideas into actual working formula—it is here that he will be able to test the value of what he has learnt in other sections—and last, but not least, it is in the studio that he will learn the fundamental principles of design, and, having gained confidence in himself, will have many unrestricted opportunities of showing that

INDIVIDUALITY IN DESIGN,

which I trust it will ever be the object of the Association to encourage. It is for these reasons I say that the studio work should be considered by our students as the very basis of all other work. Amongst our many really able instructors, it would seem invidious to pick out any one name, when all, in their particular spheres of work, are so thoroughly good, was it not for the fact that I am now more particularly dealing with the studio work, but I think all who know Mr. Lewis will agree with me that he is simply *facile princeps* in his position as studio instructor. Whilst speaking of the value of studio work I want to take the opportunity of calling very special attention to one important section of it—I refer to the School of Design. In the August number of Architectural Association Notes you may have noticed that I took the opportunity, at the request of the committee, of inserting a short note upon what in our new Brown Book we call the School of Design and Handicraft. Our older members will remember how popular was

THE OLD CLASS OF DESIGN

in years gone by. I have previously referred to the enthusiasm in connection with this class under the old voluntary system. Many men, who are now in full-blown practice, will remember, with feelings of gratitude to the Architectural Association, the great help this old class of design was to them in their early days, and I am sure I am only expressing the feelings of many when I say I shall not only remember the class with feelings of gratitude for the good I obtained from it, but with feelings of affection for the many friendships that resulted from our social intercourse and friendly rivalry. Now, this is the class in our present system that binds us most closely with the past. It is this class that is most closely allied to the voluntary system of teaching. The instructors, or, to be more correct, I should say the visitors in this case, give their services freely and ungrudgingly for the good of the cause as of old, yet withal I regret to say that we have

TO DEPLORE & FALLING OFF

in this School of Design, both in membership and quality of work. It has puzzled the committee a good deal to try and find out the real cause of this general falling off. It surely cannot be that there is less enthusiasm amongst students for this all important branch of study. I do not believe for a moment that there is now less ability among our students than at any previous period of the history of the Architectural Association. On the contrary, there is every reason to believe that with all the advantages we have been trying to heap up for the future happy student of the Architectural Association that we comparatively old fogies shall in another decade be left far behind, and be looking on with wonder and astonishment at the freaks and fancies of the twentieth century style—what shall we call it,

THE CONGLOMERATE STYLE,

invented by those geniuses we hatched and nourished with so much care in the folds of the Architectural Association. But joking aside—it is my earnest hope that this School

of Design may be a great success during the present session, and in expressing my own wish, I am, of course, only speaking as chairman on behalf of the committee. Feeling that the fee of £1 1s. might be the real stumbling block in the way of many who would otherwise join, the committee have, and I think most wisely, decided to reduce the fee to the nominal sum of 5s. in both the elementary and advanced class of design. I trust that this inducement alone will be enough to make the class more really representative of the work of the students of the Architectural Association. One can only hope that on the principle that you value most what you pay most for, that students will not value less what they are paying so little for. The very name, and the object of the class, should of course in itself be

AN AMPLE INDUCEMENT

for any enthusiastic student to join. If, however, further inducement were needed, surely a glance at the list of names of visitors who, although all busy men, are ready to give their time, energies, and experience, freely and voluntarily for the good of the students, should be sufficient. I will not now say more on this subject, except to add that the committee will watch with hopeful interest the result of its endeavour to meet the convenience and requirements of the students in every possible way. We now come to the latter part of our title: "School of Handicraft." This question is so mixed up with that of premises that it is hard to speak of them apart. Undoubtedly the want of success in this branch of our work is owing to the want of

TECHNICAL AND DEMONSTRATION WORKSHOPS

in our own building. This being quite impossible at 56, Great Marlborough Street, the committee in past years obtained permission for students to attend various workshops and Polytechnics. The results are not encouraging, and personally I think the reasons are obvious. Suffice it to say at present that during the past session not a single student applied to be allowed to attend the Trades Training School, or the Battersea and Chelsea Polytechnics. Twelve students, however, attended the masonry and leadwork classes at the Regent Street Polytechnic under the direction of the L.C.C. Technical Education Board. But twelve out of 176 students is indeed a small proportion. I suppose that amongst the average students of the present day there is no need more conspicuously apparent than the want of thoroughly practical knowledge of materials and their proper treatment constructionally and otherwise. Our lectures and instruction on theoretical construction are, of course, very valuable. But practical demonstration in a workshop by an expert mason, carpenter, bricklayer, and plumber would be of equal, if not greater, value to the young student, and is in any case

A VERY NECESSARY ADJUNCT TO THEORETICAL STUDY.

The advice given by the late Mr. Street to a father who wished to send his son to him as a pupil was: "Please send your son to the workshops of a good builder for a year before sending him to me"; and I feel confident that this was sound advice, and I only wish that it could be more generally followed within certain limits in places where other means of practical training are unattainable. We all know what severe and prolonged workshop training is considered necessary for a civil or mechanical engineer. In a modified degree, it is not one bit less necessary that an architect should have a similar training as to the quality, uses, and correct treatment of the materials he has to deal with in various kinds of building. It is simply deplorable, comparatively speaking, how little really practical knowledge of this kind exists, and, what is worse, how little it is sought for amongst the great majority of students. This is not of course an evil by any means confined to the present generation only. The haphazard system of

LEARNING TO BE AN ARCHITECT

by means of office and class training, and picking up the practical craft side as best you can, has been quite as much an evil of the past as it is of the present day—with this

difference, however, that at the present time the facilities for practical craft training are so much greater than they were a few years ago, that there is less excuse for students not profiting by their numerous advantages. I am not for a moment urging that an architect should himself become a perfect craftsman in all trades. With the many qualifications that are considered requisite for an architect, life is far too short for such an ideal; but I do assert that an architect, worthy of the name, should have such a personal

PRACTICAL KNOWLEDGE OF MATERIALS

and actual workmanship, that he can always utilise the former to the best advantage, and correct the latter, when defective, in all trades; to do this he must gain his experience on the actual building or by practical demonstration in the workshop. It is for this reason that I sincerely hope we shall before long see proper demonstration workshops in direct connection with, if not under the same roof as, the present or future Architectural Association premises. Until such arrangements can be made, I do hope that a larger proportion of the students will join such Polytechnic or other technical classes as they may find most convenient, and that all will take every possible opportunity of visiting various works in progress wherever possible. Principals can in a great measure

HELP FORWARD THEIR PUPILS

in this way, by allowing them continually to visit works they may have in hand, whereby the pupil can study the plans and details and building together. And further, I feel sure that there are many architects who have sufficient interest in the education of their younger brethren to give to individual Architectural Association students permission to visit their buildings. Personally, by previous arrangement, I should be always pleased to do so. There are two other points bearing upon the work of the last session that I feel bound to touch upon. First, that the instructors do not think the "home-work" is as good as it should be, and the second is the want of support given to the modelling class. As regards the former—the Association cannot, of course, attempt to regulate the "home-work" of students, but let me say that if they want to obtain the full benefit of the lectures and classes they pay for—home-work is

AN INVALUABLE ACCESSORY,

and one which by being neglected leaves the individual student the main sufferer. And with reference to the latter, what I have said as regards workshop study applies with equal force to the study of modelling. Wholly independent of the intrinsic value of modelling as a means of learning form and proportion, and the value of light and shade under various conditions, and in various positions, it is one of the greatest helps to an architect being able to illustrate his requirements as to ornament, or intricate stone work, by modelling for the carver or mason—and it is a kind of illustration that both carver and mason appreciate far more than a pencil sketch, and greatly enhances the reputation and respect for an architect amongst the workmen. Somehow the great value of modelling is not properly appreciated. In Mr. Pomeroy we have an instructor second to none in the art, and this, combined with the simple facts that I have stated as regards

THE VALUE OF MODELLING

to the architect, should tend to render this one of the most popular classes in the Architectural Association. I am afraid so far you have found what I have said very severely practical, but I cannot but feel that if we wish to make the Association work more thoroughly successful than it is, it is well that we should at times look at the severely practical side of things, and see where our defects and weaknesses are, that we may be in a better position to remedy them. To turn now to more general subjects. Undoubtedly the greatest need of the Association at present is the want of new premises. For years past this need has been unceasingly felt. The prospect of

NEW AND MORE SUITABLE PREMISES

has so often been foreshadowed, unhappily without any tangible result, that I cannot

wonder that members should feel disappointed, and, consequently, somewhat apathetic on the subject. But I can assure those who are not immediately behind the scenes that the question is by no means an easy one, and beset with many difficulties. The committee, as a body, certainly have not shirked the question. Time after time have different schemes been brought before them, and many hours have been spent in the inspection of possible buildings, and yet on only two occasions have we come anywhere near a solution of our problem—and then only to find our hopes blighted by some unforeseen difficulties. The largeness of our requirements and the limited means at our disposal, form the two great obstacles to the attainment of our long deferred hope. In company with several of my predecessors in the chair, I had good reasons to hope that I should be able to bring before you this evening a scheme that would meet our requirements, and it is with much regret that I find myself at the last moment unable to do so. But I can say this much, that the Jubilee Premises Committee have under consideration another scheme that we sincerely trust we shall be able to submit for your consideration at no distant date. As certain questions have lately been put to me on the subject, I will briefly state what I consider our needs are, and what I shall aim at obtaining in any scheme for new premises. In the first place, I should like to see our Architectural Association centre made much more of

A TRUE CENTRE, A HOME, OR CLUB,

if you like it better, of architectural life; a place where one and all members could drop in at all reasonable hours of the day, and enjoy the privileges of a good common room, where light refreshments could be obtained, and a comfortable reading and writing and smoking room; a place where one would not feel ashamed to ask a friend or client to meet one, and where the parents and guardians of any student might call, without feeling that they were visiting a sort of architectural wholesale warehouse or counting-house; and last, but not least, a place where country members or members of allied societies, could call, and feel that they had a homely centre in this great metropolis, where they would be always welcome and could meet men of like interests to their own. I have no wish to draw any fantastic picture, but in my humble opinion a modified club life, such as I have referred to, would be of great service to the younger as well as the older members of the profession. Within proper limits its tendency would undoubtedly be for good all round; it would form a social background to the otherwise serious educational work of the Association, which would reflect warmth of feeling and create a spirit of *esprit de corps* amongst its members. I could wish that there was some such

CLUB LIFE IN THE ROYAL INSTITUTE OF BRITISH ARCHITECTS,

that it might be in reality what it should be—the proper social, as well as the professional, centre in London for all architects. In addition to good offices and library and classroom accommodation, it is, I think, desirable that we should have our own meeting room if possible, and a large well-lighted and ventilated studio will be an essential feature; and the next important new requirement should be demonstration workshops—an addition which will, I hope, be one of the great features of our future educational work. You will notice that I use the title demonstration workshops; I do so advisedly. Any scheme for extensive workshops in various trades would (even if it were desirable) be entirely beyond our means. Men who wish to attend regular workshops where they can see a large variety of work can always make arrangements with some good builder to do so, and they will no doubt obtain

A GOOD INSIGHT INTO PRACTICAL WORK.

There are, however, many obvious difficulties, and, I think, some objections to regular builders' workshops training. To begin with, anyone who wishes this sort of training to be of real service to him must make up his mind that no half measures will be successful. He must

drop any sort of kid-glove studentship, and be ready to work with his hands, and on the same footing as any ordinary mechanic. There are troublesome class difficulties and craft jealousies to be faced—a footing to be paid for, added to which there are only too often influences of a low moral and degrading kind, that cannot be healthful to the younger student just starting upon his life's career; and in saying this, I speak from personal experience. Again, hard manual work at the bench or banker may often be injurious to a man's sketching and pencil work. It is for these reasons that I think

THE FIRST PRACTICAL TRAINING

for architectural students should be in technical schools and demonstration workshops rather than at the actual bench or banker at a builder's works. If after such training a student can take the position of a clerk of works, or a place under a good clerk of works, I believe he will have precisely the kind of practical training that an architect requires. The demonstration workshops that I should like to see in connection with the Architectural Association ought to consist of at least three large rooms: one for carpentry, a second for mason and bricklayer's and tiler's work, and a third for plumbing and general metal work. The furniture would, of course, consist of benches, bankers, lathes, and other necessary tools and appliances on a modified scale—but, further, it should be furnished with

MODELS OF WOOD, STONE, AND METAL CONSTRUCTION,

and plumber's work. In some cases, such as roofs, floors, staircases, and groining, the models would necessarily be on a small scale, but in all cases they should show accurately the construction, with joints, tenons, mortices, scarfings, etc., complete. But for such details as doors, window sashes, and casements, and other things of every-day use that will readily suggest themselves, full-size models would be more useful, and so made that they could be taken to pieces and put together again, so as to be copied, bit by bit, to small scale by students.

(To be continued.)

A GERMAN amateur, Dr. Selle, has made a noteworthy advance in adapting the processes of colour photography already known so as to make them of practical value. Hitherto the pictures have been expensive, and have taken a long time to produce. Dr. Selle has devised a method of making negatives from exposures taken through three films of complementary colours, which enables him to rapidly reproduce the pictures to any extent in the natural tints. It is asserted that prints by his method can be made at the rate of one a minute, by duplication very similar to that of the collotype process. Certainly the pictures which he has already produced are very beautiful, and surpass the most careful colour printing in the accuracy and delicacy of the hues. The shades of a butterfly's wings, the plumage of a bird, the tints of a piece of Bayeux tapestry, are shown with marvellous fidelity.

SOME uneasiness has been created at Southsea by preparation for the erection—on the edge of the Common, between the Clarence Esplanade Pier and the Castle—of a building which is to serve as an engine and boiler house for the generation of the electricity for the search lights at the entrance to Portsmouth harbour and along Southsea beach. The building will be, it is stated, about 24ft. long by about 15ft. wide, and 15ft. in height. Concrete bases are being laid for two sets of engines and two dynamos. It is feared that the building, &c., will be a serious eyesore from the residences and hotels on the other side of Southsea Common; and though it is not disputed that for defensive purposes the War Department have full power to avail themselves of the Common, it is felt by the townspeople that within the walls of the Castle and elsewhere there is ample accommodation for such a building, and that by the erection of such a structure on this part of the Common little consideration has been shown to the authorities and inhabitants of the watering place.

AN ENORMOUS . . . AGGREGATION OF .

Architectural Articles.

Important Announcement

- - in regard to - -

"THE BUILDERS' JOURNAL."

"The Builders' Journal and Architectural Record" is admittedly the best and brightest weekly paper published for the Architectural Profession and the Building and Allied Trades.

Upon repeated occasions the bulk of the

"Journal" has been increased.

It is now the intention of the Editor to enhance the authority, artistic quality, and literary and technical excellence of the "Journal."

The pages of "The Architectural Review"

cannot adequately cope with the num-

ber of authoritative and excellent

articles offered from time to time,

and the Editor of "The Builders'

Journal" has now arranged to take

a selection from such articles for

insertion in the "Journal." Thus,

while "The Architectural Review"

will deal with Art subjects of endur-

ing character and undoubted influ-

ence, "The Builders' Journal" will

publish the more controversial and

currently critical subjects offered for

consideration.

The only Architectural Magazine

Now Published.

Now . . . The . . . Ready.

OCTOBER NUMBER

. of the .

Architectural Review

IS UNIQUE IN INTEREST.

So strong a Series of Articles and

*Illustrations for the
ARCHITECT and CRAFTSMAN
has never previously been brought
between the covers of a Magazine.*

One of the timely features

*of the October Number
is the Second Supplement of
"THE COLLECTOR" Series
containing a special article on the*

Rembrandts at Amsterdam

Written by Harold Rathbone.

A fine Reproduction of

*Rembrandt's famous Painting
"THE NIGHT WATCH"
adorns this Number.*

Bridgnorth from the River:

An Autograph Lithograph

*by Oliver Hall, R.E.,
is also presented.*

The Work of John Belcher:

*Superbly illustrated:
Written by C. G. Harper.*

STRAND, W.C.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

October 12th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slates; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE two Roman pavements recently discovered at Leicester, close to the old church of St. Nicholas, were discovered during the digging out of cellars for some new shops to be built. Their present level is from 8ft. to 12ft. below the street. The surface of the larger piece is much damaged, and the border is lost on two sides. The colouring is very rich, and the design handsome. It consists of nine octagons with a rope ornament. The central design is a peacock, with a beautiful circular border.

THE smaller pavement lies at a distance of 4ft. The margin is defective, but otherwise it is in almost perfect condition. It is plainer than the large piece, and is in two parts. Over two-thirds of its surface there is a simple diagonal pattern, alternating in white upon a grey ground, enclosed in a white rectangular border with a broader strip of grey outside. The other third is of plain grey stone, with red ends, the grey ground being dotted over with clusters of five white tesserae in the form of a cross. Leicester occupies the site of the Roman Ratae, an important station on the Fosse Way.

A LETTER from Friedrichsruh informs us that the building of the mausoleum for Prince Bismarck is being pushed forward with considerable speed, and that great numbers of workmen are now busy upon it. Its huge dimensions are already perceptible; the height of the dome will be not less than twenty-six to twenty-seven metres, and the stone walls are about 1½ metres thick. A chapel, with an altar and decorations, will occupy the centre of the mausoleum. Beneath this will be a huge crypt, with nave and aisles. The bodies of Prince and Princess Bismarck are to be laid side by side at the western end of the nave of the crypt. It is hoped that the building will be so far advanced before the end of autumn as to permit the ceremonial "translation" of the coffins of the great statesman and his wife to their final resting-place.

It is well-known that "megalithic monuments," that is to say, erections of big stones such as our "dolmens" and "cromlechs," are scattered over a great part of Europe from Scandinavia southwards, the north of Africa, and elsewhere. There are very good examples at Ellez, in Tunisia, between Kef and Kairouan. They are built of limestone slabs, and many of them are divided into chambers which have evidently been inhabited. The fact that no regular vents for air or smoke have been observed in them led M. Gauckler,

Director of Antiquities and Fine Arts in the Regency of Tunis, to regard them as tombs. Others look upon them as the remains of an ancient necropolis, which came to be inhabited later on. As to the date of the structures opinions vary, some placing it after the invasion of the Vandals in the fourth century of our era, others referring it to a prehistoric period. Probably the last view is the more correct. At any rate the European dolmens are prehistoric.

THE destroying hand of the builder is being laid heavily on Dulwich village. Thanks to the determination of the trustees of Dulwich College not to grant a fresh lease to anyone proposing to carry on the business of a licensed victualler, the picturesque "Greyhound" has been razed to the ground. The hotel which has been demolished had stood for upwards of two centuries. In its rooms wits like Dickens, Thackeray, Mark Lemon, and others, often whiled away pleasant hours; and Sir Joseph Paxton frequently stayed there during the building of the Crystal Palace. The records of the house, however, go much further back. Camberwell's parochial archives, too, bear witness to the fact that in the days when the village magnates were wont to settle parish affairs in favoured inns the "Greyhound" had its turn, for in 1768 they met there to settle the poor rate.

MUCH credit is due to the promoters of the Photographic Salon—a small band of enthusiasts who, six years ago, made a notable endeavour to lift the art of sun picturing to a higher place than that of a mere copyist. They sought to prove that in educated hands the camera was something more than a recorder of bare facts, and that by its aid a picture could be produced possessing those qualities which are called artistic. Annual exhibitions of photographs had, it is true, been held in London and occasionally in the provinces, ever since Daguerre in France and Fox Talbot in England had found out how to entrap the fugitive images formed by means of a lens, but the pictures shown were, with few exceptions, much of the same type, mere transcripts of nature, while at the same time they were unnatural, and full of blemishes which made their acceptance as works of Art impossible. The members of the Salon determined to do their best in the way of reform, and as they deemed it hopeless to influence to any great extent exhibitions which had kept to the old ruts for so long, they took the bold step of starting an exhibition of their own on altogether novel lines. That their efforts have been successful is evident from the circumstance that the present exhibition, held, as heretofore, at the Dudley Gallery, is the sixth.

MANY of the prints are produced by a comparatively new process, in which actual brush work is considered not only permissible but necessary, a process which is hardly recognised by the professional photographer who has not the time to devote to the necessary manipulations. Briefly this process, known as gum-bichromate, consists in coating a sheet of paper with fine carbon, or any suitable pigment, which has been tempered with gum water and bichromate of potash. This salt renders such pigment insoluble. After exposure to light; and when paper so prepared is placed under a negative through which the light is allowed to act, the highest lights only remain soluble, while the various gradations of the negative cause a gradual increasing insolubility to be attained until the deepest shadows are reached. This print, after exposure to light, is left to soak in water so as to remove the soluble portions, and a brush can be used to modify the attachment of the pigment to the paper to any extent desired. It would seem, however, that there are many difficulties in bringing this process to anything like perfection, at least so we judge by several pictures hung here, which have the appearance of studies in charcoal or black chalk rather than photographs; while, on the other hand, some seem to know how to so work the process that they can produce by it pictures of the

utmost delicacy. This is notably the case in the works of Robert Demarchy, who has taken the lead in this new kind of photography, as will be seen especially in his decorative panel No. 11, which is full of charm.

EDOUARD DETAILLE, the famous French battle painter, is the subject of an interesting article in the *Century Magazine*. This great artist was born some fifty years ago in Paris. His early youth was passed entirely in a military atmosphere. He was a constant visitor for many years to the studio of Horace Vernet, where the most illustrious survivors of the Grand Army were wont to meet. At an early age he became a pupil of Meissonnier, and in 1867 exhibited his first picture at the Salon. One year later he appeared again at the Salon with a larger work, entitled, "Halt of the Drum Corps," with which he scored a great success. To-day his studio on the Boulevard Malesherbes is a military museum.

NEVER was soul of artist more completely reflected in his work than is Detaille's. His soul expands into solemn grandeur in his series of paintings of the French army. It appears emotional in "The Dream" (*Le Reve*), in "The Victims of Duty," in "The Sally of the Garrison of Huningen," and in the "Retour de Chalons." It reveals itself in all its jovial kindness, its clever and gentle irony, in the humorous sketches which may be placed in sequence with those of his famous predecessors, the Vernets, Raffet, Charlet, without fear that the comparison will be to his disadvantage.

For some time past most of the popular Art shows have reduced the number of their pictures, and there has been a general tendency towards exhibitions of moderate dimensions, it being generally allowed that such a course is not only more agreeable to the public, but it raises the character of the collection, and is of greater benefit to the artist. It is satisfactory to find that the directors of the New Gallery are conforming to this excellent custom, and it is to be hoped in due time the Royal Academy may see its way to a similar reform. If we mistake not, this is one of the smallest autumn exhibitions ever held in this gallery—there being but sixty-two pictures hung in the two principal rooms. These are the work of forty-seven artists of the modern French school. The South Room contains a collection of objects of Art exhibited by Signor Bordini, of Florence, and in various cases may be found enamels designed and executed by M. Eugène Feuillâtre, M. René Foy, and others.

AMONG the pictures above alluded to especial attention may be called to Madame Virginie Demont Breton's vigorous and lifelike presentation of a young girl bathing "In the Azure Sea," and M. Adrien Demont's fine study of sea, sky, and shore in "Wreckage." Two fine bits of portraiture and wondrous contrasts between the costume of the past and the present may be found in M. J. P. Laurens' portrait of his son and "A Bravo," by M. F. Roybet. "Grandpapa's Visit," by M. J. A. Muenier, recalls the work of some of our early Pre-Raphaelites, and M. R. Collin's "Awakening" is a graceful nude on a large scale. M. J. Machard's "Sleep of Eros" is poetically rendered, but loses considerably from the pallor and coldness of its flesh tones. M. Benjamin-Constant's portraits should all be attentively considered. Among them may be especially named those of M. Hanotiaux, M. Saint-Saëns, and the aunt of the artist. M. A. Muraton's "Marquis de V." is vigorous and lifelike, and another portrait by M. E. Bordes is full of power. "Cast up by the Sea," by M. F. Tattergrain, "Moonshine on the Canal of St. Denis," by M. R. Billotte, and "In the Park of St. Ange," by M. E. G. Marché, are among other landscapes which should by no means escape careful inspection. Lovers of the mystical will find ample food for reflection in "Diana," by M. J. L. Gérôme, "An Angelic Choir," by M. E. Maxence, and "A Fantasy," by M. G. G. Roger. There are some interesting cases of ancient musical instruments, marriage caskets, and majolica in the central hall, and a

fine collection of photographs from notable pictures is on view in the balcony.

THE advance of years does not seem to have diminished in any way the artistic energy of Mr. G. F. Watts. Few modern artists can show a more wonderful record of work accomplished year by year, or more convincing evidence of most valuable mental activity. The veteran painter is constantly busy with new schemes for the popularisation of the highest type of Art, and is ever devising fresh ways of appealing to the latent æstheticism of the masses. His latest idea, says the *Globe*, the outcome of a suggestion made by him eleven years ago, is to provide a series of permanent memorials of heroism in every-day life. His argument is that the great deeds of individuals constitute one of the chief "abiding possessions" of the nation to which these individuals belong, and that courage and devotion in the ordinary circumstances of private life claim as much recognition as magnificent achievements in battle or in the public service.

To provide a first step towards the realisation of this scheme, Mr. Watts has undertaken, with the hearty sympathy of the vicar of the parish, to build in the churchyard of St. Botolph's, Aldersgate, an open gallery in which can be placed memorials of the type that he considers appropriate. The first one he will contribute himself, taking as his motive the devotion of a young nursemaid, Alice Ayres, who, at a fire in Gravel Lane, in 1885, sacrificed her own life to save those of three children who were in her charge; and he hopes as time goes on to make other additions to the series. The material suggested for these illustrations of everyday heroism is terra-cotta, which will, it is thought, have the advantage of being convenient to handle and reasonably permanent.

MR. WATTS, meanwhile, is busy making additions to his great collection of contemporary portraits which will eventually become one of the most important of the national possessions. He has just completed a portrait of Mr. Gerald Balfour, adding him to the already long roll of notable men whom he has numbered among his sitters. The final touches to the great statue of "Physical Energy" are also occupying the artist's time. This colossal equestrian figure forms part of his gift to the nation, and a site for it is to be provided ultimately in some central position. It will serve admirably as a memorial of a great worker whose whole life has been a record of devotion to the best interests of our native Art.

AFTER lying neglected and almost forgotten in a house at Maidenhead for over twenty years, a remarkable collection of intaglios have come to light. The collection embraces nearly 2000 "impressions" of cameo work of the most delicate description, the material on which the impressions have been made being red sealing-wax. Additional interest is lent to the collection by the fact that it formerly belonged to a Lord Mayor, Mr. Alderman Boydell, who filled the civic chair in the year 1790. There appears to be no doubt that the Alderman was an enthusiastic as well as a careful collector, and the fact that he must have spent enormous sums of money upon his hobby is evidenced by the quality and the number of the specimens which he secured during his lifetime. It is known that he succeeded to an old-established print-seller's business in Cheapside, and was at one period of his career a man of considerable wealth. His collection of pictures when sold by auction fetched a very large sum of money. His enterprise in the advancement of British art ended, unhappily, in bankruptcy. The present collection is, of course, one of impressions from original stones, and if those stones could be gathered together, as the replicas have been, they would be worth many thousands of pounds. Great care was taken in forming this collection, which is contained in nearly twenty fairly-sized cases, made of English oak and strongly fastened. Each specimen is numbered, a fact which proves that they were at one time carefully cata-

logued. Not one of the specimens is duplicated; at least, that is the opinion which has been formed by those capable of judging. Many are very minute, and their artistic beauty can only be fully appreciated by means of a powerful glass. Some are obviously comparatively modern in character, and this may be judged by the lack of that delicate expression and exquisite workmanship which is the charm of the old—and lost—art.

THE much-felt requirement for thoroughly independent tests with fire-resisting materials and systems is now to be met by a testing station, organised under the auspices of the British Fire Prevention Committee, where, in lieu of the often one-sided exhibitions given by makers and inventors, the investigations will be carried out reliably in an essentially practical manner and on scientific lines. The committee's testing station will be near Regent's Park, within easy reach of the West End, and the necessary arrangements are already being made to inaugurate the first series of tests. Systematic research work in the question of fire resistance has, as yet, only been commenced in the States, and the testing station in question will be the first of its kind in Europe. The preliminary arrangements have been in the hands of Mr. Edwin O. Sachs, acting for the Executive, and Mr. Fredrick R. Farrow, acting for the commercial section. The tests in each case will be undertaken by the Executive, in conjunction with representatives of the Council and the general body of members, and the reports will take the form of statements of facts, supplemented by diagrams and photographs duly attested. The first set of tests will be with ceilings, and among the firms on the register in order of application whose work is being investigated, we see that the Asbestos and Asbestic Company and the Expanded Metal Company hold the first place.

THE works in connection with the conversion of Hertford House, Manchester Square, into one of the national museums for the housing of the collection which Lady Wallace bequeathed to the nation, are being rapidly carried out by the Office of Works, under the direction of Sir John Taylor. Galleries are being erected over the north wing of the house, where in former times the stables stood, and new staircases have been constructed for both the west and the east wings, while the front staircase will remain as it was in the days when the Prince Regent ascended it so often. The walls of the smaller rooms are being pierced with archways, so that they will form a succession of galleries, while provision is being made to light the picture galleries from the roof, and the entire building with the electric light. The celebrated ball-room in which Becky Sharpe displayed her histrionic ability in the charades has had a gallery placed around it, and the two lodges at the gates, outside which Rawdon Crawley was "nabbed," are to be swept away to make room for a better approach to the new entrance and vestibule, which is being built in front of the house. Hertford House was built in 1771 by the Duke of Manchester, and before becoming the property of the Marquess of Hertford it was successively the habitation of the Spanish and French Embassies, Talleyrand living in it during this period. The collection of armour, pictures, and curiosities has not been removed during the alterations, but has been carefully stored in the completed parts of the building.

It would scarcely be possible to praise too highly the plate which Messrs. Leggatt have just published after Romney's exquisite portrait of Mrs. Townley Ward, which was lately lent by Lord Aldenham to one of the Guildhall Loan Exhibitions. It was executed in pure mezzotint by Mr. Scott Bridgwater, who has been exceptionally successful in retaining the characteristic charm of the picture. He has interpreted delightfully the distinctive beauty of style and elegance of drawing of the original, and has gained notable richness of tone throughout without losing delicacy in his gradations or variety in his surface. The reproduction does full justice to the genius of the artist.

L.C.C.

THE BUILDING COMMITTEE'S REPORT.

THE sittings of the London County Council were resumed on Tuesday of last week at the County Hall, Spring Gardens, Mr. T. McKinnon Wood presiding.

COMPLETED LOANS.

The Finance Committee reported that the following loans had been completed: Bermondsey Vestry, £4000 for paving works; Hackney Vestry, £2190 for additional expenditure on town-hall; Hammersmith Vestry, £15,500 for electric lighting; Hampstead Vestry, £16,700 for electric lighting; Hampstead Vestry, £39,980 for electric light installation; Islington Vestry, £23,840 for electric light installation; Kensington Vestry, £15,500 for addition to offices and coroner's court; Lambeth Vestry, £5,985 for paving works; Newington Vestry, £5000 for various works at depot; Poplar District Board, £9200 for paving works; St. Pancras Vestry, £4590 for sanitary conveniences, and £17,000 for baths, &c.; St. Pancras Vestry, £16,560 for street improvement and paving works; Shoreditch Vestry, £11,340 for electric lighting; Wandsworth District Board, £1800 for sanitary conveniences; Camberwell Guardians, £11,000 for purchase of land; Islington Guardians, £50,000 for erection of infirmary; St. Marylebone Guardians, £58,340 for erection of workhouse; Shoreditch Guardians, £3140 for school and infirmary; Whitechapel Guardians, £7500 for alterations to workhouse; and Battersea Overseers, £4840 for additions to town hall, &c.

PROPOSED LOANS FOR LOCAL WORKS.

Upon the recommendation of the Finance Committee, it was agreed to lend the Battersea Vestry £1545 for the erection of conveniences; the Islington Vestry £21,010 for street improvements, laying out open space by Cattle Market, &c.; St. George's East Vestry £3000 for paving works; the Westminster Vestry £15,000 for similar purposes; the Strand Board of Guardians £7035 for the erection of receiving wards at the workhouse; the Wandsworth Guardians £11,400 for the erection of a nurses' home; and the Managers of the Central London Sick Asylum District £32,000 towards the cost of building an asylum at Hendon.

A QUARTER'S EXPENDITURE IN TECHNICAL INSTRUCTION.

The regulations made by the Council on May 29th, 1894, governing the financial relations between the Council and the Technical Education Board, provide that the Board shall furnish quarterly to the Finance Committee a detailed statement of receipts and expenditure, and that it shall be the duty of the Finance Committee to report to the Council upon the expenditure of the Board in relation to the estimate. The statement of account submitted by the Technical Education Board for the quarter ended June 30th, 1898, had been examined by the Comptroller, the Finance Committee reported. The expenditure for the quarter amounted to £25,918 18s. 3d., and under one head had exceeded the estimate, viz., under the head of art teaching, science and technology, and the manual instruction for the year 1895-6. The excess, however, was not large, being £71 2s. 7d. on an estimate of over £17,000, and it was stated that the expenditure under that head for the year in question was practically completed. The balance in the hands of the Board on June 30th was £90,800 3s. 5d., including the £75,000 paid over to the Board's account under the resolution of the Council of June 21st.

THE EAST LONDON WATER SUPPLY.

The Chairman gave urgency, after the Council had sat for two hours, to the following motion placed on the paper by Mr. W. Crookes, one of the Labour members for Poplar:—"That, in view of the existing difficulty in obtaining an adequate supply of water in a large portion

of the County of London, it be an instruction to the Water Committee to forthwith submit its proposals with regard to legislation affecting the water supply in the ensuing session of Parliament." In proposing this motion, he said the Council needed no apology after recent events for the introduction of this important question. They had been told time after time that the companies were quite capable of attending to their own businesses if left alone, and that they were able to give the people an adequate supply. In his opinion, had it not been for the efforts of the sanitary authorities there would have been a very serious epidemic in the East End of London. They had been told that all would have been right if cisterns had been provided, but the Council were advised that such cisterns were hotbeds of disease, and there was therefore the alternative of a constant supply. As to the statement that the water was pure, he could only say that after it had stood for a time there was a film upon it. The fact was, the people of the East End had no means of storing the water, and when he told them that in one block of ten houses there was one tap for the eighty-six persons who lived in those houses, they could readily understand what a short supply meant for those people. Whatever happened, he hoped the Council would look at the water question from a view quite apart from the companies' present supplies, since nine-tenths of that supplied by the East London Company came from the Valley of the Lee. What the Council ought to do was to go straight away to Wales, and not waste time and money in attempting to patch up the present system.—Mr. J. Stuart, M.P., in seconding the resolution, expressed the view that the water famine was due to the culpable negligence and carelessness of the East London Company. It was only last year that the Company obtained Parliamentary powers to connect their mains with those of other companies in case of urgency, and yet it had taken all the summer for the company to realise that that opportunity was in their grasp. He denied that the County Council were responsible for the famine owing to their opposition to the Bill of 1893, and said that the facts were against those who sought to prove that. The Company's representative told the Select Committee, when the Bill was before the House, that they could depend upon a supply of 36,000,000 gallons a day, but that assumption had been proved to be fallacious. They also told the Committee that they had a storage capacity of 910,000,000 gallons. It was eventually found that the Company's storage did not exceed 615,000,000 gallons. That showed the very loose way in which the company made its statements before the Committee.—Mr. Beachcroft moved an amendment to add the following words to the motion, "and also obtain the opinion of the engineer as to what works are required to provide connection with the mains and works of the several companies for use in case of emergency." He thought his proposal was a practical one, and would not affect the main question of future supply.—Mr. H. Percy Harris seconded.—Sir Arthur Arnold said that no greater condemnation of the companies could be made than that which was contained in the amendment, which actually suggested that the engineers of the companies had not taken every step possible to meet the wants of London.—On the motion of Mr. Dickinson, the debate was adjourned.

THE GREENWICH TUNNEL.

The Bridges Committee thought it advisable that the Council should invite tenders for the construction of the tunnel, and recommended accordingly.—This was agreed to.

MESSRS. RAPHAEL TUCK'S PLANS REFUSED.

The Building Act Committee submitted the following recommendation, which was agreed to: "That the consent of the Council be not given to the erection on the west side of Moorfields, between Tenter Street and White Street, of a building to exceed in extent 250,000 cubic feet, and to be used only for the purposes of the trade of a fine art and book publisher, as shown by the plans and particulars submitted with the application of Messrs. Raphael Tuck

and Sons, Limited; as it has not been shown to the satisfaction of the superintending architect that the additional cubical extent is necessary for the purposes of the trade or manufacture to be carried on at the premises, and that proper arrangements have been or would be made and maintained for lessening, as far as reasonably practicable, danger from fire.

LLOYD'S AVENUE—A NEW CITY STREET.

The Building Act Committee also submitted the following recommendation, which was agreed to:—"That the consent of the Council be given to the erection of a building on the south side of Fenchurch Street, flanking on a proposed new street, named Lloyd's Avenue, between Fenchurch Street and Crutched Friars, with the flank exceeding in height the width of Lloyd's Avenue, as shown upon the plans, dated July 23rd, 1898, submitted with the further application of Mr. T. E. Colclutt on behalf of Lloyd's Register of British and Foreign Shipping, such consent being subject, however, to the following conditions—that the building be commenced within eighteen months from August 30th, 1898.

ALTERATIONS AT THE CITY OF LONDON BREWERY.

The Building Act Committee recommended: "That the consent of the Council be given to the erection of a two-story angle-turret to 89, Upper Thames Street, at the corner of All-hallows Lane, to the line shown on the plans submitted with the application of Mr. A. J. Gale on behalf of the City of London Brewery Company Limited, such consent being subject, however, to the following conditions—that the angle-turret be commenced within six months and completed within eighteen months from October 4th, 1898; that within three months after the erection of the angle-turret the whole of the land coloured blue on the deposited block plan be dedicated to and left open to the use of the public."—This was agreed to.

THE KING'S ARMS, LOWER THAMES STREET.

The Committee further recommended "That the consent of the Council be not given to the erection of a four-story oriel window at the King's Arms public-house, Lower Thames Street, at the corner of Water Lane, as shown upon the plan submitted with the application of Mr. H. M. Wakley on behalf of Reid's Brewery Company Limited, as having regard to the fact that Lower Thames Street and Water Lane are both less than 40ft. wide, it is considered undesirable to permit the erection of the proposed oriel." With reference to the general plans for the rebuilding of this house, the committee also recommended:—"That the sanction of the Council be not given to certain deviations from the plans certified by the district surveyor, under Section 43 of the London Building Act, 1894, so far as it relates to the proposed rebuilding of the King's Arms public-house, Water Lane, as shown upon the plans submitted with the application of Mr. H. M. Wakley on behalf of Reid's Brewery Company Limited, as having regard to the narrowness of Water Lane and Lower Thames Street at this part, it is deemed inexpedient to permit the erection of the new building to the height proposed."—This was agreed to.

THE CUSTODY OF THE EMBANKMENT.

The Council discussed at some length the adjourned report of the Local Government and Taxation Committee's report relative to the proposed transfer of powers from the Council to the local authorities. The first matter which in any way at all affected the City was the following recommendation of the committee: "That the maintenance of the Victoria Embankment and portions of streets adjoining in the precincts of the Savoy and the footways of the Albert and Chelsea Embankments be transferred to the local authorities, and that the lighting, watering, and cleansing of the Victoria Embankment and the footways of the Albert and Chelsea Embankments be transferred to the local authorities, subject to the maintenance and lighting of the walls of the Embankments being retained by the Council."—The recommendation of the Committee was agreed to.

Professional Items.

ABERDEEN.—The opening ceremony of the new Donegall Road Presbyterian Church, Aberdeen, was performed recently. The new church is designed in the Tudor style, carried out in red perforated walling, with red sandstone dressings, window sills, and copings. The ground plan is almost a square of 80ft., divided into nave and aisles by cast metal columns, which rise up to support the galleries and roof principals. A doorway of large size, with clustered columns at jambs and moulded arches, form the centre portion of the main front. The angles of the façade are occupied by projections containing the gallery staircases. One of these is designed to be carried up as a square tower of massive proportions, terminating in lofty pinnacles. The other projection is covered with a steep octagon slated roof. The gable finishes in a brick pinnacle, surmounted by a copper vane. Boldly projecting buttresses are planted at intervals along the side walls, with lofty double light mullioned windows between them. The shallow transepts have three-light windows. Access is obtained through a spacious vestibule to the body of the church, in which the pews converge to one centre point filled by a handsome platform, executed in pitch pine and walnut. The contractor is Mr. Robert Corry, and the architects Messrs. Young and Mackenzie.

BRISTOL.—New offices are being erected in Telephone Avenue, Baldwin Street, Bristol, for the directors of the National Telephone Co. The frontage of the new building will extend for a distance of about 104ft. towards Telephone Avenue, which is to be the name of the street connecting Baldwin Street and Marsh Street, and it is to be faced with Cattybrook bricks, with Hartham Park stone dressings. On the ground floor are a spacious entrance hall, with offices for the local manager and staff, and public call rooms. The switch room occupies the whole of the rear portion of the building. On the same floor are girls' dining rooms, kitchen, cloak rooms, and lavatories. The first and second floors are devoted to spacious and well lighted offices for the district manager and staff, and for the various departments. On the lower ground floor are the test rooms, instrument room, general stores, strong room, lavatories, workmen's rooms, &c. The contract for the building was secured in competition by Messrs. W. Cowlin and Sons, and the work is being carried out from the designs, and under the superintendence, of Mr. Edward Gabriel (Edmeston and Gabriel), of Bristol and London.

CARDIFF.—The Royal Hotel, Cardiff, has recently undergone considerable structural alterations. The principal features in the re-arrangement is the doing away with what is known as the "Cathedral" bar, and throwing the space into the reception hall, whence a grand staircase is to be carried up to the first floor, the existing stairs being dispensed with. The kitchens, which are now located in the basement facing St. Mary Street, are to be converted into a series of billiard rooms, the kitchens being arranged on the top floor of the building, where also extensive laundries are to be constructed. The plans of the alterations were prepared by Messrs. J. P. Jones, Richards, and Budgen.

CLONFERT.—A two-light stained glass window for the east end of Clonfert Cathedral has recently been erected by Messrs. Hardman, of Birmingham. The stained glass windows for the south side of the chancel are being made by Messrs. Watson, of Youghal. It was this firm which supplied the Oliver Goldsmith window for a church in Co. Longford. The work of repair and restoration of the chancel is now almost complete.

DONAGHADEE.—The ceremony of laying the foundation-stone of a new Masonic hall in Donaghadee has been performed. The build-

ing will be of selected red brick, with Griffnock stone dressings to windows, buttresses, and barges. The style of the building is Gothic, of the decorative or fourteenth century period. The barge is of stone, and the ornamental kneelers and apex stone, with carved finial, will pleasingly break up the severity of the skyline. Underneath the barge in the gable Masonic emblems will be carved in a decorated shield. The side walls of the structure will be strengthened by deep buttresses, with stone weathers and string courses, which, in conjunction with the recessed window, will give an artistic display of light and shade to the building. The builder is Mr. Wm. Curragh, who is carrying out the work from the plans and under the superintendence of Messrs. J. J. Phillips and Son, architects.

GLASGOW.—The High School building construction students on Saturday had their first sessional visit to the Dalmarnock Sewage Works. Over 50 of the 102 students belonging to the class attended. Considerable improvements have been effected on the system of purification, and the result is economy and efficiency, the water ultimately being sent into the Clyde a comparatively clear effluent.

LIVERPOOL.—The Sutton National Schools, St. Helens, Liverpool, have been enlarged at a cost of about £3400. The work of enlargement was carried out by Mr. Thos. Woods, builder and contractor, St. Helens, from plans prepared by Mr. B. F. Biram, architect, St. Helens.

MACCLESFIELD.—The West Park Museum, Macclesfield, which was opened last week, stands on the left of the entrance gates in Prestbury Road, and is from the designs of Mr. Pardon Clarke, director of the South Kensington Museum. There is one gallery, with a vestibule, in addition to the curator's room, cellars, and storage accommodation. The walls are built of Ruabon pressed bricks, with mouldings, cornice, and ornamental panels of Ruabon terra-cotta. There is also a medallion of the Queen over the main entrance. The roof consists of Westmorland green slates, upon boards and felt, and on the side nearest to the park is an ornamental iron verandah, under which are placed seats for the public. The interior of the museum is already well supplied with a collection of works of art, geological specimens, and Egyptian and other curios. A feature of the interior is a beautiful frieze, above the wall hoarding, composed of plaster casts of the Elgin Marbles. The building itself has cost about £4000.

SWANSEA.—The old parish church at Swansea has been rebuilt. The nave of the old edifice only dated back to about 1739, and though the chancel and tower were probably about fourteenth or fifteenth century work, they possessed no features of sufficient value to hinder the much-needed rebuilding of the entire church. The old building was also too small, and in many parts unsafe. The new church, in the Early English style, was commenced in December, 1895. The nave was opened in August, 1897, and, with the chancel, is to be consecrated on the 20th inst. The tower, which is up about 35ft., is to be finished next spring. The building is spacious, exceedingly well-proportioned and stately. The nave which has been lengthened at the west end by 26ft., is 60ft. in height to the ridge, and 5ft. higher than the old tower. The chancel has been widened about 7ft., is only 4ft. less in height than the nave, and is joined to the nave by an arch 40ft. high, whereas the old chancel arch was less than 20ft. high. The new tower will be 85ft. high, an increase of 30ft. upon the old tower. The accommodation will be increased by about 300 sittings, all on the ground floor. The Herbert chapel will now be opened by two fine arches, on the west and south, to the nave, and the handsome old tombs will be opened to view. The total cost will be £26,000. Sir A. Blomfield is the architect.

WOLVERHAMPTON.—The completion of Lichfield Street, Wolverhampton, will bring to a

close a very important improvement, which was commenced about twenty years ago, under powers conferred upon the Corporation by the Wolverhampton Improvement Act of 1877. The street was planned, and with the exception of one plot, the land was slowly filled with buildings. The remaining piece is now to be occupied by a handsome block of commercial buildings to be erected for a Birmingham company, known as the Midland Estates Company Limited. The new buildings will consist of three distinct blocks, comprising in all nine shops, with professional and other offices and showrooms above. The upper stories will be approached by three separate entrances, and the internal walls are to be so constructed as to be easily removable to suit the requirements of tenants. Advantage has been taken of the slope of the land, which admits of an accommodation cartway being formed at the level of the basement floor, to plan the construction of a lower story for the provision of showrooms and warehouses under the shops, which can be let independently if necessary. The shop fronts in Lichfield Street will be continued down to that lower story with narrow areas protected by ornamental iron railings. The design, which is of a somewhat ornate character, is in a free Renaissance style of Architecture, and the buildings will be of red brick, with buff terra-cotta dressings, the principal features being the introduction of two-story terra-cotta bay windows with ornamental gables. Messrs. Essex, Nicol, and Goodman are the architects. The contract has been let to Messrs. Henry Wilcock and Co., of Wolverhampton, and the total cost is estimated at upwards of £11,000.

Views and Reviews.

A HANDBOOK OF LAND DRAINAGE.*

This very useful work has just attained the well-deserved dignity of a second edition. It would, no doubt, surprise many people to learn that the subject of land drainage is as scientific and important as the systems of sewerage which are so constantly before us. The book gives particulars of main and tributary drains, intercepting and relieving drains, outfalls, the character of soils, &c., and all information from the manufacture of the pipes to the methods of gauging streams, from the rainfall statistics to a bibliography of the subject. We can confidently recommend a study of Mr. Mitchell's book to all in search of the most authoritative work on land drainage, and architects who wish to have good sites and dry houses should also number it among the technical works upon their shelves. The information on legal matters bearing on the subject is not the least valuable of its features.

* "A Handbook of Land Drainage." By G. S. Mitchell, F.S.I. Second Edition, 5s. "The Land Agents' Record," Limited, 149, Strand, W.C.

LINCOLN CATHEDRAL.*

Lincoln is the latest cathedral dealt with in the series of monographs now being edited by Messrs. Gleeson White and Edward Strange, and published by Messrs. George Bell and Sons. This volume has been compiled by Mr. A. F. Kendrick, B.A. We have already expressed a favourable opinion of the manner in which this series is being brought out, and there is little left to be said but that this volume is a worthy successor to those on Peterborough or Norwich, and maintains the high standard which the editors have set before themselves. The peculiar beauty and interest of the subject-matter no doubt lends an especial attraction to this particular book, and in the selection of the photographic illustrations this beauty seems appreciated and well displayed. If one must be critical, fault might be found with the few black-and-white sketches, which are not first-rate; and would it not be possible in the general plan at the end to show the different dates of the work, as it is often shown on similar plans in the professional journals?

* Bell's "Cathedral Series," edited by Gleeson White and Edward Strange: Lincoln, by A. F. Kendrick, B.A. London: George Bell and Sons.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ALDERSHOT.—For the erection of two shops, &c., Station-road, for Mr. R. S. Blades. Messrs. Friend and Lloyd, architects, Aldershot:—
Martin, Wells and Co. £2,700 W. Garland ... £2,497
W. J. Snuggs ... 2,639

AMBLE.—For levelling, paving, &c., Albert and other streets, for the Urban District Council. Mr. W. Gibson, surveyor, 51, Queen-street, Amble:—
J. Scott ... £213 0 R. & G. Brown, Amble* £225 8
A. Douglas ... 253 10 E. Coulson ... 219 0
Surveyor's provisional estimate, including 3 per cent. for plans, &c., £232
* Accepted.

BARNET.—For erecting a villa residence. Mr. F. Denzil Thomas, architect, Woodside Park, North Finchley:—
Brown & Sweetland £2,327 0 Daniels ... £2,240 0
Poller ... 2,270 0 Smith and Son ... 1,897 10

BEVERLEY.—For the erection of Registrar's Offices and extension of the County Council Offices, Beverley, for the East Riding County Council. Mr. B. S. Jacobs, architect and surveyor, Lincoln's Inn-buildings, Bowdley-lane, Hull:—
T. Hodgson ... £1,829 3 3 J. R. Foley ... £1,163 0 0
J. Constable ... 4,543 14 9 R. Potts, Beverley* £1,161 1 7
G. Pans ... 4,239 17 10 * Accepted.

BROMLEY (Kent).—For the erection of stabling, &c., at "Lomond," South Hill, Bromley, Kent, for Mr. J. A. Shepherd. Mr. W. A. Williams, architect, 84, Chancery-lane, W.C.:—
Grady ... £130 Duthoit* ... £397
Somersetford ... 414 * Accepted.

DOVER.—For the erection of stables and coachman's cottage at River, near Dover, for Mr. J. L. Rubel, M.D. Mr. A. H. Steele, architect, Dover:—
Smith ... £223 Dixon* ... £372
Golder ... 385 * Accepted.

DOVER.—Accepted for the erection of a cottage at Martin Mill, near Dover, for Mr. O. C. Shawe. Mr. A. H. Steele, architect, Dover:—
Dixon, Dover ... £280

DOWNPATRICK.—For the erection of water supply works, reservoir, &c., Tannaghmore, for the Union Guardians:—
D. J. Jardine, Belfast ... £826 6 4

DURHAM.—For the execution of private street works, Neville's Cross, for the Rural District Council. Mr. G. Gregson, surveyor, "Eastwood," Western Hill, Durham. Quantities by the surveyor:—

Section 1.	
G. T. Manners ... £651 15 11	J. Carrick* ... £638 9 0
J. G. Bradley ... 666 0 0	
Section 2.	
G. T. Manners ... £156 12 7	J. Carrick* ... £154 11 3
J. G. Bradley ... 155 0 0	
Section 3.	
G. T. Manners ... £886 10 8	J. G. Bradley* ... £917 0 0
J. Carrick ... 871 9 11	
Section 4.	
G. T. Manners ... £166 4 11	J. G. Bradley* ... £171 10 0
J. Carrick ... 179 18 0	

[All of Durham.] * Accepted.
EASTBOURNE.—Accepted for the construction of a gas-holder tank for the Gas Company. Mr. Henry E. Jones, engineer, Stepey, E.:—
G. W. Bell, Tottenham and Manchester ... £5,791

HUDDESFIELD.—For erecting ten houses, Deadwaters, for the Huddersfield Industrial Society Limited. Mr. J. Berry, architect, Huddersfield:—

Masonry.—Mark Brook, Leeds Road, Huddersfield.
Joinery.—George Ainley, Crossland Moor, Huddersfield.
Plumbing.—Ernest Mitchell, Milnsoridge, Huddersfield.
Plastering.—Broadbent Bros. Moldgreen, Huddersfield.
Painting.—Haigh & Shaw, High-street, Huddersfield.
Slating.—T. B. Tunncliffe, West Parade, Huddersfield.
Concreting.—John Cooke, Little Royd, Huddersfield.

LONDON.—For foundations of new police station, Cannon-row, and extension of chief offices at New Scotland Yard adjoining for the Receiver, for the Metropolitan Police District. Mr. J. Dixon Butler, Police Surveyor. Quantities by Mr. W. H. Thurgood:—

Nightingale ... £27,347	Holland and Hannen £20,560
Patman and Fotheringham ... 22,460	Colls and Sons ... 20,335
Mowlem and Co. ... 22,369	Lathey Bros. ... 20,300
Holloway Bros. ... 22,235	T. Parker ... 19,970
Bywaters and Sons ... 21,740	Cubitt and Co. ... 19,890
Sydney Hart ... 21,590	Ashby and Horner ... 19,690
Thompson ... 21,541	Lawrance and Sons ... 19,550
Dove Bros. ... 21,455	Greenwood ... —
Higgs and Hill ... 21,240	J. Carmichael ... —
Grover and Son ... 20,595	Scrivener and Co. ... —
	Trollope and Sons ... —

LONDON.—For erecting five cottages at New Barnet. Mr. F. Denzil Thomson, architect, Woodside Park, North Finchley:—
Brown and Sweetland £2,446 J. Smith and Son ... £1,785
Lye ... 2,298 Knight ... 1,640
Pointing ... 1,830

LONDON.—For rebuilding Mr. Hugh Reed's drapery premises, Powis-street, Woolwich:—
Chapman ... Accepted at Schedule.

LONDON.—For painting and decorative works at the Abbey Mills Pumping Station, &c., for the London County Council. Quantities supplied:—
J. Kybett ... £4,372 17 10 F. W. Harris ... £2,251 0 0
Vigor and Co. ... 2,812 0 0 E. Proctor ... 2,172 14 0
F. F. Foley ... 2,774 0 0 A. H. Inns ... 2,154 9 4
D. Gibbs and Co. ... 2,558 10 7 A. J. Wick ... 2,092 12 10

LONDON.—For erecting the first portion of a new building in Throgmorton-street and Throgmorton-avenue, City, to be used as a restaurant, shops, and offices, for Messrs. J. Lyons and Co. Ltd. Mr. Charles Bell, architect, 23, St. Swinburn-lane, E.C. Quantities by Messrs. Gardner and Theobald, 110, Gt. Russell-street, W.C.:—

Hall, Beddall and Co. £42,265	Holland and Hannen £39,360
Ashby and Horner ... 41,920	Foster and Dicksee ... 39,220
G. Trollope and Sons ... 41,310	Barnsley and Son ... 38,983
J. Mowlem and Co. ... 40,946	Colls and Sons ... 38,693
LOWER EDMONTON. —For alterations and additions and new stables to the "Cross Keys" public-house, for Mr. C. Gibbons, Messrs. A. Drews-Mercer and A. E. Taylor, joint architects, Granville House, Arundel-street, Strand, W.C.:—	

House.		Stables.	
A. Porter ... £6,697		£3,692	£10,389
J. Peerless ... 6,450		3,640	10,090
J. Weibking and Son ... 6,375		3,639	9,995
W. Gregor and Son* ... 6,350		3,236	9,546
W. Johnson and Co. ... 5,923		3,210	9,133
A. Monk ... 5,740		3,185	8,925
S. and J. Redhouse ... 5,485		3,242	8,727
C. Ansell, Lambeth* ...			
* Too late. * Accepted.			

MIDDLESBROUGH.—For new printing works, Short-street, Middlesbrough, for Mr. W. Appleyard. Mr. W. G. Roberts, architect, 61, Albert-road, Middlesbrough. Quantities by Mr. F. Cartwright, Sheffield:—

Full Tenders.	
W. A. King ... £2,443 0 0	Perks and Son ... £2,129 8 14
Joseph Howe & Co. £2,300 0 0	Allison Bros.* ... 2,060 0 0
Excavator, Concretor, Bricklayer, and Mason's Work.	
W. Pounder ... £1,356 1 2	John Davison ... £1,016 4 6
J. Johnson ... 1,139 15 0	D. Doughty ... 986 6 6
Jos. Coates ... 1,064 16 0	

Slating.
J. and R. Marscall £82 14 0 J. Harrison ... £80 14 0
W. B. Robinson ... 83 19 0 J. Davison ... 70 18 1
W. Tyreman ... 83 2 0

Carpentry and Joinery.
R. Sweeting ... £490 13 3 J. Davison ... £410 14 11
W. A. King ... 428 0 0 W. Thompson ... 379 9 6
Hudson Bros. ... 421 0 0

Plastering.
G. E. Jarran ... £92 10 0 J. Johnson ... £67 13 2
John Davison ... 86 6 6 S. W. Trepasso ... 57 17 8
J. R. Smiles ... 78 18 0

Ironfoundry and Smithing.
R. Sweeting ... £335 7 1 Hudson Bros. ... £252 15 0
W. Thompson ... 289 10 0 Baker Bros. ... 225 10 1
J. Davison ... 268 7 1

Plumbing, Glazing, and Gasfitting.
Baker Bros. £185 7 0 G. Ripley ... £174 8 2
Curtis & Bowman ... 181 16 0 J. Barwick ... 163 19 0

Painting.
W. Ridgway ... £28 14 3 W. L. Taylor & Sons £23 14 0
A. Lewis ... 25 10 3 J. H. Hill ... 23 3 4
J. Scott and Co. ... 25 8 6 E. Turner ... 19 8 10

NANTWICH.—For the execution of water-supply works, Spurstow, for the Rural District Council. Mr. J. A. Davenport, C.E., 152, Hospital-street, Nantwich:—

Pipe-laying.
Rowland ... £289 0 0 Dodd ... £191 5 0
Jowett ... 303 19 0 Dale ... 187 9 6
Small and Co. ... 237 16 6 Dodd ... 179 11 6
Birchall ... 236 0 0 T. Wood, Small ... —
Greedy ... 193 0 0 main-road, Crewe* 164 10 0
Newbale ... 191 15 0

Pipes and Specials.
D. Parsons, Brierley Hill.*
Fittings and Valves.
Blakeborough and Co., Brigham.*
* Accepted.

TUNBRIDGE WELLS.—For the erection of the lower portion of St. John's-road Free Church, comprising lecture hall, class rooms, kitchen, offices, &c. Mr. H. Y. Coley, architect. Quantities by Mr. H. Elwig:—
Strange and Sons ... £2,446 J. Jarvis ... £2,069
W. and F. Penn ... 2,344 J. Smith ... 1,992
J. Crates ... 2,280 J. Marshall ... 1,897

WALTHAMSTOW.—For the erection of school buildings, Queen's-road, for the School Board. Mr. W. A. Longmore, architect, 7, Great Alie-street, London, E.:—
J. A. Reed ... £22,655 H. J. Carter, Grays, Essex* ... £20,210
C. Gray Hill ... 20,970
Merridew and Wort ... 20,274
* Accepted.

WHITLEY (Northumberland).—For widening, &c., Marine-avenue, for the Urban District Council. Mr. J. P. Spencer, C.E., Newcastle-on-Tyne:—
Geo. Maughan, Jarrow-on-Tyne, schedule of prices.

CONTRACTS OPEN.

SOUTHBOROUGH URBAN DISTRICT COUNCIL.

VICTORIA HALL.

TO BUILDERS AND OTHERS.

The Urban District Council of Southborough, in the County of Kent, are prepared to receive TENDERS for the ERECTION and COMPLETION of the proposed Victoria Hall and Buildings in London-road, Southborough.

Plans and specifications may be seen, and bills of quantities, with forms of Tender, obtained at the office of Mr. WILLIAM HARMER, Surveyor, 137, London-road, Southborough, on payment of One Guinea, to be returned on receipt of a bona-fide Tender.

Tenders, with priced bills of quantities, to be sent in on or before SATURDAY, OCTOBER 15th, 1898, and endorsed "Tender for Victoria Hall," and addressed to the undersigned.

The Council do not bind themselves to accept the lowest or any Tender.

Dated this 20th day of September, 1898.
PHILIP HANMER,
Clerk to the Urban District Council.
Council Office, Southborough.

CORPORATION OF BANGOR. BUILDINGS.

The Corporation of Bangor is prepared to receive TENDERS for the ERECTION of BUILDINGS, CHIMNEY SHAFT, &c., for its Electric Lighting Station.

Plans and specification may be inspected at the Offices of JOHN GILL, A.M.I.C.E., Borough Surveyor, and at the Offices of F. HASTINGS MEDHURST, B.Sc., M.Inst.E.E., the Consulting Engineer to the Corporation, Westminster-chambers, 13, Victoria-street, S.W., from the latter of whom the bill of quantities can be obtained on payment of a deposit of Five Guineas, which will be returned on receipt of a bona-fide Tender.

Sealed Tenders, endorsed "Buildings," must be delivered to me on or before OCTOBER 15th, 1898.

The Corporation do not bind itself to accept the lowest or any Tender.

This Advertisement will not appear again in this Journal.

R. H. PRITCHARD,
Bangor, September 21st, 1898.
Town Clerk.

VESTRY OF ST. GEORGE-IN-THE-EAST. TO BUILDERS.

The Vestry of the above Parish will meet on THURSDAY, OCTOBER 20th instant, at SIX o'clock in the evening, to receive TENDERS for the ERECTION of an ADDITION to, and for the ALTERATION of the VESTRY HALL, in Cable-street, in conformity with plans and specification prepared by Mr. G. A. WILSON, the Vestry Surveyor, which can be seen at his Office at the Vestry Hall on any day during office hours.

Bills of quantities and forms of Tender may be obtained on application to the Surveyor on payment of £1, the latter to be returned on receipt of a bona-fide Tender.

Tenders, on the form supplied, accompanied by the priced bills of quantities under seal, are to be delivered to me under cover, endorsed, "Tender for Vestry Hall," not later than FOUR o'clock on the day name. Bank of England Notes to the value of £25 must be enclosed with the Tender, as a guarantee of bona-fides of Tender, the same to be immediately returned if Tender is declined, and to be retained in the case of the accepted Tender until the contract is executed.

The Vestry do not bind themselves to accept the lowest or any Tender.

By order,
Vestry Hall, H. THOMPSON,
Cable-street, E., Vestry Clerk.
October 3rd, 1898.

INTRODUCTION OF NON-FLAMMABLE WOOD INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to

Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"IOWA" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.

"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE E.G. DUN BUILDING, (each of which is over eighteen stories high).

"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,

2, Army and Navy Mansions, Victoria Street, London, S.W.

SANITARY CONGRESS.

THE INSTITUTE'S PURPOSE AND PROGRESS.

PRACTICAL PAPERS.

(Continued from page lxxvii.)

DR. J. F. J. SYKES (London) read a paper on "Dwellings of the Poor." Having canvassed the merits of different kinds of dwellings, the writer said that the cubic space per head was the most difficult point of all to deal with in practice, and must be regarded sanitariously as the most important. Calculated on a physiological basis, the requirement for the human adult was 10,008 cubic feet. We were continually bemoaning the large death-toll of consumption, or tubercular phthisis, essentially a disease spread by crowding, and the medical profession was now strongly advocating the cure and mitigation of the disease by fresh-air treatment. Was it out of place to advocate even more strenuously the prevention of the disease by fresh air, by the provision of more cubic space, and especially by raising the present inadequate minimum standard? The minimum standard should be advanced to 400 cubic feet at the very least. They were living in a fool's paradise if they thought they were going to succeed in providing the working classes with more breathing space without having the means of preventing it being compressed to its original proportions by the pressure of population.

INSANITARY AREAS.

Mr. Peter Addie (late manager of the Birmingham Improvement Scheme) read a paper on "The Removal of Insanitary Areas, and the management of Improvement Schemes under the Housing of the Working Classes Act." Having with the aid of maps and diagrams given an exhaustive account of the Swansea and the Birmingham Improvement Schemes, and of the dwellings about to be erected by the Birmingham Corporation in Milk Street, Mr. Addie went on to say that it was difficult to provide for a population of so diverse a character as the working classes. The respectable element was weighed down by a number of thriftless and unclean people, and, though this difficulty might be removed ultimately by universal education, he was afraid that many years would elapse before the dwellings municipalities so liberally provided would be appreciated and used to the best advantage. Among other difficulties spoken of in the paper was the reluctance which magistrates sometimes exhibited to make orders for the closing of dangerous or insanitary houses, the authorities having no appeal against their decision. This was one of the greatest blots in the Act. It was a matter of deep regret that many of the houses inhabited by the working class were in bad repair, and that infectious diseases claimed the majority of their victims from such houses. If the local authority did not step in, area after area became insanitary, and in many of our large towns there existed courts and alleys without number where perpetrators of crime or vice congregated. It was to be earnestly hoped that municipal representatives would study closely the provisions of the Housing of the Working Classes Act, so that these plague-spots might be abolished, and the lives of the working men be rendered brighter and happier.

ARCHITECTURE AND SANITATION.

One of the principal sections meeting on Thursday was that devoted to Engineering and Architecture. Mr. William Henman, as president, gave an address on the sanitary aspects of Architecture. According to his view, it is not only the function of the architect to produce artistic design and decoration, but to erect edifices which shall be at once artistic, safe, and free from sanitary defects. After glancing at the abuses of the by-law system, Mr. Henman turned to specific instances of defective building construction. He predicted the future banishment outside of buildings of

all traps and interceptors. If every house-drain were of suitable size, well ventilated, amply flushed, with well-laid and untrapped sewers, sewer gas might become a thing of the past. On the head of sewage disposal it might be that a new era was upon them if the "septic tank" fulfilled the promise of its so far rapid advance in public estimation. In regard to building materials, the use of glazed materials was often advocated for the exteriors as well as the interiors of buildings. Many architects, however, preferred materials of permeable construction. Ventilation was another subject glibly talked of and much misunderstood. Failures in applying mechanical means for sewerage ventilation in large buildings were, in his opinion, traceable to three causes:—(1) Too low an estimate of the volume of air required; (2) want of efficient mechanical appliances; (3) want of constant and intelligent management. So long as architects and the public shut their eyes to the ascertained fact that a change of air from seven to ten times per hour was essential for health and comfort, failure must inevitably result. Good health could not be secured in defective dwellings. Among the labouring classes the home was often defective. In Mr. Henman's opinion, the reason was to be found in the system of existing ground-rents. The excessive value put on land for building purposes, particularly that required for the houses of the working classes, was a leading cause of bad building.

HOUSE DRAINS.

Professor A. Bostock Hill read a paper—or rather it was read for him—on the construction and ventilation of house drains. He held that as to the size of drains, the smallest that would convey the necessary quantity of liquid was certainly best for purposes of cleanliness. The use of too large pipes was attended with grave disadvantages, such as the collection of putrefiable matter and the difficulty of flushing. The traps which, under the law, were commonly put at each junction of the sub-drain, held a considerable quantity of liquid and solid matter, and for the time being became a small depositing tank where solids in suspension precipitated themselves. The ventilation of sewers up private houses Dr. Bostock Hill regarded as a danger to health, and he protested against the method as utterly wrong in principle. He likewise protested against some of the systems of public sewerage, which, instead of preventing the formation of noxious gases, tended to bottle them up and discharge them some few feet above the roofs of private houses.

COMBINED DRAINAGE.

The subject of combined drainage was discussed by Mr. Joseph Priestley. In practice he would restrict the number of houses allowed in a combined drain to six or less, and have the combined drain itself intercepted and ventilated separately. But with more than six houses the main drain became a sewer, and each house drain separately intercepted therefrom and ventilated. Where the system of drainage was simplified and the drains kept outside by means of a combined system, it ought to be allowed, instead of a separate drain being insisted upon. When six or fewer houses were combined, the combined drains were to be intercepted and ventilated separately as a whole; but where more than six houses joined the main drain had better be treated as a sewer, and each house separately intercepted therefrom and ventilated. The pros of combined drainage were many and the cons few.

ENGINEERING AND ARCHITECTURE.

Upon the concluding day the Engineering and Architecture Section again met in the Medical Lecture Theatre of Mason College, under the presidency of Mr. W. Henman. Four papers were down for discussion.—Mr. Mansergh, the engineer of the Birmingham water scheme, occupied the attention of the meeting for upwards of an hour with an interesting description of the progress made with the Elan Valley undertaking. Mr. Mansergh first alluded to the responsibility of the Birmingham Corporation in regard to water supply,

and explained how they were compelled to make provision for water beyond the confines of the city. The total area of their supply embraced 130 square miles, or 10 per cent. in excess of that of the county of London. The probability of the pollution and failure of existing methods of supply in the course of a comparatively limited period caused the Birmingham authorities to look further afield, and the Rhayader district was hit upon on account of the prospect it held out of an abundant supply, and of its suitability.

ON THE GROUND OF GRAVITATION.

Mr. Mansergh pointed out the necessity there then was for immediate action, as the Metropolitan authorities were on the look-out for a gathering ground in the same locality. If Birmingham had not immediately gone to the Elan Valley, it was exceedingly likely that London would have forestalled them. Mr. Mansergh then proceeded to show the amount of water which the scheme would give Birmingham. They had calculated that the volume which would flow into the city would be 75 million gallons a day, after allowing for 27 million gallons per diem for compensation water to the river affected—a quantity which was something like six times the average flow of that river. Provision was made to meet a drought of 180 days. Of the 74 miles from the source of supply to Frankley the water would pass through 30½ miles of tunnel, and would take 44 hours in its passage. The lecturer showed by means of photographs the character of the district which would be submerged. Included in the area were the poet Shelley's home and many places of historic and antiquarian interest. He described how, step by step, the work of construction had progressed, and mentioned the measures which had been taken to provide against all chance of accident. The lecture concluded with a series of views of the locality.

RURAL SANITATION.

Mr. G. H. Smith dealt with some of the sanitary defects in rural districts, and made suggestions for their remedy. His contention was that the difficulty of obtaining pure water in the country was due to the supply being drawn chiefly from wells and watercourses which were liable to serious pollution. It was not uncommon to find the well and cesspool in close proximity, and the well consequently suffered. Rivers and watercourses were another source of water supply in country districts which were liable to easy pollution. Farmers, for instance, turned streams into washing places for sheep. As a remedy for this state of things he advocated an increase of the powers of rural authorities. Another sanitary defect was the condition of village cottages, the insanitary state of which frequently arose from bad buildings, insufficient repairs, and sanitary conveniences of the most primitive type. In these circumstances it was only their outdoor life which caused labourers to escape disease and early death. The most practical remedy was to grant power to the Parish and Rural Councils to obtain land and build cottages wherever it was considered necessary, and the money to do this should be raised on the security of the local rates. All inspectors of nuisances should hold certificates granted by that Institute, and, moreover, they should only be permitted to hold the one office.—In the course of a brief discussion, Mr. E. Smith, of London, thought an improvement would be effected if wooden cottages were erected.—This view, however, was opposed to that of all the other gentlemen who took part in the discussion.—The opinions expressed by the reader of the paper were generally endorsed by the meeting.

THE SEWAGE QUESTION.

The programme in the section devoted to Physics, Chemistry, and Biology consisted of four papers, all bearing upon the treatment of sewage, and the course was adopted of reading the whole string at the outset and allowing a general discussion towards the end of the sitting.—Dr. H. Kenwood, assistant-professor of Public Health, University College, London, opened by reading some observations on the natural purification of sewage, written in

conjunction with Dr. William Butler, upon experiments made last autumn on the Finchley Sewage Farm. The action of the anaerobia filter was described, and stress was laid upon the value of secondary filters. Dibdin's septic tank was discussed at length, and the result arrived at was that a bacterial filter was better than a tank. Dealing with the methods of analysis and standards, the writers expressed the opinion that a standard of effluents having a low limit of organic nitrogen was to be preferred to any standard of oxygen absorbed, or oxidised nitrogen. What was wanted was a uniform method of procedure in the taking of samples and in the performance of the analysis.—"The quality of sewage as influencing

ITS MODE OF DISPOSAL"

was the subject treated in a paper by Mr. S. Rideal. He explained how the choice of a system of sewerage must be determined by the quality of sewage and its quantity, as affected by local circumstances, and described the essentials of the "combined system," under which it is necessary to construct special arrangements for storm overflow; and the "separate system" in which the sewage proper is kept apart from rainfall and storm water. He emphasised the importance of the raw storm water of populous districts not being allowed to pass in large volumes directly into a stream. He detailed the efforts of varying qualities of sewage, and the alterations occasioned by mere mechanical straining or filtration, and also when being submitted to various other processes of purification.—Mr. W. D. Scott-Moncrieff dealt with "The Biolysis of Sewage," claiming to have reached something nearly approaching to finality in the results he had obtained. The working hypothesis for the advocates for the purification of sewage by biolysis was based upon the belief that the effete substances contained in sewage were within the capacity of Nature to deal with, unaided by the use of chemicals; and the problem really resolved itself into the discovery of methods by which Nature could be so aided in the case of sewage that it could be purified on the largest scale at a reasonable cost, without creating a nuisance, and without the aid of chemicals. The advocates of purely natural methods contended that after the changes which had taken place in the digestive organs, or even without them, bacteria were capable of completing the work of purification. Having described at length experiments he had himself made, Mr. Scott-Moncrieff said that what appeared to be certain was that full information could now be obtained both chemically and bacteriologically as to what actually went on during the whole process of nitrification, and he had provision for discovering if possible the point to which the anaerobic changes should be carried, and beyond which they ought to be arrested.—Mr. W. E. Adeney, Examiner in Chemistry at the Royal University of Ireland, read a paper on "The

BACTERIO-CHEMICAL ANALYSIS OF SEWAGE

and Sewage Effluents," in which he discussed the question whether, now that it was generally accepted that the purification of polluted waters was under natural conditions the work of bacteria, the methods employed for the analysis of the same waters should not be based upon the fact that they were fermentative liquids, and whether the information sought from analysis of them should not be the amount of fermentative matters apart from their other possible constituents. The writer described what he styled a simple process for the chemical analysis of polluted waters. In the course of the discussion which followed, Professor Frankland said that he did not think anything could surpass the results obtained by intermittent downward filtration and irrigation. The real point of importance was whether the effluent would enter into putrefactive fermentation when it entered a stream. Manufacturers were frequently guilty of wholesale pollution, and it seemed to him that the only remedy public authorities had was to obtain powers to compel manufacturers to distribute as much as possible the escape of waste liquors over the twenty-four hours.—Dr. Porter (Stockport) pointed to the streams in

the vicinity of Manchester as being altogether unfit for use for domestic purposes, and deprecated any legislation for sentimental reasons which would harass manufacturers.—Mr. H. Parry (Dublin) called attention to the fact that in all the suggestions brought forward nothing had been said about cost, and until some definite idea on this head was arrived at it would be impossible for engineers to deal with the question upon permanent lines.—Mr. Dibdin (Surrey) urged that in any system of purification care should be taken not to interrupt

THE CONTINUOUS LIFE ACTION

which went on in foul water. Purification depended more on the living organisms in the water than on chemical mixtures.—Dr. Hewitt (Norwich) gave the results of some experiments at Manchester, which showed, he said, that the effluent in the tanks could be so dealt with under Mr. Dibdin's process that it was good enough to turn into a slow-moving large body of water like the Ship Canal.—Mr. Arthur J. Martin (Exeter) advocated as most effective and economical the use of such septic tanks as were laid down at Exeter.—The President spoke with satisfaction of the great advance made since last year's Congress. Then they could only deal with generalities, but now they had definite data to go upon, and the authors of the various papers had provided sufficient material to keep them going for at least another twelve months.—The readers of the papers having replied to some of the criticisms raised, the section closed with a vote of thanks to the president.

(To be continued.)

ENGINEERING SCIENCE.

AT last a step has been taken in the right direction in connection with experimental science and the endowment of research, says Machinery. It will be recollected that last year an influential deputation waited upon the Premier to solicit his influence for the establishment of a natural physical laboratory, where facts could be determined, constants fixed, and instruments standardised. As Lord Salisbury himself not very long ago delivered the opening address at the British Association, the advocates of State assistance in the department of engineering science could hardly have addressed themselves to a more favourable arbiter. The Premier's response was naturally sympathetic, and in the end a small committee was appointed to report the result of their investigations. They took evidence, and went abroad to inspect one of the many institutions on the Continent which have been founded either by the State or by municipalities for the promotion of scientific education. Sir John Wolfe Barry was enabled to tell the folks of Bristol that the committee had sent in a report in favour of the establishment of the laboratory which was absolutely unanimous. After all we have heard recently from the President and Vice-President of the Council of Education it is a fair presumption that the Government will adopt the suggestion, and that a vote will be asked for by the Chancellor of the Exchequer in his next Budget. There is undoubtedly no field in which foreign competition presses us so severely as the work of the engineer. And, quite apart from the desirability in a general sense of stimulating scientific research, it is obvious that if we are to hold our own in the world's new markets we must meet our rivals with at least as good weapons as they employ.

OPPOSITION OF SCIENTISTS.

Bristol, of course, has historic claims upon the Association, for it held its first meeting in the old cathedral town in 1836, when Brunel, the famous engineer of the Great Western Railway, who built the Clifton Suspension Bridge, was engaged in the construction of the Great Western steamer launched on the Severn in 1837. Sir J. W. Barry seizes the successful venture in ocean steaming across the Atlantic as an illustration of the difficulties which practical engineers have to

surmount in the promotion of any novel enterprise arising from the opposition of scientists. When that Great Western steamer was on the stocks Dr. Dionysius Lardner wrote a lengthy dissertation on the subject of oceanic communication, and demonstrated to his own satisfaction, as well as to that of the theorists generally, that the resistance to a ship's progress must vary in accordance with her capacity; that the steamer would require a certain number of tons of coal per horse-power, and that no ship under such conditions, whatever her tonnage might be, could carry enough fuel for a voyage across the Atlantic. Naturally the public looked askance at the new departure. Nevertheless, the Great Western made her first voyage in 1838, and reached New York in 14 days with 200 tons of coal still left in her bunkers. Since her day the merest tyro knows that the larger the ship the greater the speed, given a corresponding increase in horse-power, and the less the consumption of fuel. So much for the predictions of the savant who, too often, shuts his eyes to the pernicious process of what logicians call "hasty generalisation," and becomes, in this way, instead of a pioneer in the work of progress, a stumbling-block in its path.

PREJUDICIAL DICTA.

Another instance of a similar character is recorded in the fierce opposition, which most of us can recollect, directed by Sir William Airy, the Astronomer Royal, against the designs of the Forth Bridge. He convinced himself that the engineers of the new bridge had neglected certain recognised laws in regard to the resisting power of long struts to buckling, and went so far as to say that the bridge ought not to be built, and that if it were, "we might reasonably expect the destruction of the Forth Bridge in a lighter gale than that which destroyed the Tay Bridge." Experience has proved how utterly erroneous the assumptions of the Astronomer Royal were. It is easy to see how prejudicial to the public interests these dicta of authorities may become. After the panic caused by the fall of the Tay Bridge the Board of Trade gave instructions that all railway bridges throughout the kingdom should be in future designed to resist 56lb. of horizontal wind pressure on the whole exposed area. These instructions are carried out to-day. But Sir John Wolfe Barry states that from experiments at the Forth Bridge on two wind gauges of 300 square feet and of 1½ square feet respectively, with the same conditions of wind and exposure, the larger gauge registered a pressure of 38·7 per cent. less per square foot than the smaller gauge. The designer and constructor of the new Tower Bridge had to contend against this very unnecessary insistence on the provision of 56lb. on the square foot. He was careful not to tell his audience what needless expenditure he had had to meet in order to comply with the requirements of the Board of Trade. Had he made public the futility of the obnoxious provision, in all probability the work would have been taken out of his hands. But the instances he has given of hasty assumption, and his own personal experiences, alike demonstrate the vast importance of the establishment of such an institution as the Physical Laboratory, where the various conditions which confront an engineer entrusted with such important works as those to which we have referred, may be thoroughly investigated by practical men, and the alliance of science and experience may be expected to produce grand results.

THE Sanitary Department of the City Corporation applied to his Worship for an order to have a house in Bow Street, the property of Rose Cunningham, closed as being dangerous to health. It was shown that the drainage was most defective, and the dwelling house was in need of limewashing. Sir Charles Cameron said the odour in the house was terrible, and there was an entire want of cleanliness, which was injurious to health. The order asked for was granted. Prohibitory orders were also made in the case of several other houses in which it was shown the sanitary accommodation was defective.

PRACTICAL CARPENTRY AND JOINERY.*

BY GEORGE ELLIS.

(Continued from page lxxviii.)

X.—SHUTTERS.

REVOLVING SHUTTERS are now coming into use for the insides of windows, and have much to recommend them on the score of simplicity and economy of cost and space. The vertical section, Fig. 165, illustrates the method of arranging these coils under a seat formed in the window reeess. Two purpose-made $\frac{1}{2}$ in. channel irons are fixed at the sides of the window, either in grooves in the linings or to wood plugs in the walls, as guides for the shutter. A stout rail is carried across in front of the sash sill, rebated to receive the guard iron. The latter is provided with a flush ring for lifting, which also engages with a tilting hook in the soffit when the shutter is lifted. The seat is hung to the back bearer to facilitate examination and oiling of the coil. The minimum space required for a coil, when the shutter is 6ft. high, is 10 $\frac{1}{2}$ in. Care should be taken that the spring is not wound excessively strong, as in the event of the shutter being allowed to run down, the guard bar would be torn off. These shutters may also be fixed in a recess behind a cornice, travelling over the soffit and down in front of the window, and thus fixed, are safer and more easily secured than when fixed under the window.

THE HINGED OR WALL SHUTTER is simply a thin piece of panelled framing about an inch thick, hung to the outside lining of the window frame in such a manner that when opened back it will lie close to the surface of the wall. The hinges used are called Parliament hinges, and are said to be so dubbed because their use was rendered compulsory by enactment; when window frames were first set back from the front of the walls,

these hinges, when open, have the appearance of the letter H, the connecting band equalling in depth the reveal, and enabling the shutter to complete a half revolution. The shutters are fastened by tower bolts, and kept open by turnbuckles, but they are not now in much use.

FRAMED OR LIFTING SHUTTERS are confined to shop fronts, and are made in sets, in width some equal division of the length of front, ranging from 11in. to 18in.; they are usually made out of $1\frac{1}{2}$ in. stuff, framed with flush panels, beaded, and the sides rebated together; the top ends enter a groove in the soffit; the lower are fitted with slotted plates that slip over studs in the stall-board, and when entered they are each moved sideways half an inch, taking the slot past the stud and thus preventing any outward movement. When all are in position they are further secured by an iron bar passing horizontally across from side to side, one end entering a slotted plate in the pilaster, the other being secured by a bolt passing through the story-post and fastened inside with a butterfly nut. These shutters are sometimes panelled in two thicknesses with a small space between, into which a thin steel plate is loosely fitted to prevent an opening being cut by burglars. The reason for having the plate loose is that it shall yield readily under pressure of any boring tool, and

FIG. 167. ELEVATION OF VENETIAN SHUTTER.

FIG. 168. SECTION.

iron mandrel with squared ends, which is fixed into bracket plates at each end of the shop front, in a box formed behind the fascia, or in a recess prepared beneath the bressumer. One end of the spring is secured to the barrel, the other to the mandrel, the hanging bands are fastened around the barrel, and the normal condition of things is that when the shutter is "up" the spring is at rest. The pulling down of the shutter winds up the spring, and the tension is so arranged that it is a little more than counterbalances the weight of the shutter when the latter is down; of course, as the shutter goes up, the weight to be lifted gets less, but at the same time, the spring in unwinding gets weaker, so that this compensation prevents the shutter rushing violently up when released. A groove about $\frac{1}{2}$ in. square should be formed as a guide for wood shutters between the plaster and the sash in preference to the iron guides supplied by the makers, as these latter rapidly chafe the surface, and eventually cut the ends through. Great care should be taken in fixing these shutters to make the barrel lie perfectly level, and parallel with the shop front, and to securely fix the brackets; self-acting lubricators should also be fitted to the bearings. Fig. 166 is a section through a fascia, showing the shutter fixed upon the face of the wall, where no provision has been made for same, above the front, when building. B is the spring blind, C the shutter coil, F a friction roller, the dotted lines indicate the position of fixing brackets, the remaining portions are obvious. It should be remembered in designing casings for shutters that the M.B.A. limits the projection to 18in. from face of wall. When the shutters are made of iron or steel for extensive frontages, they become too heavy for automatic action, and they are wound by means of rods and bevel wheel or chain gearing actuated by a small winch placed beneath the stall-board or some other easily accessible point. The laths of the iron and steel varieties are connected by wrought iron hinges screwed or rivetted at the backs, and the original patentees use them also for their best quality of wood shutters.

THE VENETIAN or louver shutter (Figs. 167 and 168) is principally used as a sun-blind for upper windows, and consists of two rectangular frames about three inches deep, filled in with louver boards, and capable of sliding along the face of the wall on each side of the window in a light frame fixed just above the stone sill. The shutters should be made of yellow deal or other light wood, dovetailed at the angles, and the louver boards housed into the sides. The guide frame should be of oak or teak and is fixed with wall hooks. A pair of brass pivot rollers fitted in the bottom edge of the shutter facilitates opening. Fig. 167 is drawn to scale of $\frac{1}{2}$ in. to 1ft., the remainder to 1in. to 1ft.

(To be continued.)

FIG. 166. SECTION OF A SPRING ROLLER SHUTTER FOR SHOPS.

FIG. 165. REVOLVING WINDOW SHUTTERS.

by its vibrations cause an alarm. A similar, but better method, inasmuch that it does not increase the weight of the shutter, is to fix pairs of hook plates upon the backs of the shutters in straight lines, and when every two or three shutters are in position, loose sheets of iron about 3ft. high are slipped in between the hooks, thus lining the entire front with iron, the last shutter to be put up has no hooks, the sheet resting upon a stud in the shop front.

REVOLVING SPRING SHUTTERS are made in iron, steel, and painted or polished woods, and although somewhat monotonous in appearance, are, in consequence of their convenience and security, fast superseding all other kinds for shops and public buildings. They consist, in the case of the wood variety, of a number of laths of plano-convex, oval, or ogee section, fastened together by steel or copper bands passing through their thickness and supplemented with strips of waterproof webbing glued along the back about every 5ft. The upper edge of each lath is rounded, and fits into a corresponding hollow in the lower edge of the one above it; this peculiar, overlapping joint, whilst preventing the passage of anything between the laths, readily yields when the shutter is wound around the barrel containing the spring. This barrel, usually of tinned iron, encases a stout spiral spring wound around an

STREET MUD.

MR. GILBERT R. REDGRAVE, Assoc. Inst.C.E., writing to The Times with reference to the experiments made at Cardiff in order to ascertain the amount of mud yielded by various qualities of macadam, observes:—"The subject is no doubt one of great importance to the authorities of large cities, and the values assigned to the materials tested will perhaps cause some surprise, unless due weight is given to the methods in which the tests were conducted. Three sets of tests are stated to have been carried out, and the substances named had to undergo (1) percussive attrition tests; (2) absorption tests; and (3) thrusting tests. The only description given of the first of these tests is that they were carried out by subjecting the specimens to 'rapid motion against the ribbed sides of an iron cylinder in a manner calculated to reproduce the action resulting from vehicular and other traffic.' The test No. 2 contains nothing novel in character, and it would seem that the test No. 3 was that ordinarily employed to ascertain the resistance to a gradually-applied load on a given surface. Permit me to state that tests of the same nature of those under No. 1 have long been adopted in America, in order to ascertain the

RELATIVE DURABILITY OF SUBSTANCES

used for paving and roadmaking purposes, and such tests are applied in a machine known as a 'rattler.' This machine, as described in the Journal of the Association of Engineering Societies of August, 1898, is a species of tumbling barrel, polygonal in form, having fifteen staves, revolving on trunnions, and driven at any desired rate by a constant-speed electric motor. The percentage of loss in weight of the specimens under trial, after a given number of revolutions in the rattler, can readily be ascertained and comparative results can be computed. Without a more detailed description of the machine employed by Professor Elliott at Cardiff it is difficult to say whether the results he has obtained would equal in uniformity those produced by means of the rattler, but it seems doubtful whether the ribbed side of the cylinder would fairly reproduce the action on the road materials due to wheeled traffic. The tests of Portland cement by abrasion are well known and are much employed on the Continent in cement testing, but they do not apply in this case. I should like to point out that Portland cement is never used neat for road making, and therefore that the value assigned to it in the table is most unfair. If the basalt samples had been crushed and mixed with good Portland cement in the proportion of one part of cement to eight parts of basalt, or other hard aggregate, the cement concrete would have occupied a very different place. I venture, therefore, to doubt whether very great reliance should be placed on the results quoted."

AN accident occurred some days ago at a new building, intended for the London Joint Stock Bank, situate at the corner of Wood Street and Gresham Street, E.C. The building had been fitted with concrete staircases, and while the boards that supported the concrete were being removed, the third floor staircase gave way and fell through to the basement. There were four men working on it at the time, all of whom were more or less injured.

Trade and Craft.

THE UNITED ASBESTOS CO. LTD.

The United Asbestos Co. Ltd., have just issued a revised price list, showing an appreciable reduction in the cost of many of their leading lines in "Salamander" decorations. The Company have been enabled to make these reductions owing to improved manufacturing facilities and the increasing demand for their goods.

Surveying and Sanitary Notes.

THE Bristol Sanitary Committee have discussed in private the report of Messrs. Taylor, Sons, and Santo Crimp on the question of the disposal of the city sewage. The scheme for discharging the sewage at Avonmouth and Dunball was most favoured by the committee. The engineers estimated the cost of the undertaking at £379,000, the sum required for repayment of capital and interest being £15,487, and, with an extra cost of £2000 for pumping, the annual expenditure would be about £18,000. It was estimated that after forty-five years the annual cost would be only £2500. The report will be sent on to the Council.

It seems to be the fate of Londoners, and in a lesser degree of Englishmen generally, to be behindhand in all modern applications of electricity. Figures recently collected for the United States Government show how backward we are in the matter of electric traction. There are altogether 1422 miles of electric tramway in Europe. Of these 707 are to be found in Germany and 87 in the United Kingdom. Even little Switzerland, with a population hardly greater than that of London, is ahead by three miles of our magnificent total. Yet the English towns which have adopted electric traction are able to furnish overwhelming evidence of the profit to be derived from tramways.

A SINGULAR difficulty has arisen in the making of a contract for water supply to the town of Carrickmacross. Tenders were received from a number of firms, and the Board of Guardians, having confined their attention to the two lowest, eventually decided by a majority to accept the tender of Messrs. Hagarty and Gault, although that of Mr. M'Kee, of Duncannon, was £66 lower. Mr. M'Kee, through his solicitor and in person, protested against this, contending that the Guardians should follow the usual practice, and a number of Guardians appeared to have come to the same conclusion, for at last week's meeting two Guardians proffered notice of motion to rescind the former decision. The chairman, however, refused these on the ground that an action for breach of contract might lie against the Guardians. At this week's meeting Mr. M'Kee offered to indemnify the Guardians, and to reduce his tender still further, but as it appeared that the bond had been perfected and work begun, the Guardians had, reluctantly on the part of some, to let the matter remain as it was.

Builders' Notes.

THREE valuable sites in important localities have just been secured by the Congregationalists for the erection of new churches. The first of these is at Herne Hill. The site just secured is on the Dulwich Park Estate, and within ten minutes' walk of Herne Hill Station. A site has also been secured at Harlesden, near Willesden Junction. The third site has been generously given for the purpose of erecting a suitable church at Ilford.

AN accident, resulting in the death of five men, occurred some days ago in Govan Road, Glasgow, on some premises in course of reconstruction. A large crane had been erected to assist the builders in their work, and this suddenly collapsed, carrying with it not only a large portion of the building, but a number of workmen. The building, which was five stories in height, was being converted into a lodging-house in the upper stories, with shops in the basement.

FOR several years past Giltspur Street, E.C., has been disfigured by a huge advertisement hoarding that marks the boundary of Christ's Hospital. Over and over again the hoarding has been denounced as a nuisance and an eyesore, and yet it remains in position. Some day—some day, by the way, has a habit of never arriving—the authorities will notice it, and then in a moment the place thereof will know it no more.

SIR GUILFORD MOLESWORTH has been engaged to inspect the Uganda railway, and will shortly leave England for the purpose. Further information regarding the extraordinary rift or gap in the country beyond the railroad shows that the engineering difficulties have not been exaggerated. The land falls suddenly away to a depth of thirteen hundred feet, and the dip is one in one and a half inches. This enormous fault in the surface extends for some three hundred miles, right in the path of the advancing line. To cross it will involve work of an exceptionally heavy character; to carry the line round it seems to be even more difficult. When Sir Guilford gets beyond the completed portion of the railway, which extends two hundred miles into the interior, he will find himself in dense virgin forest where travelling has to be done mostly on foot.

AN inquiry as to the propriety of confirming a scheme for the erection of eighty-three houses under the Labourers Acts was held at Wrexford by Mr. C. R. Lynch Staunton, Inspector Local Government Board. It appeared from the evidence that there have been 246 houses erected already in the union. It was proposed to allot half an acre to each cottage. Nearly all the proposed cottages are intended to replace condemned houses.

A VERY costly viaduct railway is being constructed in the sea at the eastern extremity of Dover in connection with the naval harbour works. The viaduct is being carried along under the cliffs to the point from which the great eastern arm of the harbour will run out seawards. The preliminary works in connection with the harbour are immense. In addition to the marine railway a permanent railway will connect the cliffs with the Dover and Deal line about four miles inland.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.

Property and Land Sales.

HAMPTON AND SONS,

ESTATE AGENTS, AUCTIONEERS, AND VALUERS.

1898.

HAMPTON and SONS beg to announce that their AUCTIONS of LANDED ESTATES, Town and Country RESIDENCES, INVESTMENTS, BUSINESS PREMISES, and other PROPERTIES are held MONTHLY at the Mart, Tokenhouse-yard, E.C. Auctions can also be held on other days in Town or Country by arrangement; also Sales and Valuations of Furniture, Pictures, Farming Stock, Timber, &c. List of Estates, Town and Country Residences, Hunting Boxes, and Sporting Properties can be had gratis on application to HAMPTON and SONS (Ltd.), 1, Cockspur-street, S.W.; or by post, three stamps. Auction and Estate Offices, 1, Cockspur-street, Pall-mall, S.W.

HAREFIELD GROVE ESTATE, near Rickmansworth, MIDDLESEX and WEST HERTS.

17 miles from London and two miles from two railway stations.

To be Sold by Auction, on Tuesday, October 18th, 1898.

MESSRS. MILLAR, SON, and CO., are instructed to SELL this beautiful FREEHOLD RESIDENTIAL, Sporting, and Agricultural ESTATE, in one or more lots, as under:—

Lot 1.—The unique Residential Estate, Harefield-grove, comprising a well-built, comfortable mansion, approached by a carriage drive, with lodge, occupying a fine position amidst most perfect surroundings of undulating lawns, luxurious shrubberies, lakes, ponds of aquatic plants, tennis lawns and courts, and containing five handsome reception rooms, conservatory, about 20 bedrooms, complete domestic offices; modern stabling, with clock tower, kitchen gardens, vineries, and other glasshouses; electric light plant; gardener's cottage, orchards, farm buildings, &c., the whole comprising 146a. 1r. 10p. of finely-timbered park, rich meadow, and woodlands.

Lot 2.—A beautiful Small Freehold Estate, containing nearly 20 acres of well-timbered park land, and having extensive frontages to main roads, and commanding lovely views; picturesque lodge, with carriage drive, and gates—a unique position for a good residence.

Lot 3.—A Building Estate of 7 acres, with a frontage of 485ft. to main road.

Lot 4.—A Building Estate of 7 acres, frontage of 520ft.

Lot 5.—A Building Estate of nearly 4 acres, frontage of 420ft.

Lot 6.—A Building Estate of 18½ acres, with extensive frontage to two roads, extending to 2100ft.

Lot 7.—A Building Estate of 11½ acres, with a frontage of 555ft.

Lot 8.—A similar Estate of 11½ acres, with a frontage of 680ft.

Lot 9.—Valuable Building Estate, comprising 21 acres, commanding nice views, with orchard and cottage, frontage of 1100ft.

All these Building Estates have excellent sites for large or small residences (for which there is great demand).

Particulars, plans, and conditions of sale at the Mart; of Messrs. FORD and Co., Solicitors, 6, Dowgate-hill, E.C.; and at the Auctioneers' Offices, 14, Grafton-street, Bond-street, London, W.

Sales for the Year 1898.—Telephone No. 669 Bank.—Telegraphic address, "Akaber, London."

MESSRS. BAKER & SONS beg to announce that their SALES of LANDED ESTATES, Investments, Town, Suburban, and Country Houses, Business Premises, Building Lands, Ground-rents, Reversions, Shares, and other Properties will be held at the Mart, Tokenhouse-yard, E.C., on the following Fridays during the year 1898:—

October 28 | November 11 | November 25 | December 9

Auctions can be held on days besides those above specified.—11, Queen Victoria-street, E.C.

By order of the Bridge-house Estates Committee of the Corporation of the City of London.—A highly valuable Building Site, covering an area of considerably over an acre in the heart of the City.

MESSRS. BAKER and SONS are instructed by the Bridge-house Estates Committee to LET by AUCTION, on Building Lease, for a term of 80 years, at the Mart, Tokenhouse-yard, on FRIDAY, OCTOBER 28th, at TWO o'clock, to be offered in one lot, and if not so disposed of in four lots, the important BUILDING SITE, comprising Nos. 5, 6, and part of No. 7, West-street, Nos. 36 to 48 (inclusive), Finsbury-circus, Nos. 2 and 4, Circus-place, Nos. 101 to 116, London-wall, and Albion Hall, with warehouses, &c., adjoining, occupying a total area of 49,000ft., and possessing frontages of about 750ft., offering magnificent sites for the erection of bank, insurance, and other offices, shops, professional or business premises, well worth the attention of builders, capitalists, and others, affording an opportunity seldom obtainable of acquiring prominent building sites in the City.

Particulars, plans, and conditions of sale of the CITY COMPTROLLER and CITY SURVEYOR, Guildhall, E.C.; and of the AUCTIONEERS, 11, Queen Victoria-street, E.C.

R. I.B.A. EXAMS. PREPARATION, R. personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Mr. W. CHURCH HOWGATE, A.B.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum).

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

R. I.B.A. SOCIETY of ARCHITECTS, and CIVIL SERVICE TECHNICAL EXAMINATIONS. Preparation by correspondence, in residence, or personally.—MIDDLETON and CARDEN, 19, Craven-street, Strand, W.C.

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

ASSISTANT.—WANTED, competent ASSISTANT. Working and detail drawings, quantities and specifications.—State age, qualifications, and salary required, to EDGAR M. LEEST, Architect, 109, Fore-street, Devonport.

WANTED, Architectural DRAUGHTSMAN for Land Agent and Surveyor's Office.—Apply, with salary and references, to "Country," Office of this paper.

ARCHITECTURAL ASSISTANT WANTED. Thoroughly conversant and capable.—Apply, with specimen drawing and reference, to BRUCE VAUGHAN, Borough Chambers, Cardiff.

ASSISTANT (first-class) WANTED in a leading City Architect's Office. Thoroughly competent in all branches. Preference to one used to public-house work.—Write first to HERBERT KNIGHT, 75, Aldermanbury, E.C.

GENERAL ASSISTANT WANTED. Usual qualifications, surveying, levelling, &c.—Apply, by letter, to W. WATKINS and SON, Architects, Lincoln.

ARCHITECT'S ASSISTANT (duly qualified) WANTED at once. Must be a neat and artistic draughtsman, and well up in construction.—Apply by letter, stating age and qualifications, and salary required, to ARCHITECT, care of J. W. Waddington, Stationer, Silver-street, Hull.

BUILDER'S ASSISTANT WANTED at once in a Jobbing Business. Must be practical and experienced. Well up in setting-out, measuring-up, and superintending work. Have good command of men.—State, age, references, and salary required, to W. BARRETT, Builder and Decorator, 65 and 67, Myddleton-road, Bowes Park, N.

APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

YOUNG ARCHITECT, A.R.I.B.A., DESIRES to ASSIST others in the PREPARATION OF DRAWINGS at his own office. G. SCOREE, 28, Newman-street, W.

PERSPECTIVES.

MR. E. B. LAMB, No. 31, Craven-street, Charing Cross, W.C.

BRICKWORK WANTED, by job or otherwise, in town or country. Good references.—Address G. W., 47, Jepson-road, Forest Gate.

MODELLER and CARVER desires RE-ENGAGEMENT. Well up in figure and ornament.—Address, A. M., BUILDERS' JOURNAL Office.

TO ARCHITECTS and BUILDERS.—Qualified Assistant, with spare time, renders assistance in the preparation of plans, details, inking in, and tracings for Architects.—80, Denmark-road, Manchester.

ARCHITECT'S JUNIOR ASSISTANT (20) desires RE-ENGAGEMENT. Good references. Four years' experience in good work. Neat and quick draughtsman. Probationer. Salary, 23s.—P. C. POLEY, Effingham House, Arundel-street, W.C.

ARCHITECT and SURVEYOR'S JUNIOR ASSISTANT desires an APPOINTMENT in or near London. Four years' experience. Capable of preparing plans from rough sketches.—"M.," The Limes, Earlsbrook-road, Earlswood.

BUILDER'S CLERK and ASSISTANT.—Measuring, quantities, estimating, and general routine. Used to superintending works in progress. Aged 27. Wages £2.—"M. H.," 17, St. Philip's-road, Dalston, N.E.

AN ARCHITECT of twenty-five years' experience desires a RE-ENGAGEMENT as CONFIDENTIAL ASSISTANT in London. Varied knowledge of Architecture, iron and steel work, valuations, &c.—"P.," 6, Kelvin-road, Highbury Park, N.

TELEGRAMS: LONDON TELEPHONE Dividore London." No. 1011, Holborn

"Essays in Criticism."

It is possible that the architect who studies these essays in criticism may involuntarily apply them, as he reads, to his own Art; and should he do so, he cannot but feel how great is the need for some such criticism on Architecture at the present day. During the period of fermentation and seeming confusion through which the plastic arts are moving, how great might be the service, how beneficial the influence, of so serene and dispassionate a critic as was Mathew Arnold. There is, indeed, room nowadays for such a man; one who, refusing to be led astray, or to attach himself too closely to any extreme of sentiment, will keep a cool clear head amidst the clash and din of conflicting opinions, and with eyes steadfastly fixed on

theology, philosophy, history, art, science, to see the object as in itself it really is." It is shown how this criticism must confine itself to the world of ideas, must resolutely decline to mix itself up with their application to practical purposes, or to lend itself to the point of view of the practical man; how in this country criticism having been so directly controversial and polemical—think of the battle of the styles!—has "so ill accomplished its best spiritual work, which is to keep man from a self-satisfaction which is retarding and vulgarising, to lead him towards perfection by making his mind dwell upon what is excellent in itself, and the absolute beauty and fitness of things." It is pointed out that the exercise of the creative power in the production of great works in Literature and Art is not, at all epochs and under all conditions, possible, and that, therefore, labour may be easily spent in attempting it, which might with more fruit be used in preparing it—in rendering it possible. That criticism, by creating a current of true and fresh ideas, tends to make an intellectual situation of which the creative power can profitably avail itself. "Criticism first; a time of true creative activity perhaps, which must inevitably be preceded amongst us by a time of criticism, hereafter when criticism has done its work." One cannot help asking whether much labour is not just now being vainly spent on attempted creative work in

question of current Architecture, what answer shall we get? Again, is it not refreshing to the serious lover of Art, surrounded as he is with so much exaggeration of sentiment, so much narrowness of sympathy, so much of a confident self-assurance that at times degenerates into blatant vulgarity—is it not refreshing to come across a sentence written in the tone and temper of this?—a tone and a temper that quite admirably express the spirit of these essays. "To try and approach truth on one side after another, not to strive or cry, nor to persist in pressing forward, on any one side, with violence or selfwill, it is only thus, it seems to me, that mortals may hope to gain any vision of the mysterious goddess whom we shall never see except in outline, but only thus even in outline. He who will do nothing but fight impetuously towards her on his own, one, favourite, particular line, is inevitably destined to run his head into the folds of the black robe in which she is wrapped.

A. R. J.

The Society of Architects' Examination.

WITH the holding, a fortnight ago, of its first examination of candidates for membership, the Society of Architects enters upon a new and eminently useful

STUDY FOR "WESTWOOD CROFT," NEAR LEEDS. FRANCIS W. BEDFORD, ARCHITECT.

the truth as he sees it, will resolutely uphold the standard of the ideal and the perfect. Remembering alway that Art is one and unique, and that an essential unity underlies all its various manifestations, whether in music, in poetry, or in Architecture, it cannot but be serviceable to the practitioner of any one branch to make himself acquainted with the best of thought and of criticism as it obtains elsewhere. It is hardly necessary to say that much of this best, as applied to Literature, is to be found in these essays; and there is also that in their general tone and temper of which we, as architects, are just now somewhat in need. Though first published over thirty years ago, there is much in them that applies with peculiar fitness and force to the position of our Art at the present day. It is impossible here to deal with all these essays in any adequate manner, but taking the first in order, we find it particularly interesting as being concerned with "the function of criticism at the present time," a subject of general application. In this it is pointed out that "of the intellect of Europe in general, the main effort, for now many years, has been a critical effort," criticism being defined as "a disinterested endeavour to learn and propagate the best that is known and thought in the world," its business being the "endeavour in all branches of knowledge,

Architecture, labour that might be more profitably employed in rendering it possible in the future? Whether the present is a true creative epoch? Whether we have either the "nationally diffused life and thought" which rendered Shakespeare possible, or "the quickening and sustaining atmosphere which the many-sided learning and the long and widely combined critical effort formed for Goethe." It is to be feared, that if the present revival of enthusiasm and activity in the plastic arts of this country be examined in the same calm and impartial method, and judged by the same standard as these essays, that the same judgment must be reluctantly passed on it as is here passed on the revival of poetry represented by Wordsworth, Byron, and Shelley—that it "has its source in a great movement of feeling not in a great movement of mind;" that "with plenty of energy, plenty of creative force, it does not know enough;" that lacking the materials and a basis supplied by a long continued critical effort, which is necessary for success in the highest sense, "a thorough interpretation of the world is necessarily denied to it." Then he asks how much of current English literature comes into this "best that is known and thought in the world;" to that the answer is—"not very much I fear." If we ask this same

phase of existence. Ever since the R.I.B.A. instituted its scheme of three examinations, each demanding arduous preparation, and necessarily preceded, in the case of the Intermediate and Final at least, by the preparation of several sheets of carefully prepared drawings known as "Testimonies of Study," there has been a demand for a single qualifying examination. There are many men, competent men, who are willing to study and anxious to possess an examination diploma, but earning their living as assistants or in practice, who have not the time at their disposal to go through the whole Institute course. Just here it is that the Society has come in. Without conflict with the older body, it provides a diploma for those who are unable, through one cause or another, to give up several years to study and the preparation of show drawings. Under such circumstances there may have been a temptation to make the examination of a lower grade than that of the Institute, at first at any rate; but it would have been a grievous mistake to have yielded to it, and, writing with both the syllabus and the questions set at the examinations before us, it is obvious that it has been resisted, while undue severity has been equally avoided. Except in the subject of sanitation, too much has possibly been asked of students in the limited time

allowed, making it exceedingly difficult to obtain the 80 per cent. of the total number of marks necessary to secure the Society's medal; but this is not a serious matter, and possibly an advantage, rendering it a real honour to obtain this distinction, so long as 50 per cent. necessary for passing can be earned by any competent and intelligent candidate. There is a remarkable evenness about the questions set, and between the papers in the various subjects, evidencing both a good board of examiners and some excellent controlling and organising influence. In design, the subject which has caused most trouble elsewhere, a great deal of difficulty is overcome by setting two alternative subjects; while the important subject of stresses, involving the scientific understanding of construction, is evidently in masterly hands, a minimum of knowledge, based on sound principles, such as every architect ought to possess, being demanded, without any encroachment on the province of the civil engineer. With such an examination so conducted, the Society is sure to advance, inducing many and good men to join its ranks; while its influence for good upon architects and Architecture is immensely enhanced. It is not the examination in itself which is of the greatest value, or even the diploma conferred, but the fact that every candidate, in the effort to succeed in passing, studies much which might otherwise be passed by, solidifies and systematises his knowledge, and prepares himself to take higher rank in his Profession in days to come, or the same rank in a profession whose average of attainments has risen. This latter is the more likely, and in the aggregate the more valuable. All round, the standard of attainment is rising amongst architects as amongst the members of all other professions. The stimulus to study such as the new examination will afford to many is a necessity of the times, and we welcome it accordingly.

G. A. T. M.

A SERIOUS INDICTMENT.

THE ALLEGED IDLENESS IN THE BUILDING TRADES.

THE allegations of idleness in the building trades, to which we referred last week, increase in number and strength. A Contractor says: "The architect's letter on 'Organised Idleness' in the building trades is but too true. If anything, he has understated their pernicious conduct to their employers. As a contractor with eighteen years' experience, and doing in that period a large amount of Government work, I feel I am in a position both to give an opinion and to support the statement brought before the public by your correspondent's letter. My experience teaches me the following: (a) That bricklayers, carpenters, plasterers, &c., enter upon their work with a determination and an understanding to do as little as possible, and in most cases this little is done against their will, with a view of prolonging the work and so prolonging their pay. (b) No work worthy of the name is performed before breakfast, and about eleven o'clock a messenger is despatched for beer, and under the influence of this the men are temporarily incapacitated from work. Should the employer object to beer being brought on the works all hands would lay down their tools, and, in a bullying attitude, demand instant payment of their money. (c) If by any possible chance the foreman ceases for an instant his close and untiring supervision, a suspension of work immediately ensues until such time as the supervision is resumed. (d) Workmen out of sight scarcely do anything, and there is such a combination among the men that on the approach of a foreman a sign is given, when all assume a deceitful diligence. (e) Apart from overtime, the full limit chargeable is 5½ hours per week, at an average price of 10d. per hour, which is

equal to a weekly wage of £2 6s. 3d., payable at noon on Saturday. The employer, as a return for this, gets, on an average, work which could be easily performed in thirty hours by a conscientious workman at a proportionate cost. (f) A foreman cannot exercise the authority due to his position; he cannot complain, or even comment adversely on the work. On the slightest assertion in this respect of his rights he is confronted with abuse of the most terrorising and intimidating character. This is the kind of aggression, imposition, and insolence which an employer has to meet and grapple with as best he can, and, as a result, a house, the labour of which should not exceed in cost £300, is to-day costing at least £550, owing to the systematic idleness and concerted oppression of the British workmen connected with these trades. For the reasons stated, it will be easily seen that conduct of this sort accounts in a large degree for high rents and high rates. I mention rates, for probably public bodies who employ this class of labour are penalised even to a greater extent than a private builder."

"A MOST SERIOUS MATTER."

"London Builders" write to the effect that "as large employers of labour in London, we must fully corroborate the allegations of 'London Architect.' It is a common occurrence for bricklayers and plasterers to come on a job, start work for one hour, and then give one hour's notice, simply for the purpose of obtaining two hours' pay, amounting to 1s. 8d., to be immediately spent at the nearest public house. It can be readily understood that the value of the work done during this period bears no proportion to the cost, most of the time being taken up in preparing to start, giving notice, and getting ready to leave. We had two such cases at one job yesterday. Again, out of a total of twenty-nine bricklayers employed upon this same building, only four started work before breakfast on Monday morning last, their labourers (about thirty-five in number), who, with a few exceptions, were present, ready to wait upon them, of course had to be paid in full. No wonder the cost of building has increased 25 per cent. within the last few years, when, in addition to these facts, unconcealed laziness, so aptly described by your correspondent as "organised idleness," is so prevalent. We are very glad to see this question taken up, as it is getting a most serious matter for the building trade, as well as for the public generally, who eventually have to pay, and we trust that the correspondence may lead to some tangible result."

"FROM BAD TO WORSE."

A "General Foreman" remarks: "As a builder's foreman of over twenty years' London experience, allow me to corroborate the charges made by 'London Architect' against the mechanics in the building trade. If the architects have erred it is by having underestimated the idleness of the men. I speak particularly in regard to the bricklayers. They have been going from bad to worse for some years, and have now reached a culminating point, when something must be done to stop this loss of labour and waste of capital. One of your correspondents says he can remember when a man would lay from 800 to 1000 bricks per day. On first-class work this was a recognised day's work of ten hours. Three or four years ago I could only get from 400 to 500 laid in the day of nine hours, but now the average number does not exceed 200 on precisely similar work, and for a foreman to complain (in ever so quiet a way) he is at once met with the reply: 'Brass up, guv'n'r, we have had enough of this,' and away they go, in many cases to return in three or four hours (the worse for drink) to insult and abuse him. I have sometimes had to call in the police. My firm opinion is that the trade unions are chiefly to blame for this state of affairs. If the builders would unite, and stand firm, they could, with the assistance of the architects, soon put an end to this robbery and hindrance. The foremen cannot do it themselves, which is palpable to anyone who knows anything about it. I am sure that nearly every foreman and clerk of works can testify in a general way to the above."

The "Bitter Cry" of the Outcast Architectural Assistant.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In his recent address to the Architectural Association, the President found in the largely increased membership a subject for congratulation. Though no doubt an excellent thing for the Association's finances, some people may be pardoned for finding in it room for much melancholy reflection on the status of the architectural assistant.

How many of the students who are crowding into the ranks are fated to achieve a practice and a competency? and how many are doomed to an obscure career as mere draughtsmen? To those who have neither the connection or push to gain the first, and who can only look forward to the dull career of office drudges, this large membership must be alarming. Still more competitors for their ill-paid posts! How many of the young aspirants to architectural fame are fated to get better remuneration than a carpenter or bricklayer?

The advertisement columns of the professional journals are a sad study to a thinking man. When we read of an assistant who can (apparently) draw, design, do perspectives in ink or colour, level, do accounts and quantities, write specifications, etc., etc., offering his services for little more than labourers' wages, do we think of the tragedy that may underlie it all, of the time and expense of his articles, of the crushed hopes, the penurious existence, the struggle with genteel poverty, the blank future? What do we think when we see middle-aged men toiling for others for their two or three guineas a week? Now and again a man by exceptionally hard work or special aptitude may rise to the pay of a shop-walker or builder's foreman. But for the crowd—who do not—what of them?

Is the Profession so overcrowded, or is it the worst paid under the sun? Five per cent. does not leave much margin for handsome salaries. Recently the writer was called upon to advise a schoolboy who wished to enter the Profession. After a long talk he said, "And when I have paid £200 or £300 for my articles, when I have worked as hard as a French agricultural labourer, and for as many hours a day as a bus-driver, when I have given my services as improver, been ground through the [A.A. curriculum, and passed the R.I.B.A. examinations—what may I expect to earn?" What was there to tell him? Two hundred a year? No! If he was lucky and very clever, thirty shillings a week! He was not dazzled at the prospect. But what must the assistant do? He cannot strike. If he has won a travelling studentship he will go abroad, and be made much of by the nations we despise. To their architects he is a *confrère*, to the rest an artist and a superior being. But in England he is a "clerk," scorned, scouted, socially damned; so let him return to his original obscurity, or tout for orders for builders' materials or books, and die a pauper—anything but blessing the malign fate that pitchforked him into "The Profession."—I am, Sir, yours faithfully,

A. R. I. B. A.

October 15th, 1898.

KEW OBSERVATORY, which the Parliamentary Committee suggest should form, so to speak, the nucleus of a National Physical Laboratory, is an unpretentious Government building, leased at present to the Royal Society at a nominal rent. It stands in the Old Deer Park, Richmond, which is Crown property, so that no difficulty would be experienced in the formal matter of transfer.

THE ARCHBISHOP OF CANTERBURY at Rugby recently reopened the school chapel. The building has just been enlarged at a cost of £6000, subscribed by old Rugbeians as a memorial to the late Rev. Philip Bowden Smith, assistant-master at the school. The Archbishop also unveiled a stained glass window erected by old pupils in memory of Dean Goulburn, formerly head-master of the school, and a marble medallion of Archbishop Benson.

MODERN LONDON WINDOWS.

BY RUPERT C. AUSTIN.

THE subject reminds us how dependent we are upon windows by means of which to avail ourselves of the stray gleams of sunshine which occasionally break through the canopy of London fog and smoke.

Many improvements have been made of late years in opening up the more crowded thoroughfares, and more will follow. Let us avail ourselves to the fullest extent of these privileges, and confer an everlasting boon on posterity by introducing as much light and air as we are able to in our buildings; and if our efforts in this respect are to be crowned with success, art must go hand in hand with science to attain the end in view.

London, like many other cities, has suffered artistically from the commercial instincts of its inhabitants; it is this commercialism which saps the very foundations of our art. From end to end of London we are confronted by buildings of which even the bricks and mortar are defiled by the grimy hand of commerce. So much the more is it incumbent upon us therefore to make a record of those buildings which have not sprung from an ignoble source, though the comparatively small number of such buildings makes the task a somewhat difficult one.

One brilliant exception has been planted right in the heart of the enemy's camp. Let us hope that it will be followed by others.

This window is sketched from the Passmore Edwards' Settlement, Tavistock Place.

The window lights a large hall opening off a corridor on the first floor, approached by an ample staircase.

The treatment of this gable end is decidedly

WINDOW AT THE PASSMORE EDWARDS' SETTLEMENT, TAVISTOCK PLACE, LONDON, W.C.

uncommon, the large central semi-circular window with its deep reveal, combined with the horizontal lines of the flanking windows, forms a very pleasing composition. The piers in the side compartments are alternately angular and circular, the entasis on the angular ones

is very strongly marked, the capping is a small hollow moulding enriched with pateræ, the spaces between are tinted blue, the bases to the columns are plain cubes.

There is a bold simplicity about the grouping which is very telling; perhaps the entasis on the pilasters might, with advantage, have been a little less marked, but it does not seem to be so obtrusive on the detached circular columns. It was a pity that stone was not used in the dressings of this window, but doubtless the choice was not optional.

The coping is formed in finely dressed stone, and the surroundings are of red brickwork.

82, Mortimer Street, introduces us to a higher type of art, in which figures are employed, and not merely as decorative adjuncts, but with symbolic purpose, and so justifying their existence.

It is not often that one has the opportunity of studying work of this class in London, where good sculpture is so rarely met with. What usually passes as sculpture (saving the name) creates a feeling of profound depression, especially when one thinks that someone must admire it; if not, why is it there?

To return to the subject: the idea of "Night" and "Morning" is here vividly portrayed. On the right hand is "Night," a female figure, with shrouded head and sunken form, the face in deep shadow, the embodiment of the toil and weariness of the day brought to its close.

On the left is "Morning," a full-grown man in the prime of life and strength, just awakening from sleep; latent strength is well expressed in the boldly sculptured muscles. The drapery in both figures is well handled and without mannerism.

The architectural detail in this window is not so happy as the figure work; it is rather coarse in parts, as, for instance, in the key block, round which is a returned string, for no apparent reason whatever.

The mouldings in the pediment are not very happily chosen—in fact, all the detail has a tendency to coarseness—but the charm of the figures amply compensates for any defects in this respect. Breadth of treatment has been aimed at rather than over-refinement, and, in the main, the result is highly satisfactory.

In the accompanying sketch, taken from a portion of the Imperial Institute, we have a much broader treatment than in either of the previous examples. This is partly due to the difference in scale of the buildings, but not wholly so, as other parts of the same building

WINDOW AT 82, MORTIMER STREET, LONDON, W.

WINDOW AT THE IMPERIAL INSTITUTE, SOUTH KENSINGTON.

are much smaller in detail than either of the former windows.

At first sight this little pailion seems hardly a part of the parent building, but upon closer examination one can detect similarity between them.

The main cornice arrests one's whole attention. Its deep soffit forms a splendid shadow, in which the obvious weakness, for there are no modillions, is well counteracted by the semi-hexagonal buttresses occurring at frequent intervals; between these buttresses are three lighted windows.

The bed mouldings of the cornice, which are bold in outline, break round the buttresses, sufficient soffit being allowed for this feature. Just below the bed mouldings is a course of red brickwork. This is repeated again below the architrave, on a line with the underside of the necking of the engaged columns. The frieze is quite plain, and the architrave composed of slight mouldings; the soffit of the architrave is supported by detached and engaged columns, dividing the window into three parts; the plinth block of columns dies on to a three times weathered and deeply-splayed cill. This cill forms one of the most telling features in the composition, the steepness of the weathering conveying the idea of great depth of masonry.

The string below the cill breaks round the buttresses, and further on becomes the top of the cornice to the adjacent building. Just below this string the hexagonal form of the buttress terminates, and is continued as a pilaster.

It may be seen from the sketch that the whole effect of this piece of work lies in the deep recesses, rather than in the depth of the mouldings employed, a far more legitimate means of obtaining a result than by increasing the depth of the mouldings.

In conclusion, I should like to draw attention to the porch and vaulted corridor, which are both charming in their way, the vaulting of the latter being highly enriched with colour decoration.

The workshops in Newman Street, Oxford Street, in which Messrs. Liberty's cabinets are made, has been totally destroyed by fire. The property destroyed, besides the building, consisted for the greater part of unfinished work.

New cottage homes and schools have been built by the Chorlton Board of Guardians at Styal. The new buildings have cost a little over £50,000. There are fifteen cottages—thirteen to accommodate twenty children each, and two for ten each.

THE GREAT CALIFORNIAN UNIVERSITY.

NO BRITISH ARCHITECT AMONG THE CHOSEN ELEVEN.

NOT one of the eleven plans selected by the Antwerp jury for the Great Californian University, to be erected at Berkeley by Mrs. Phoebe Hearst, was by a British architect. This notable fact caused a Daily Mail representative to wait on Mr. Norman Shaw, who represented Great Britain on the jury, on his return from Antwerp, and to seek from him an explanation. Mr. Shaw pointed out that although a British architect was not among the eleven selected, it did not follow that an architect from these isles had not submitted a plan. The names of the successful eleven were alone published; the identity of those who failed was not disclosed. At the same time Mr. Shaw said it was quite possible that

NO BRITISH ARCHITECT HAD ENTERED the competition. The principle of architectural competitions was "blown upon" in England. Public buildings erected on this plan had always been more or less a failure. Mr. Shaw instanced the Houses of Parliament, the huge block of Government offices in Whitehall, and the Law Courts. Plans for all these had been selected by open competition, and in no case could the result be called successful. Furthermore, such competitions had at times been marked by proceedings the reverse of above-board. British architects had come to distrust them. Mr. Shaw felt a twinge of national regret when no English name appeared among the selected eleven, but he was not surprised for the reasons given. The Californian University is to be designed on a magnificent scale. The ground on which it is to be built extends for one mile and a-half, with a breadth of half a mile. It rises from 200ft. to 700ft., and is well wooded and watered by two running streams. These natural features have been taken full advantage of by the architects. The buildings are to be detached, thus giving ample room for enlargement as the University grows. Broad corridors figure freely in the plans and spacious courtyards—courtyards big enough to take in St. Paul's Cathedral and leave ample space to drive round it. The competition had been held in the hopes of

DISCOVERING SOME ARCHITECTURAL GENIUS. In this it had failed. But the plans selected were remarkably clever. They were all without exception of the French school. While

admitting the excellence of this school, Mr. Shaw could not resist a feeling of regret that a University for an English-speaking race should not be modelled on English designs. The University towns of Oxford and Cambridge, St. Paul's, the Banqueting Hall, and the finest structures of Inigo Jones, might all suggest models for a University in thorough keeping with the genius of the Anglo-Saxon race. Architecture is more

THOROUGHLY TAUGHT IN FRANCE

than in England, said Mr. Shaw, and this, no doubt, accounts for its character being stamped on all the chosen plans. At the same time French teaching destroys individuality. It must also be remembered that English architects have always been weak in public buildings, but excel in private houses, churches, etc. The French are the reverse. "Allow me to say one word," concluded Mr. Shaw, "regarding the kindness and courtesy shown to the jury by the town of Antwerp. Every assistance was rendered to make our task lighter. The jury had no light task. The work of weeding out was done most carefully. The plans rejected were all finally examined after rejection in case any points had been overlooked." The final cost of California's University will be nearer twenty million pounds sterling than twenty million dollars.

THE TRAINING OF ENGLISH ARCHITECTS.

Mr. G. A. T. Middleton seeks to apply a lesson taught us by this competition. He writes:—"As one, possibly the only, Englishman who competed, I should like to say that the fact of my having been fairly beaten is no proof at all that there is no British architect capable of holding his own with foreign competitors. It only shows that the many who have higher reputations than myself were too busy to spend months in the solution of an exceedingly difficult problem on the mere chance of success, preferring rather to be contented with the certainties already in their hands. For myself, I should, of course, have liked to have been one of those selected to enter for the second competition, but at the same time shall feel amply rewarded for the trouble taken if my failure but serve to draw attention to the great need there is for the more systematic training of architects in England. In this I am heartily and entirely in agreement with Mr. Shaw, and like him, I see the danger of following too closely the Continental system, and so creating a dead level of mediocrity, levelling down the few men of brilliance while levelling up the majority. The remedy which I have now consistently advocated for many years is an entirely English one—to allow young architects to be trained by apprenticeship, as is usual now; but before permitting them to practice, to insist that they shall pass certain qualifying examinations, as is done in the professions of law and medicine, and so inducing study along proper lines. Two such examinations exist, for entrance into the Royal Institute of British Architects and the Society of Architects respectively; but they are greatly reduced in value and hampered in efficacy by the fact that they are not compulsory upon all intending members of the architectural Profession. To secure this, legislation must be invoked; and it is exceedingly difficult to obtain a hearing in Parliament for a non-party measure of this sort."

"A BEAUTIFUL DREAM."

Mr. T. J. Councell, of Bristol, commenting on Mr. Middleton's letter, says:—"Mr. Middleton's argument is an old one; and I fear that Parliamentary legislation on this subject is but a beautiful dream. But could not the legislature—while powerless to insist that all architects and surveyors shall be qualified by examination before practising publicly—lay down the law that no person shall be able to practise in the above Profession unless he has been articled to the Profession, or has had practical experience—for three years at least—in an architect's or surveyor's office? I do not know if this would solve the problem; but I am sure my brother professionals will hail the day when mere 'jerry' builders and such like will be powerless to call themselves architects, &c."

ARTS AND CRAFTS.

NOTES ON A NORTHERN EXHIBITION.

(Continued from page 148.)

BY A SPECIAL CORRESPONDENT.

CONTINUING our notes of last week, perhaps the work that attracts most attention is that of the honorary members of the Guild, who are few in number, and all of whom have had some influence either in its formation or have identified themselves with its aims. Mr. Walter Crane shows some exquisite black and white drawings, the originals for the illustrations to the Shepherd's Calendar; also the original drawings for his peacock and fig wall paper, together with one of the spectral printed versions of it by Messrs. Jeffrey and Co. The original is very refined and restrained in colour, with all the bloom and richness of a piece of good old tapestry, but the reproduction is in a printing that quite rearranges the designer's ideas, and is too assertive for anything but a public room. Some cartoons for glass by Mr. Crane are excellent examples of a good use of glass in drapery, but drawn as they are in coloured chalks, they fail to suggest in any degree the characteristics of glass colour or glass painting. Near to these are hung cartoons for glass by Mr. R. Anning Bell. These, drawn in charcoal, are open to the same criticism. Drawings that are intended for translation to a material so unlike paper as glass is should be capable of easy translation. The glass painter is mainly dependent for form on his leads and his solid traced lines, and in a secondary way only can rely on shading. Cartoons intended to be worked from should therefore be drawn in definite lines and are most likely to work out well in the glass, if the maximum use is made of the solid black, and the minimum amount of shading added to support and elucidate it. Few glass painters could be trusted to translate Mr. Bell's muggy and uncertain shading into glass painters' technique without losing much of the charm of the originals. Mr. Frederick Shields shows the cartoons of two rose lights for tracery, in which the style of drawing is such that the glass painter could absolutely reproduce his ideas. A set of autotype reproductions of glass cartoons by the same artist, by their masterly drawing and finished beauty, may be taken as expressing the ideal of a man who leaves nothing to chance, but faces all the difficulties of the craftsman and overcomes them. Such work is a good corrective to the modern impressionistic school, who not only leave much to the inartistic craftsmen, but a great deal to the fertile imagination.

Mr. Anning Bell shows two of his well-known plaster casts in low relief, which are less beautiful than his usual work in this direction.

Mr. Fred Jackson, of the Manchester Academy of Arts, exhibits a painted frieze. The advisability of using figures of almost life-size, in a room some 18ft. long, is questionable, and only possible by reducing the colour scheme to an unpleasantly low scale. Accepting the low scale of colour, the general effect is pleasing, and the painting, as might be expected, handled with skill and breadth. The frieze has been spoiled by the addition of gilded tablets on which are badly-lettered inscriptions.

A portion of a painted frieze by Miss Dacre, and some charming pastel studies for the same, are extremely clever; and her ability to understand and translate children to paper or canvas, is of an order all too uncommon. Miss Dacre takes the trouble to finish her work, and you can consequently understand precisely what she means.

One of the sweetest bits of colour in the exhibition, and the only really serious embroidery, is a piano front panel, by Mrs. E. E. Houghton and her sister. The subject is

"The Effect of Music on Different People." A fawn plays on pipes in the centre, while children, listening, assume attitudes of mirth, sadness, &c. The effect, as a whole, is very good, and the workmanship excellent; but there might have been less monotony in the stitches used, and the background and foreground lack repose.

Mr. Cadness shows some working drawings for woven fabrics, good in design and interesting as showing the working methods of the textile designer, and some good embroidery designed by himself and worked by Mrs. Cadness.

A few Manchester cotton prints are exhibited by Mr. Caspar Holding, which are more pleas-

the whole of the result is obtained without painting by the selection of shaded glasses and leads of varying thickness; a mosaic of coloured glass. The colour of much of the glass is very choice and unusual.

In an ante-room Mr. Pearce shows some glass for a Manchester church, which, being electrically illuminated at the back, is seen to full advantage. It has been worked by Messrs. Allan Hughes, A. L. Duthie, J. M. Brydone, and T. Twitchett. It is very brilliant in colour, and is remarkable for the bold and able use of opalescent, iridescent, and variegated glasses, in conjunction with antique glass of several hues in one piece.

The treatment is specially devised to

CHANCEL WINDOWS AT ST. GABRIEL'S CHURCH, HULME, MANCHESTER.
BY WALTER J. PEARCE AND J. A. HUGHES.

ing than the usual cheap cretonnes, and impress one with the idea that he is trying to raise the level of this class of work, while of necessity conforming to the demand of the purchaser in a general way.

Drawing for the daily press is illustrated by Mr. Wm. Palmer, who shows side by side the sketch, the photo on zinc, the stereotype, and the finished print.

Mr. Pearce sends a number of stained glass exhibits, which are characteristic of the class of work that he affects. In most of the panels

counteract the greyness and dimness of the light in the crowded district of a manufacturing city like Manchester, and the glitter and translucent beauty of the glass should do this.

Mr. A. L. Duthie sends some clever work on similar lines; his panel termed "Penance" is perhaps the best of these. A. McPherson exhibits some good simple glazing of much merit, and Mr. Bishop shows a leaded "fish-panel," which is noticeable.

Cotton prints are shown by Mr. Lewis F

PANEL OF LEADED GLASS FOR BILLIARD ROOM. BY WALTER J. PEARCE.

Day, also printed velvets and wall paper. Mr. Day's work is probably the most successful commercially and the most possible technically of any of our modern designers, and he stands out prominently as a healthy example to our younger men, as one who gives the merchant and the manufacturer what they want, and what they can sell, in his own way and of his own kind.

A case of printing by Mr. H. C. D. Chorlton, who is also responsible for the general printing of the Guild and for the catalogue, possesses many of the qualities of the work of the Kelmscott Press, but lacks personality. No. 217, "Designs for Printers' Ornaments," is sufficiently distinctive to show that if he would follow less he might very well lead.

A number of architectural drawings are shown, no less than three architects exhibiting drawings for their own residences. That by Mr. J. Gibbons Sankey, M.A., F.R.I.B.A., is distinctly fresh and characteristic of the author. He has frankly made and accepted his plan, and his elevation has grown out of it with the result that we have a most unconventional suburban house. The friezes of figures are a telling feature in the elevation. Mr. Sankey's recent work in Manchester constitutes the most noticeable contribution to its street architecture that it has seen in recent years.

Mr. Frank Mee's residence is of the thoroughly sensible and dignified type that we expect from him—a convenient, well-planned, and not ill-looking house—a good house to live in, and pleasing in its elevations.

Mr. Henry Goldsmith's house is not well shown in the drawing sent in. It is an interesting and comfortable-looking house on a good site and presents decidedly picturesque aspects. One can fancy it is well planned and has genuinely cosy corners.

Mr. Edgar Woods' architectural drawings are as drawings extremely artistic, and his choice of perspective points of view are well chosen to display the quaint features of his houses. There is a rugged elementariness of construction which one hardly associates with modern ideas of convenience and comfort, and a tendency to ignore the experience of the past.

Mr. Woods' houses are externally as picturesque as some old country cottages, but appearances imply that internally they may be quite as incommensurate and comfortless.

It is a pity that the better drawings are crowded up by a number of trifling scraps and sketches that usually remain in the portfolio, and are devoid of general interest.

Mr. Sidney C. Houghton contributes a bold pencil drawing of a Hall designed for Messrs. Waring and Gillow.

To sum up the results, we note in the whole exhibition the silent action of the wholesome leaven that Mr. Walter Crane left hidden in Manchester. The sooner it pervades the whole mass of Manchester designers the sooner Manchester will take her true place among the centres of industrial Art.

In our last issue we mentioned the catalogue and the essays published in it. A more lengthy survey in no way lessens our admiration for this very useful brochure.

The literary part of the work is distinctly praiseworthy. The essays are, on the whole, well-written; and, coming from a number of individuals, some of whom are probably unused to literary work, reflect considerable credit on the Editorial Committee.

Mr. Walter Crane and Mr. Lewis F. Day have, of course, the advantage of experience, and as both are lucid and telling technical writers, with something definite to tell us, their ideas are always worth listening to. Mr. Day's paper is a very much-needed contribution to the much discussed question of past ideals and present requirements, and every practical designer, of whatever craft, should read it.

Mr. Reginald Barber gives us his terse and logical views on an equally open subject of discussion—i.e., the relationship of the pictorial and the decorative in art.

Mr. Burton takes up the cudgels in favour of the utilisation of nineteenth century advantages for nineteenth century pots, pans, and tiles, and, like Mr. Day, has no sympathy with any attempt to put back the clock.

Mr. Cadness, whose beautiful headline block takes the highest place among some good efforts, discourses learnedly on the weaver's craft, and gives some valuable information to designers; and Mr. Walter Crane's paper on embroidery and needlework is a useful sequel to it, carrying the use of threads in pattern to its fuller and more expressive development.

Mr. Charlton's paper on printing is, perhaps, too much an echo of what we have heard from the late Mr. William Morris. Many of the ideas are excellent, and the maxims without reproach, but we somehow feel that the setting and printing of the papers are evidence that the writer does not practice what he preaches.

Mr. Foster contributes a paper on Architecture. Claiming much for Architecture, he dismisses the subject in a brief and superficially considered two pages, which might, perhaps, be spared.

Mr. Richard Glazier gives a chapter on the influence of material upon design in a manner one associates with his position as a teacher and as Head Master at the Manchester School of Art. Mr. Hilton's chapter on enamels gives some information on this rather abstruse subject to those who do not understand it.

Mr. Pearce, on the opening of his essay on painters' processes, displays much impatience at the slovenly and imperfect craftsmanship of the very modern art worker, and is outspoken upon the duty of the Guild. One drops with a sensible jerk from this tirade into a series of businesslike recipes of how to do better in at least one department of Art work.

Mr. James Smithies, on repoussé work, is instructive, and gives many "wrinkles" to the uninitiated.

Mr. Edgar Wood brings up the rear with a direct and well-expressed article upon Nature in design. Mr. Wood writes impulsively, but his views are based upon knowledge, and are well considered. He falls into serious error, however, when he says that the architect has furnished us in the past with our true designers and decorators. It is to the old trade guilds and craftsmen that we owe the best of our past work; to that day when each man gave his time and his very soul to the acquirement of one craft, and by tradition handed on his knowledge to be augmented by his successors.

PUBLIC BUILDINGS FOR EAST HAM.

NOTES ON THE COMPETITIVE DESIGNS.

[BY OUR OWN CRITIC.]

THIS competition was one of somewhat unusual interest, for it is not every day that the opportunity occurs of designing a whole group of public buildings; it is surprising, therefore, that so few competed. As it is, even with so small a number, the arbitrator can have had no easy task to determine their respective merits. In endeavouring to ascertain the general lines on which the award was made, a reference to the conditions show that certain sums were specified as the cost of certain blocks, and that while it was left to the competitors to consider whether it was advisable to have them detached or otherwise, yet the estimated cost of each building had to be stated, and the future enlargement of any of the buildings had to be provided for. Possibly the arbitrator might consider that these conditions would be best fulfilled by buildings that were separated, and this may have influenced him in some degree in his choice of designs whose superiority over one or two of the others is not at first apparent.

Why is it the usual thing—as here specified—to build a Public Library and Technical Institute combined? It is hardly necessary; it adds greatly to the difficulty of planning; it prevents either section being as perfect as it might otherwise have been; and makes the artistic expression of the character of the building quite an undertaking.

The conditions also specify that the large public hall shall be on the first floor. This is a pity. No doubt, in the centre of large towns, where space is restricted, it has become a necessity, and so regarded as a matter of course; but in a scheme like this, where there is more room, it would have been better to allow the competitors more discretion in the matter; for there are many advantages to be obtained by placing the hall on the ground floor. When it is on the first floor, unless it is over an open market, or some such arrangement, there is always a difficulty in lighting the space underneath and in obtaining a pleasing effect; and in this case, where this

PANEL OF LEADED GLASS. "PENANCE." BY A. LOUIS DUTHIE.

ROUGH SKETCH DESIGN FOR A HOUSE. J. GIBBONS SANKEY, M.A., F.R.I.B.A., ARCHITECT.

space is occupied by offices, most of the competitors have seen nothing else to do but to put a wide central corridor, with a light at each end.

On this point, the first premiated design, No. 7, by Messrs. Henry Cheers and Joseph Smith, is not so good as the second, by Messrs. Spalding and Cross, or as that submitted by Messrs. Lanchester, Stewart, and Rickards. Not content with having the length of the hall to deal with, the authors of No. 7 add an extra block on at either end, and so make it worse, the lighting of entrance hall and corridor being very inadequate. The second premiated design gets over this difficulty more successfully, but wastes space in doing so.

There are several arrangements in both these premiated designs to which exception might be taken. The main entrance to the public hall—in the first premiated—is not well placed, and has a most unhappy effect in the perspective, and the most important position in the whole group of buildings—the post of honour—is awarded to lavatories and retiring rooms. In the public baths—and this applies to both designs—no proper arrangements are made for getting the dirty linen to the laundry, though here the second premiated is better than the first, though, on the other hand, the second shows no box for attendant in the slipper baths; while in the library block he places the librarian in a most awkward position; and, in the office block, his town clerk is much too far from the Council chamber.

The design submitted by Messrs. Lanchester, Stewart, and Rickards, was certainly—as a plan—the most attractive of all. It showed an idea of setting out and grouping; but possibly the fact that the offices, hall, and library had been grouped together told against it; if, as before suggested, separate buildings were preferred. A design submitted by Messrs. F. Baggalay and Ashley and Armstrong, and one by Mr. J. Hatfield Smith, were both more on these lines, and both designs of interest, but time did not permit of more than a passing glance.

The inevitable humorist was a gentleman who back-lined his plans.

ON THE STUDY OF DESIGN.*

BY G. H. FELLOWES PRYNNE, F.R.I.B.A.

HOW much is comprised in those four words "the study of design," and how many times during the past century it had

A PANEL IN COLOURED GESSO. ST. AUGUSTINE.
BY H. GUSTAVE HILLER.

been thought that a sure foundation for principles of study had been found, and how many times this had been upset by the shifting sands

* An address delivered at the opening meeting of the session of the Architectural Association School of Design, held at 56, Great Marlborough Street, W., on Tuesday, the 11th inst.

of fashion and individual opinion. Putting aside for the present the individual faddists, or, as some unkind people might call them, "mad-dists," we come face to face with three schools of thought:—One that would prefer to accept the traditions and the fashions of the past ages as the most perfect, and adhere to absolute correctness of style—which for convenience we will call the "Stylographic" school. Another that, while accepting the traditions and fully appreciating the beauties of Classic, Gothic, and Renaissance work, etc., and using the study of the same as

THE FOUNDATION OF ALL GOOD WORK, yet aim at blending what they feel is best in past work, and so gradually developing something new and original, although built upon old foundations. This may be termed the "eclectic school." A third, that would discourage the acceptance of traditions, or study of the styles of the past, and try and again commence at the beginning of things; bring the building, in fact, back to a state of nudity, and commence again the process of creating new styles and fashions for its decoration, and, further, would tempt the architect away from much that has been considered necessary in the past, such as the sketching and measuring of old work, except only so far as it tends to make them ideal craftsmen, as well as architects. One is tempted to call this

THE "CRAFTY SCHOOL,"

but as this might be misunderstood, we will be content to call them by the good old name of the Arts and Crafts School. . . . Much that has been written and said of late years, the bitterness that has been at times mixed up with argument by certain men of extreme views, has done but little to advance the cause they would uphold. On the other hand, the plain, outspoken, honest opinions of men who are known to have knowledge, experience, and ability at their back have received, as they always will, the careful consideration of the best thinkers and hardest workers in the Profession, and undoubtedly these views, if not accepted as a whole, have had an invigorating and helpful effect in many ways upon the Profession generally. . . . We, as an Association,

accept as a fact that there is much good in all these schools of thought, and we do not hesitate to advise pupils to study well the early history and development of Architecture. We confine their studies to no particular date or style; we encourage them to appreciate

WHAT IS BEAUTIFUL

in form and ornament, and we leave them unrestricted opportunities, and encourage them in every way possible to show their own individuality in design. And, further, we wish to encourage them in the study of the craft side of their art, not, however, necessarily to become craftsmen themselves, but as a necessary accessory to perfect design. Time is far too short for me to enter upon even the fringe of such a subject of debate as the best manner of teaching and learning to design, but personally my strong advice to you is to follow the course laid out for you in our curriculum—a curriculum that is, as I have before said, both simple and comprehensive, and in no way exclusive. By no means neglect in any way the early study of the history and development of our art. Do not put yourself on the pedestal of a false god, and puff yourself up with the idea that you can create something out of nothing. All that is beautiful in man's architectural creation in the past is simply a gradual development of man's powers of design, which, however, is like all other evolution, of gradual growth, and built up upon what has gone before. The more careful the study, and the fuller the appreciation of all that is beautiful in old work of whatever style—the more large our capacity for grasping the best points in designs of the past—the more likely shall we be able to “design with beauty and build in truth.” I do not for a moment wish to assert my own opinion that this or that mode of learning to design, or this or that style of work is right or wrong, but all experience in Nature, history, literature, art, and science teaches one lesson that I dare not ignore in dealing with our own art of Architecture, and that is that, unless we build upon the foundations of past experience, unless we make use of the ladder that has been gradually raised for us by

THE GENIUS OF PAST ARTISTS,

the result in design will be chaos. In saying this, do not please imagine that I am advocating the slavish copying or repetition of styles. My sympathies are entirely in another direction. I should deprecate as strongly as anyone the idea of a long period of a student's valuable time being taken up by the study of Classic orders and Gothic styles. But my contention is that our early education should be based on all that is best in past work, whether in style, ornament, proportion, or construction, so that our future designs, however free and untrammelled by previous styles they may, at least, be free from the vulgarity and eccentricities that so often pass for cleverness, but are, in reality, only a thin cloak to hide ignorance, as in the case of the Impressionists' art in painting, which in the hands of a clever and expert painter can be made so beautiful, is often only adopted by an inferior painter to cover ignorance and bad draughtsmanship. So it may be, and so it often is with

ECCENTRICITY IN ARCHITECTURAL DESIGN.

Yet at the same time, if we ever want to get any originality and freshness in design, we must not be afraid of eclecticism and the free treatment in design. There is, perhaps, no man who scared and horrified the men of the stylistic school more than the late J. D. Sedding, by his boldness and freedom in design and clever eclecticism, and yet there is no man whose genius and architectural enthusiasm has had a greater influence upon our art during the latter part of the nineteenth century—and at the same time there is no man who entered more fully into the spirit of ancient work, none who was more saturated with the principles of mediæval work, or who sympathised more with the motives that inspired the Renaissance movement. It was a thorough knowledge of, and sympathy with, the exquisite proportions of Classic, the absorbing beauties and developments of Gothic, and a love for the freedom of

Renaissance work that made the blending of all, with his own artistic feeling and ideas, such a success. It is the want of such knowledge and sympathy with the past that so often leads

HIS WOULD-BE COPYISTS

to utter failure in design. Again, I must strongly advise you not to be drawn away by the theories of any school from the principle of making sketching an all-important part of your study. It seems almost incredible that any real artist should decry the necessity of sketching, and yet in the endeavour to press the hobby of craftsmanship amongst architects, the art of sketching, it has been stated, is an unnecessary qualification. Do not, I say, be led astray by such theories. If you think that actual craftsmanship is desirable, and undoubtedly to some extent it is, by all means make it part of your study, but on no account for this reason neglect your sketching. By sketching freely you will fill the storehouse of your mind with ideas, for sketching will leave a far more indelible impression than reading, notes, or even the most careful survey of work. It will help more than anything else in design, and it will enable you to illustrate your ideas to others with a rapidity and preciseness that you will find most valuable. Your first business should be to become a good draughtsman—and make it your special care to be correct in your drawing—as few things are more injurious to the architectural draughtsman than

SLOVENLY AND INCORRECT DRAWING.

Having suggested the line of early study, let us now consider for a few moments the best way of applying that study to design. When starting on a design, the first thing before putting pencil to paper is to endeavour to acquire the habit of seeing clearly in your mind's eye what you want to design. By picturing your design in your own mind before attempting to draw, you will not only save time, but prevent much confused work. It is necessary that you should see in your mind plan and elevation together, and train yourselves to realise the effect of a building in perspective from different points of view. To enable him to do this with greater ease, the student will find that it is a great help to continually sketch small portions of his proposed design, quite roughly with chalk on the blackboard, or a piece of charcoal, or soft pencil on paper. The great use of these

SMALL ROUGH PERSPECTIVE SKETCHES

will very soon become apparent, as by their aid you will soon find out many small oversights and weak points that might otherwise easily have escaped you. When designing a building, let the perfection of plan be your first and all-important aim—at the same time, whilst planning keep in mind, as far as possible, both internal and external effect of your plan arrangement. But remember that, however fine an exterior may be, it can never atone for a faulty internal plan. If you want your plan to give pleasure, whilst studying convenience in every way, avoid making your rooms merely a set of parallelograms or what I might call a T square and set square house of the common type. It is by a reasonable and harmonious variation of the plan, that charm and artistic effect will be obtained both internally and externally. Clients, as they sometimes do, insist on a design in a certain style; still the hand of the true artist will, while adhering to the principle of the style chosen, so adapt it and mould it to his own feelings that it will bear the undoubted

MARKS OF HIS INDIVIDUALITY

and originality. . . . As regards ornament, I cannot too strongly advise you in your earlier attempts in design to leave ornament alone. Try and get your effects by simplicity of treatment, by the masses and grouping. A building that is not good in itself and in its proportion can never be redeemed by ornament. The very practice of reserve necessary for simplicity of treatment is an excellent training. Many more buildings are ruined architecturally by the misapplication of ornament than by plainness of design. But with ornament remember

that nothing is a more sure test of a man's intelligence and refinement when it is properly used, and nothing stamps the ignorance and vulgarity of a man more than

BAD OR MISUSED ORNAMENT.

Ornament in design should never have the effect of being simply stuck on without definite reason. The task of the artist in the formation of the constructive parts of a work is so to shape and connect all the details as to cause the whole to develop itself, as it were, organically. Any creation is perfect in exact proportion to the perfectness of the parts of which it is composed. Any work of art is perfect by the perfection of its parts, and by the organic relation in which those parts stand towards one another, and towards the whole. By such formation of the constructive and ornamental parts of a design, correct in themselves, correct in their relation to each other, and correct in their union as a whole, there will be produced a work in harmony with the laws of style, which, being the free creation of the hand of man, will express the use and purpose of its existence in a clear and intelligible way, and, like speech itself, will be the expression of the intellect and genius of its originator.

A RUINED CHURCH IN SUFFOLK.

THE Church of Trimley St. Mary is best known in Suffolk for that it shares the same churchyard with the Church of Trimley St. Martin, a quaint distinction which has few parallels in England. Both these buildings are used for divine service, and have separate rectors. Externally St. Mary's is but a wreck of a once stately structure, and its incumbent has taken the opportunity, in his efforts to bring about a better state of things, to bring before the public some of the many points of interest of the ancient fabric; more ancient than the days of Thomas de Brotherton (1300—1338), its sometimes reputed founder, since portions of the building indicate a considerably earlier date. De Brotherton's arms are on the central of five quarterfoils over the fine Early Perpendicular doorway, but those of Roger and Hugh Bigod, Earls of Suffolk long before his time, are also to be seen lower down. The Earls of Suffolk and Dukes of Norfolk were, from what the Rector styles, with perhaps unavoidable vagueness, the

“EARLIEST TIMES”

patrons of the living, and remained such until 1545, when the Duke of Norfolk exchanged it with the manors of Walton and Falkenham, and the rectories of Walton and Felixstowe, for Castle Rising, with Henry VIII. Since then the patronage has been vested in the Lord Chancellor.

THE TOWER OF THE CHURCH

is now in picturesque ruins, and its crown is covered with ivy, but although the porch has been much mutilated, enough remains of this part to show how beautiful it must have been, “and,” adds the Rector significantly, “enough, happily, to guide an architect to a faithful restoration of it. The major part of the detail in the interior is of the Decorative period, and the great thickness of the walls indicates a still earlier origin, a fact illustrated by the Norman dog-toothed mouldings on some of the stones. The stately arch at the west end is now bricked up, and things would be much improved if it were thrown open, and the window glazed. The font was presented in 1856 by Earl Nelson, brother of the then rector, the Rev. J. Horatio Nelson, and in the previous year the church underwent a partial restoration, when, along with the good, some poor work was introduced. The beautiful features of the edifice are still, however, numerous, and the Rector thinks that an eminent architect, with £2000 or £3000 at his disposal could make it the most interesting in East Anglia. The restorations of more immediate necessity require at least £1000 to effect, and the urgent necessity of re-roofing the nave, re-flooring, and providing heating apparatus, is the chief claim which the Rector brings forward.

THE ARCHITECTURAL ASSOCIATION.

PRESIDENTIAL ADDRESS.

(Continued from page 155.)

It may be objected that the cost of these models of wood, stone, and metal construction, and of plumber's work, with which, in my opinion, the Association should be furnished, would be very considerable. If they had all to be especially made, this would certainly be the case. But I would suggest the following method for the commencement of work in this new department. 1st. That the initial expense to the Association would be the necessary fittings, tools, and materials. When these were once obtained the

FEES FOR THE WORKSHOP COURSE

should be more than sufficient to pay the remaining expenses. 2nd. That the services of experts in each of the various trades should be obtained at a reasonable fee, and that the duties of such experts should consist of descriptive and practical lessons in setting out work on the board from scale drawings, and as to the best application of that setting out, to the actual materials, so as to obtain the best results and avoid unnecessary waste—to give

ACTUAL WORKING DEMONSTRATION

on the bench or otherwise, in preparing, and afterwards putting together, the model to be constructed. 3rd. To superintend the students' work in carrying out various portions of the same model or other work he may set them to do. 4th. That certain members should be invited to become visitors, and that they should from time to time set a subject for a model, or a problem, and give designs and details, say $\frac{1}{8}$ " and $\frac{1}{4}$ " scale, to be worked out in proper materials by students to $1\frac{1}{2}$ " scale, or larger, as the subject might allow. By this means it will be at once seen that in a few years the Architectural Association would have a most valuable set of models always ready for reference, made by the students themselves, under the supervision of an expert, and without any other than the ordinary running expenses being entailed. When

OUR COLLECTION OF MODELS

was large enough, no doubt the students who made future models would be glad to keep their own handiwork in memory of the happy hours spent in the demonstration workshops of the Architectural Association. I may here remark that the manual labour involved in working out these models and details to scale is a very different matter to working on large planks and heavy stones in a builder's yard, yet, for all practical purposes, the teaching would be the same, and that without injury to the hands for drawing purposes. Please forgive me if I seem to have dwelt on this subject at some length, but I feel so strongly that this addition to our curriculum would be such a popular and useful feature in our future work that I could not refrain from expressing my views plainly. There is one other class that I should like to see revived in connection with the studio, and that is drawing from the antique and from the life. I say revived, because as far back as 1864 a class was started for this end, but from lack of the method (such as we now have) it fell through. I cannot but think that such a class would be found very useful to many of our members of all ages. I sincerely trust that my picture of

WHAT WE HOPE FOR

in our new premises is not merely a fancy one or fated never to take substantial form, but that ere long we shall see it an accomplished fact, and that our long and patient waiting will only make us value the more our new home, wherever it may be. At the commencement of this paper I addressed you as fellow-students in Architecture. Believe me, I

meant this to be no mere form of words. I take it as a simple axiom that we are one and all students in our beloved art, and this is an axiom that cannot be too often repeated, for I fear that after passing through the first stages of studentship, and commencing practice, many are far too apt to agree with the sentiment of such an axiom without carrying forward their studies, and thus building up upon the foundation of their earlier Architectural education. It may safely be asserted that no profession or art needs more keeping up and continuous study than Architecture, and it is equally certain that an architect who ceases to study, not only by book-work, but by travelling and sketching, becomes sooner or later a more or less repeating machine. His ideas crystallise, and

HIS DESIGNS BECOME COLD AND LIFELESS.

It is for this reason that I hope one and all of our members will claim the honourable name of student in Architecture. We are only on different stages of the ladder. To those who are just commencing their climb let me say, look well before you start. Consider well what are your qualifications. Can you honestly say that you love art for art's sake, that you are prepared to work hard, and in a great measure to sacrifice your pleasure for your art, that you do not take up Architecture merely because it is a respectable profession—if so, then I think you may go forward with every confidence of future success—but if not, for the sake of your future happiness and welfare, you had far better turn back before it is too late. If you seek an easy-going and lucrative profession only, do not become an architect. The practice of Architecture is neither easy nor lucrative; on the contrary, it is one of the hardest working and most poorly paid of professions, as a large number of its members have, I am afraid, learnt from sad experience. On the other hand, the man who sincerely

ENTERS INTO THE TRUE ART

side of Architecture will experience great pleasure in his work, a pleasure that it would be hard to surpass, if indeed to equal, in any other profession or calling, and although wealth will be within the grasp of comparatively few architects, yet with a true love for his art as his main guide, with industry, ordinary business capacity, and last, but not least, absolute integrity in all business transactions, he will almost invariably be sufficiently successful to render his professional career a happy one. In speaking of Architecture as a poorly-paid profession, I am reminded of a somewhat amusing episode. A client of mine wrote a certain sanitary surveyor and auctioneer, &c., who she had previously employed on some sanitary work, complaining that his charges, which I may say amounted to over 15 per cent. on a total expenditure of some £1600, were greatly in excess of the charges of architects whom she had employed before on other house work. The answer of the sanitary surveyor and auctioneer, &c., was to the effect that of course his charges were quite a different matter to those of an ordinary architect.

HE WAS A SPECIALIST!

This, at least, indicates that there are some people who think that architects must be poor sort of things to charge so little, and in passing, I cannot help remarking that our system of charges does seem somewhat an anomaly. The Scott, Street, or Pearson, of his age, charging precisely on the same scale as Mr. Tom Brag, architect, auctioneer, and house agent. It is somewhat like a Millais or Leighton charging at the same rate per square foot of canvas as Mr. Daub, who once succeeded in getting one of his pictures marked with a big D, and hung in the Academy. The result is too often that the men who have made a name get more than they can possibly attend to properly, whilst the less-known men get little or nothing to do. I feel that, from an Art point of view, it is an utterly wrong system, but as the public, our patrons, would not be satisfied unless there was an equal schedule of charges, I acknowledge the difficulty of finding a remedy. Having, in the early part of my address, referred to some of our smaller weaknesses in working, I think I may now fairly congratulate the

Architectural Association on its otherwise prosperous position. Our roll of membership is the highest on record, and you will be glad to hear that our members have reached a total of more than 1220. This in itself is sufficient to show how widespread is the interest that is taken in our work, and how popular our Association has become in every branch of the Profession. Added to this, I am glad to say that, in spite of necessary extra expenditure, our financial position is still sound; and again, that our position from an educational point of view is equally sound, in that our many able instructors are content to remain with us, and to thus place us in a position of being able to offer students advantages in Architectural education far superior to that offered by any other institution of the kind. But these are not the only

SIGNS OF ENCOURAGEMENT

or success. The rejoining of several old members who had allowed their membership to lapse, and the joining of some new members whose names are well known in the Profession, has been quite a feature in the commencement of this session. Amongst the former I must mention our old friend Mr. Arthur Cates, who has been reinstated as a member on his own request, and has paid up his subscription for no less than thirty-four years, placing him now in the honoured position of the oldest living member of the Architectural Association, and amongst the latter are Mr. H. T. Hare and Mr. Edwin T. Hall. We extend to these gentlemen, and to all who have joined our ranks, in like manner, the hand of good-fellowship and warm welcome, and we hope that they will not be content with adding their names to our list of members, but will help us from time to time as occasion may require with their counsel and advice, or in such of the voluntary work that still happily remains a part of our system. It is here that I would venture to make an especial

APPEAL TO THE PROFESSION AT LARGE

to join our ranks, as by so doing they will not only help us morally by their sympathy, but by their annual subscriptions will help the educational work of the Architectural Association financially. We year by year gratefully acknowledge the valuable help and support given us by the Institute, without which we should find it difficult to keep up the standard of our work. Whilst I cannot but consider that the Institute, as the leading architectural society in the land, only do what is their bounden duty in helping forward the educational work of the Association, yet the help they give us is the more valued, because it is given freely, and without being trammelled with conditions, showing that the Council have faith in both our system and our officers. The generous financial help given by several leading architects, when the Association most needed it, at the commencement of our present scheme of education, will always be remembered with gratitude. We cannot, however, expect this kind of help except

ON VERY ESPECIAL OCCASIONS,

or for very exceptional purposes. Surely it is not too much to expect from other architects, who have been fortunate and successful in the practice of their art, and who have not previously helped our cause, that they should come forward and help to the best of their ability, the great work of education being carried out by the Architectural Association. Is this work to be left to a few hard-working architects, whose enthusiasm and love for the future welfare of their art urges them to give their time and talents ungrudgingly for the cause—can we allow it to be said that we, as a Profession, are so selfish, so warped in our ideas, so wrapped up in our own small centres of art, and petty personal interests, that we forget, or will not take the trouble to remember, there is a great cause to be worked for as well as that which more closely concerns ourselves? Surely not! If the helping of our younger brethren in their early architectural training tends to the good of that great cause and the advancement of our art, as I maintain it does, then, surely, it is the duty of all to do what they can for that end. Some

twenty-five years ago, when I was in the Western States of America, on the shores of Lake Superior, an American friend met an old priest, who was a most eloquent preacher, and asked him why it was he was content to stay in the, then, Wild West, on a poor income of 500 dollars a year, when, with his powers, he could get 5000 dollars in New York. His answer I have always remembered. He said; "What you say may be true—what is 5000 dollars to me compared with my duty to the great cause; I was sent to take charge of this district. I am doing my little best to fulfil my duties; when my work is done, my little best will go to strengthen the great whole, and so the work of the great Church advances." I only give this as an illustration of a noble example of self-abnegation, for the benefit of the whole body, and as it is applicable to any act of unselfishness, for the good of others. Although the great cause referred to in this simple anecdote is, of course,

INCOMPARABLY GREATER THAN OURS, yet the same principle applies. In common with that of the artist, our art of Architecture, which is itself noble and refining, calls into existence one touch of the Divine Faculty—creative genius. We have, in that art, a great cause to work for, and the more we can make our individual work tell, for the good of the cause as a great whole, and the more we can help others forward in working for that end, the better it will be for ourselves and for the advancement of our art. Amongst the other encouragements in our work it is satisfactory to notice the growing interest and increased attendance at our fortnightly meetings, and the success of the Discussion Section. It is often a cause of wonder to me how it is that the papers at these meetings keep up to such a high standard as they do. As a set of educational papers they are most valuable, and judging from the titles and well-known names of the readers of papers for the present session we may hope for excellent results. I do hope that members will

PROVE THEIR APPRECIATION

by a large attendance, and further that the younger members will try and join in the discussion after the papers. An excellent syllabus of papers has also been arranged by the energetic members of the Discussion Section. The papers of this section are often exceedingly good, as may be judged from some of those we have published in the Architectural Association Notes. I should strongly advise students to join, as the meetings are so arranged as not to clash with other class work, and it is here that they will be able to gain confidence in asking questions and speaking in public. There is another side of the Architectural Association work which is most useful, and is now as successful as it has ever been. I refer to

THE SOCIAL SIDE.

Now there are some to whom this side of our system is somewhat a stumbling-block. They think, and I have heard some say, that it seems a pity we should spend money on such frivolities as our annual soirée and members' smoking soirée. I must entirely disagree with those who would cavil with us on this point. Their objections arise either from an entire misconception of the objects of our social gatherings, or else from want of experience in the work of such a society as the Architectural Association. I can, of course, conceive that it would be easy to let the social side become a too prominent feature in our system, which would be distinctly injurious to its main objects. But under our present elective system, in which a very large body of men of tried experience have a voice, I believe there is no danger of such an evil happening. The social side of the Architectural Association is, and I trust always will be, one of its great features, contrasting as it does favourably with that

COLD RED TAPE SYSTEM

that would dub every kind of relaxation as undignified, and every penny that was spent on it as wasted. To speak more strongly, I would say that the social side of our work is one of our sheet anchors. Take away that social side and you will have a model in still life, perfect

perhaps in its form, but lifeless and without soul. Indeed, so strongly do I feel the great use of the social side of our work, that my great wish, as I have before stated, is to see a modified form of club life established in connection with our new premises. It is this social side that is one of the main wants of the Institute. It would give it a kind of life and soul that it does not now possess; it would make it more attractive to young and old. This to my mind is an exact case in point—few can find fault with the thorough and business-like way in which

THE GREAT AND EXCELLENT WORK OF THE INSTITUTE

is carried out; but no one will suggest that its social qualities as a body, almost exclusively confined as they are to a guinea-and-half annual dinner, are such as to inspire fraternal feelings in the bosom of the most warm-hearted artist. But in the Architectural Association one of our greatest aims is to encourage that social intercourse which is so valuable, and that strong feeling of fraternity that should exist among all true artists. In a limited way our annual excursion helps to create, extend, and foster that warm feeling of brotherly equality in art. One episode in the last excursion was the admiration called forth by Nesfield's work at Hampton-in-Arden, Warwickshire—and especially his careful

RESTORATION OF THE VILLAGE CHURCH.

Here I felt, and I think we all felt a touch of brotherly kinship for the artist, of whom it may truly be said, "though dead, he still speaketh." May the works that we carry out speak in the same language to future generations; and here I cannot help referring to the loss we in common with the whole art world have sustained by the death of Sir Edward Burne-Jones. If there was any one artist more than another who entered soul and spirit in the greatness of his art, where highest aims were purity, and poetic ideals, whose work has influenced the whole world of art, and the result of whose influence and example will live on for generations to come, that artist was Burne-Jones. Such a life and such art as his must mark him out as the artist among artists of the nineteenth century. In speaking of painters generally, one could wish that they, as a body, could enter more into the art side of Architecture than they do. Of course, there are many exceptions, but, as a body, I do not think it can be said that they really appreciate Architecture, and certainly very few take any trouble to learn the

GUIDING PRINCIPLES OF OUR ART.

The more they do so, the more will architects be able to enter into their feelings, with results that cannot help being mutually beneficial in case of decorative work. Undoubtedly we, as architects, have many bad art traditions to unlearn, and much more that is good to learn. We are much too apt to accept the shoddy decorator's bad copies of ill-drawn mediæval work, and seek to obtain quantity instead of quality. It is only the drawing together of architects, artists, and sculptors in mutual intercourse, and the exchange of ideas, that will help to break down the ignorance that exists on both sides, and bring about the harmonious results to be desired. This mutual understanding is equally, if not even more, necessary between the architect and the stained glass artist. On the one side, how many buildings have been

RUINED BY THE STAINED GLASS

put into the windows, owing to the entire want of sympathy on the part of the artist with architectural surroundings; and, on the other hand, it not unfrequently happens that the artist is trammelled by the requirements of an architect who knows little or nothing of the correct treatment of glass, and seeks rather to obtain a series of copies of pictures in glass than a glass picture. The employers are, of course, often to blame for these incongruous results. Their estimate of the duties and capabilities of architects is often, and not without cause, a very limited one. That the architect's artistic powers should extend beyond the limits of bricks and mortar, drains, and ventilation does not occur to many.

On the other hand, their views of an artist's power, simply from the fact that he is called an artist, is sometimes extensive, and they would deliver the work of decoration of a building or the stained windows into their hands without for a moment thinking whether such artist has any sympathy with Architecture, and without realising that the whole architectural proportions and effect may be simply ruined by

THE MISAPPLICATION OF COLOUR DECORATION

and ill-chosen glass. An amusing instance of how extensive the powers of an artist are considered to be occurred to my brother who, when considering the scheme for the mural decorations in one of my churches, was asked mysteriously by the churchwarden if he could consult him on a small matter of business. "The truth is," he said, "I have a friend who has a false nose, and he wants it painted. Will you kindly undertake the job?" But whatever our powers, be they limited or extensive, do let us as a body try our best to get in touch with artists and craftsmen of all kinds, and then I feel sure that those whose work is worth having will gladly meet us half way to our mutual benefit. In drawing to the close of an address of this kind, one feels how much there is that might be said with advantage on many points that there is no time even to touch upon, and how many things one ought to have said, that have been omitted. But please forgive such omissions, and although what I have said may at times have seemed, as before hinted, somewhat

SEVERELY PRACTICAL,

I trust you will believe that the sentiments therein expressed are sincere. Let my last words be to remind you that as architects our responsibilities are as great as our work is noble, and the growing appreciation of what is beautiful, and what is highest and truest in our art, within our ranks, if we are true to ourselves, cannot but make its influence felt in the outside world. Great as has been the advance in our art during the last 60 years, yet Architecture as an art is at the end of the 19th century only beginning to be recognised as such, by people at large. Officially, the best representatives of our art, the men who are entrusted with the building up of the nation's monuments of peace and posterity, remain unrecognised and unrewarded. A great, free, and enlightened daily press as yet treats Architecture with comparative indifference, and from simple want of appreciation of the work involved in the design for any great building, in many cases

CONSIGNS THE NAME OF AN ARCHITECT TO OBLIVION.

For some of this indifference, and want of public acknowledgment, we, as a Profession, have in a measure ourselves to blame. When people have forced upon them such buildings as have lately been allowed to disfigure such sites as the Embankment, near Somerset House, and Victoria Street, Westminster; and when buildings that have been erected at great cost have, from time to time, to be condemned as unsafe through structural defects, it is no wonder that they cry out:—Where is the art and science in Architecture? It is the object of improving matters that forms the very *raison d'être* of our Association. But we must also remember that however much we may value the appreciation of others, our art, as such, is in no way dependent upon public appreciation, which as all know is a fickle quantity. The highest art is the true reflex of the inner man. Let your work be truly your own work in every sense of the word,

STAMPED INDELIBLY WITH YOUR OWN INDIVIDUALITY.

It is by such work you will make your "little best" strengthen the great whole, and advance our art. We architects are the writers of a nation's history in stone, brick, mortar, and metal. It is our work that will speak of the nobility and greatness, or weakness and depravity, the richness or poverty of a nation. Think of the history that is recorded to us by the great architectural works of Egypt, India, Athens, or Rome—think again, how accurately the work of the early and mediæval times describes the character of men then living.

Surely an art such as this is worth living and working for. To us in a great measure is entrusted the comfort and health of the community, to us the raising of great municipal and national monuments, and last but not least, to us is given the honour of designing churches for the worship of the Great Architect of the Universe, buildings that will each in their own way, in the future, influence men for good or for ill, as the buildings of our forefathers have influenced our own. For students, let my last words be those of Bacon: "Our studies serve for delight, for ornament, and for ability."

Mr. H. H. Statham proposed a vote of thanks to the President for what he described as one of the best written and most comprehensive addresses delivered from the presidential chair of the A.A. Commenting on the transference of subjects from Division II. to Division I., Mr. Statham thought that the proper object of the first division should be the elementary instruction in the sciences which bore upon Architecture, and in the second division the instruction should deal with special problems upon construction—therefore, he approved of the re-arrangement. The general history lectures ought always to have been in the first division. Surveying, which had now been made an extra subject, ought never to have been in the first division; it was rightly placed as an extra subject, for it was not a necessary part of architectural practice. Nevertheless, he would urge young men not to exclude this subject, for its value was very considerable. The speaker also seconded the President in his view of the importance of demonstration classes and workshops. He thought the President was quite right in what he had said as to the undesirability of apprenticing young architects in a builder's yard. For an architect who was to use his pencil to a certain extent, apprenticeship in a builder's yard was too rough. He agreed *in toto* with the President when he said the examinations of the Institute were not an end in themselves. They had no doubt been of great use in encouraging architectural students in the pursuit of practical and scientific knowledge, and that, he thought, was their real and only proper object. The studio was the most important branch of the work of the Association. Architecture was an intellectual conception, and a man could not make a satisfactory intellectual conception of the whole building if he had to divide his thoughts between carving, moulding, and every little part, at the same time making himself a practical mason or carver. The speaker countenanced the social side of the work of the Association, but asked whether the music-hall element was necessary at the smoking concerts. Was it not possible for a company of artists to amuse themselves artistically in a refined way?—Mr. Beresford Pite, in seconding the vote of thanks, said that

THE INFLUENCE OF ASSOCIATION

amongst them upon their educational work must never be overlooked. He referred to the modifications which had been made in the examination scheme, and said he sincerely hoped that further modifications would yet be made. He hoped they would get away from their history books, and learn to look at Architecture for themselves. An architect could not design in a material the nature of which he is unacquainted with; but if it were necessary for a man, in order to design, say, fine iron work, to hammer it out with his own hands, that man must be content to die and be re-incarnated two centuries ago, where he would be brought up at the feet of that race of born smiths, who created the ironwork of the early and later Renaissance.—The vote of thanks was supported by Mr. Edwin T. Hall. He deprecated the proposal of students working in workshops. A young student's hand would soon become unfitted for pencil work if he used a mason's hammer or other tools. He very much doubted if any of the great artists of the past went through such a course of study at all. Besides, to do all this, a student needed to live two or three lives. He thoroughly agreed as to the value of the social side of the work of the Association, but he was with Mr. Statham in objecting to the

introduction of the music-hall element in the smoking concerts.—Some further comments were added by Mr. A. Cole Adams, Mr. Walter Millard, and Mr. Seth-Smith, after which the vote of thanks to the President was unanimously carried.—In responding, Mr. Prynne said that during his term of office he would do his "little best" for the advancement of their great Art.

Before the delivery of Mr. Fellowes Prynne's address at the inaugural meeting of the A.A., several business items were disposed of, including the adoption of the annual report and balance sheet. This was moved by Mr. Hampton W. Pratt, who mentioned that the membership of the Association at the end of the session was the largest they had ever had. The educational work of the Association had been well maintained during the last session, although there had been a slight falling off in the number of students. On the whole the work done was very good and encouraging. A source of great dissatisfaction to the committee was the fewness of the students who had passed into the advanced division, and alterations had been made in the curriculum which the committee trusted would have the effect of increasing the attendance in Division I., while causing no falling off in Division II. The studio and the school of design had been carried on successfully, and the speaker paid a tribute to Mr. Lewis, who he said had worked so ardently in advancing the interests of the studio. Coming to the balance sheet, a very satisfactory condition of affairs was revealed. There exceeded a balance on the right side of £150. The subscriptions were slightly in excess of the previous year in consequence of the larger membership, but, on the other hand, the arrears of membership were also larger.—Mr. W. W. Seth-Smith, in seconding the adoption of the annual report, said it was a sad fact that the attendances in the higher division of the curriculum were unsatisfactory. If the Profession realised more fully what Professor Roger Smith had recently pointed out, that the Association was founded and maintained to encourage the training of bonâ-fide architects—men who were able to afford the advantages of pupilage and go through a course of regular training—their classes would not suffer through lack of members. The Architectural Association did not pretend to compete in the matter of fees with the polytechnics or the

SO-CALLED SCHOOLS OF DESIGN,

in which a number of men of various trades, especially the building trades, went through what was called an architectural course. The Association was particularly for the architectural pupil, and if the principals would bear that in mind and urge that point upon students who could afford these privileges, he felt sure that even in the higher division of the curriculum they would not suffer from lack of members.—Mr. Owen Fleming put the following three questions, of which he had previously given notice to the President:—

1. Were the Committee yet in a position to make any definite statement as to the probable locality of the proposed new premises?

2. Were any, and, if so, what provisions to be made in the new premises for the adequate training of students in the scientific handling of materials?

3. Whether it was the intention of the Committee to obtain the approval of the general body before committing the Association to any particular scheme?

The President answered the first question in the negative, and said that Mr. Fleming's other questions were answered in the Presidential address.—The other business at the meeting included a vote of thanks to the hon. auditors, Messrs. H. P. G. Maule and G. W. Stonhold. A number of old-time members were reinstated, and a long list of nominations was read. Following these came the presentation of prizes, medals, and certificates gained during the last session, and afterwards the President's address.

At Cookham, near Maidenhead, a large working-men's institute has been opened.

AN ENORMOUS . . . AGGREGATION OF .

Architectural Articles.

Important Announcement

- - in regard to - -

"THE BUILDERS' JOURNAL."

"The Builders' Journal and Architectural Record" is admittedly the best and brightest weekly paper published for the Architectural Profession and the Building and Allied Trades.

Upon repeated occasions the bulk of the "Journal" has been increased.

It is now the intention of the Editor to enhance the authority, artistic quality, and literary and technical excellence of the "Journal."

The pages of "The Architectural Review" cannot adequately cope with the number of authoritative and excellent articles offered from time to time, and the Editor of "The Builders Journal" has now arranged to take a selection from such articles for insertion in the "Journal." Thus, while "The Architectural Review" will deal with Art subjects of enduring character and undoubted influence, "The Builders' Journal" will publish the more controversial and currently critical subjects offered for consideration.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

October 19th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

ONE of the few remaining landmarks in Whitehall has just recently passed out of existence. This was Vanbrugh House in Whitehall Yard, which was built by Sir John Vanbrugh in 1796. Prior to 1831, it was the residence of Lord Stuart de Rothesay, but in that year it was taken over by the then recently established United Service Institution, which, together with its famous museum of naval and military relics, was housed there until 1895, when the Queen granted the use of the historic banqueting house of the Palace of Whitehall. The old building, which stands on the site of the quarters allotted to the officers of the Jewel House, has now been demolished to make room for the erection of the new War Office on ground formerly occupied by Carrington House.

THE universal rush of the present day did not always exist. Men used to take their time in completing any important undertaking they might be engaged in. This is especially true of the building of cathedrals. For example, the inauguration of Bristol Cathedral was due to Abbot Knowle, by whom its erection was begun in 1306; but it was 582 years later, in 1888, before it was out of the builders' hands. Gloucester witnessed in 1089 the laying of the foundations of its cathedral, but it was destined that sixteenth century eyes should be the first to gaze upon the completed pile, for it was finished in 1514, 425 years from its commencement. Just 535 years back, on July 19th, 1361, an interesting ceremony transpired in the City of York. Archbishop Thoresby then laid the foundation stone of the cathedral choir. The church itself occupied the time of the builders for 301 years, 1171 to 1472.

MR. F. HERBERT MANSFORD writes, in reference to City churches:—"Artists and architectural students would be grateful to be able more easily to use the buildings as subjects for sketching. At present, permission must almost always be obtained from the incumbent, who frequently lives at a distance, or who (if near) may be absent from home. Such permission is generally very courteously granted, but on entering one of the City churches on Saturday afternoon the verger informed me that the permits were only for a single occasion, and that mine was no longer valid. Sometimes a charge is made for a permit lasting one month. On one occasion I paid 2s. 6d. for such a privilege (including the use of the camera), but never found a second opportunity of utilising it. It would be a boon if some particulars as to sketching, &c., were placed on the notice-boards, whence they could be listed by such bodies as the Architectural Association and sketching clubs. Would it

not be practicable to allow sketching freely when no services are being conducted, and to grant permits only for measuring, brass-rubbing, and photography? Such a privilege would be widely appreciated, and clergymen would be less frequently troubled by applications. There are two or three churches, such as St. Bartholomew the Great, where the numbers of students might cause inconvenience, and in such cases the charge is a protection to all concerned, and a real source of revenue. Artists and architects often have some influence when the demolition of a church is under discussion, and it is much more likely to be used when the edifice has been fully appreciated by that intimate knowledge of its detail which is acquired by sketching."

SOME of the greatest buildings in the world derive their chief interest from the circumstance that they were never finished, or have become picturesque ruins, like the score or so of castles on the Rhine. Most people will be gratified to hear that the Watkin Tower in Wembley Park is to be added to the number. Silly emulation of the Eiffel Tower was responsible for the enterprise, which has cost £100,000, and has just been sold to the ground landlord for less than half that sum. The meaningless monstrosity will stop at the first floor, and, to that extent, will be a more trifling disfigurement than if it had shot up a thousand feet, which was the original intention.

RUMOURS that the dome of the Oratory, which overshadows Brompton, was about to subside, has caused alarm in the neighbourhood. Countenance to the truth of these rumours has been given by the appearance of scaffolding round the large gilt cross that surmounts the dome. The scaffold round the cross was due to the rod which bears it, and which is fastened into a beam, having bent slightly. The rod and its fixings are now being repaired and straightened. With the fabric itself there is nothing wrong. A fully qualified engineer had been deputed by the London County Council to examine it; he pronounced it absolutely secure. Seen from certain places in some lights the dome has the appearance of a leaning dome. This, however, is an optical illusion. The Oratory, is now, to all intents and purposes, finished. To complete the original design two large towers should be added to the façade. The platforms for them are already built. The erection of these towers will cost something like £15,000. There are many other works in connection with the Oratory far more pressing than the erection of the towers. Besides, it is held by not a few that they are not wanted. They will crowd the building too much and dwarf the beautiful dome.

"C. F. M." writes: "May I trespass upon your space to call attention to a very serious inconvenience that the riders in cabs and the drivers of vehicles are now suffering through the partial watering of the wooden pavements? At present the water carts only water each side of the roadway where it slopes down to the gutter. In consequence of the road being now very dusty, watering makes the surface into a greasy, slippery mud, upon which it is almost impossible for horses to keep their feet. If it is the object of the County Council to save water at the present time, it would be far better for the cab horses and the nerves of the passengers if the wood pavements were not watered at all."

PADDINGTON is the latest London district to resolve upon building a great town hall. The existing offices, which stand in the Harrow Road, near Paddington Green, have been found too small for modern requirements, and are consequently to be demolished. It is proposed to erect the new buildings as an exact copy of the Portsmouth Town Hall, an imposing edifice in a classic convention with a lofty colonnade and tall central tower, finished some ten years since. The Portsmouth Town Hall, however, it is curious to observe, was in its turn a replica of that of Bolton, Lancashire,

which can also claim to be the parent of the Town Hall of Leeds. There may possibly even be other copies of that evidently much-admired design, which opens up a prospect of a dreadful sameness among the municipal buildings of the land; just as Londoners, journeying over the length and breadth of the country, are pursued from town to town by the "Westminster chimes."

THE exhibition of Rembrandt etchings and drawings now in preparation at the British Museum will, it is hoped, be ready before the end of November. The present show of drawings by the old masters—of which the principal feature is the Malcolm collection—will be removed. The Museum contains what is, on the whole, the richest collection of Rembrandt's etchings in Europe, numbering about sixty or seventy examples. There are also nearly 400 original drawings. The whole will be arranged chronologically, as far as possible, for the benefit of students. None of these have found their way to Amsterdam, the Museum authorities having no statutory powers to remove the exhibits for loan purposes. In addition to the Rembrandts there will be a supplementary exhibition of other art works, the particulars of which are not yet known.

MR. CLAUDE HAYES, R.I., dubs the water-colour drawings on view at the Clifford Gallery, 21, Haymarket, as "of East Anglia." The majority are so, but here and there will be found a bit of Surrey, a Sussex haymaking, or even a fair bevy of Dutch maidens. Mr. Claude Hayes has never been wedded to a groove, but when he has used figure it has generally been incidental rather than of primary importance, and of such delicate finish as in "By the Stream." Perhaps the most noticeable point in his broadly but not sloppily touched landscapes, next to their weatherliness, is the extraordinary realisation of mileage. He differentiates class of ground well. How faithfully is the spongy nature of marsh land given in No. 9, and the rustling of the dead rushes. "In the Berkshire Meads," and the dry quality of heathered moor in more than one spacious landscape that is present. Neither David Cox, nor Thomas Collier, nor De Wint are imitated, and yet there are drawings present which call up memories of all three masters. Possibly De Wint is most seen in the skies, and this in clouds of a dun tone that is suggestive of faded pigments. These are less admirable than the skies of "A Storm near Beccles," with its fleeting cloud shadows, or the finely treated sky above leagues of level land bounded by low hill, "Near St. Olaves." It is a worthy little show, fresh and unaffected, although these are no new virtues, in the artistically rendered pure landscapes, landscape with animals or figure, and the more restricted compositions of picturesque mills, farms, bridges, &c.

OUR towns are always much concerned about street paving. There are many competing systems—wood, asphalt, concrete, and granite blocks. It is of interest, therefore, to record that granite sets, considered the most durable, as they are certainly the most noise-producing system of paving, have been renounced by the Granite City—Aberdeen. Up to now the city has stuck to its native stone and its local industry, but it was induced to try tar macadam. The result is that granite is given up, as tar macadam is found to be as firm as granite and does not cause noise and irritation. Since it has been adopted in Aberdeen it may perhaps also be taken for granted that tar macadam is cheaper.

ARCHBISHOP LAUD's connection with Gray's Inn has been fittingly commemorated by the addition to the chapel of a stained-glass window, which has just been dedicated by the Bishop of London. The memorial fills the south light of the east window, and in treatment harmonises well with that of the north, in which Thomas a Becket is the central figure. Laud is depicted in full episcopal robes, with an open book of prayer in one hand and the pastoral crozier in the other.

At the base is a small representation of the Archbishop upon the scaffold, with the Tower of London in the background.

TIME was—and that not so many years ago—when the streets of New York were unrivalled for their bad paving and dirt. Now they may stand as a pattern to London, and notably in their maintenance. Quite recently the authorities had to face the problem of providing ten miles of streets with the underground trolley system with as much rapidity and as little inconvenience to the public as possible. In a period of thirty days the most difficult part of the work was done. In order to achieve this result, however, labour was not employed in our piecemeal fashion, but a daily average of 7000 men was engaged. The work was continued day and night, and the ordinary traffic was not interrupted, while the cost will be no more than if the work had been done by small relays of men.

THE difficulties which the London County Council have experienced in arranging housing accommodation for the people who will be displaced by the Clare Market scheme and the proposed new street to Holborn have been lessened somewhat by the willingness of the Duke of Bedford to sell two sites in Drury Lane and a larger site fronting Herbrand Street, near Woburn Place. A joint report of the Housing of the Working Classes and the Improvements of the London County Council recommends that these sites be purchased at a cost of £118,740, the Duke in part consideration being allowed to purchase at £13 4s. per foot a strip of ground which will front a portion of the western horn of the crescent which it is proposed to form at the southern end of the new main street.

THE old Dutch masters found their motives and subjects at their front doors. Comparatively few of them went travelling beyond their own country, sometimes hardly beyond their own town. You do not hear of Rembrandt in Italy or Spain, nor of Franz Hals in England. The modern Dutch painters, as far as motives go, have accepted the old traditions, and have stayed at home and painted the landscape and Architecture and people they know best. And probably by not allowing themselves to be puzzled by unfamiliar problems of light and atmosphere and character, as well as by borrowing judiciously from the methods of the modern French masters, they have evolved a convention or style which makes their work always agreeable, even when it is not great. Monotony is the fault we have at times had to point out in the pictures of James Maris and Mauve; it takes a Rembrandt or a Velasquez to repeat the same theme with endless variety. It may therefore sound something like a contradiction if we say we wish there was greater monotony in the work of Tholen, who has just opened an exhibition of paintings and watercolours at the Goupil Gallery.

LIKE Maris and Mauve, he finds, as a rule, all that he wants to paint in Holland. There are one or two Bavarian motives in the collection; the others are all Dutch. But, unlike Maris and Mauve, he seems still uncertain of the formula by which he would express them. Some canvases are as full of detail as a photograph, some are treated with the breadth characteristic of the methods of the two painters we have just named. This uncertainty gives an effect of weakness to many of his pictures; they have little of the style or distinction we usually look for in modern Dutch work, though there are not many English landscape painters to-day who could make as interesting an exhibition. Tholen is really best when he is most like Maris, as in the watercolour at Enkhuizen, with its wet, cloud-swept sky, or suggestive of Mauve as in the colour scheme of the "Scheveningen: End of the Season," also a watercolour, the grey sands and grey skies and grey boats of Holland in her saddest mood. And there are paintings in which the subject alone has a charm that cannot easily be destroyed: for

example, the "Castle in Holland," the old brick mansion rising from its moat with beyond just a suggestion of the barren, rain-sodden plain, to which it gives colour and beauty and romance.

MR. CLAUDE HAYES, whose canvases are now to be seen at Clifford's Galleries, has been working in that part of England which is most like Holland—in the Norfolk Broads; where, too, you look across the wide plain to the low horizon, where you see the great sails of invisible boats gliding through the fields, and where windmills turn their giant arms above the marshes. In England, however, it is not so easy to be faithful to tradition as in Holland; there are so many and conflicting tendencies that the painter is lost in bewilderment, and unless he has in them that right instinct—we say nothing of genius—that sends him straight to what is really good and really great, to what, in a word, is Art, it is no wonder that he should spend years stumbling in his search of the one guide worth following. In Mr. Hayes' work we are a little too conscious of the tradition of the Institute, which no one can say has as yet led to the masterpiece. He usually chooses his subjects well; they are just those in which the Broads are richest. But his foregrounds are niggled, too full of meaningless detail; there is no movement and little modelling in the clouds that cover his sky; he looks at Nature with too literal eyes to see the pictures she may suggest. It is when he breaks loose from Institute ways and methods that he is really most pleasing. There are some little studies made near Walberswick and Dunwich—old haunts of Charles Keene—in which he seems to have forgotten the Institute formula, and been content, instead, to note simply the delightful colour scheme made by the grey sands, the red roofs, and blue water. And it is curious that in these studies, where he has just washed over his sky, he expresses space and air far better than in more elaborate drawings.

THE Battersea Vestry recently voted a sum of £400 for the erection of a refreshment kiosk in the parish cemetery. The building is being erected with all possible speed, and it will probably be ready for use in the early spring. Never before has such a novelty as a restaurant in a burial ground been attempted in England, and it is only the particular bleak and isolated position of this cemetery which has brought about the necessity for such an erection. This novel refreshment kiosk will consist of two rooms. In the outer room there will be a stove and five dining tables. Externally the building will be of red brick with stone dressings, and it will be roofed with red tiles, like a cottage. The aim of the builder will be to keep the whole building in harmony with the general Architecture of the two cemetery chapels which it faces. It will be situated upon a small mound in the centre of the grounds. The internal decorations will be carried out in stained deal.

THE City authorities have in contemplation an important street improvement which, if carried into effect, will revolutionise to some extent the traffic in St. Paul's Churchyard. The proposal is that the north side of the cathedral—a narrow and deceptive *cul-de-sac*—should be opened up for vehicular traffic. At the present moment, and for years past, this place has been known among drivers as the "spot barred," because, as a matter of fact, while it is a most desirable spot for entry and egress, it is religiously barred by an ancient gateway, over which the ecclesiastical authorities keep strict watch and ward. The scheme includes the setting back of the large shops facing the north side of the churchyard, the slicing off of a portion of the cathedral palings near the western entrance, and the removal of a piece of projecting property at the top of Ludgate Hill. The result would be a straight line of street from the top of Cheapside into Ludgate Hill; but the cathedral authorities are not disposed at present to open the obstructing gate, and it remains to be seen whether the City Corporation will find a key to open it.

THE OFFICE OF WORKS.

SOME BUILDING SCHEMES IT HAS LONG DEFERRED.

IN Pall Mall there are a lot of dilapidated-looking old houses. With passages made here, holes pierced in its worm-eaten walls there, and with a sentry-box near its front door, it became, some twenty years ago, the War Office. It has remained the War Office ever since, and is, as it then was, a disgrace to Her Majesty's Office of Works. It had, and has, no proper convenience for the conduct of the business of a great machine. A new War Office has been promised. When it will be ready is another matter. Not one brick has yet been laid upon the site selected for it opposite the Horse Guards. Yet several years have passed since the Office of Works pulled down the magnificent mansion of the Carrington family to make room for this new War Office of theirs. It need hardly be said that

CARRINGTON HOUSE

was a very commodious building, in most excellent condition. A few alterations at very slight cost would have made it a useful centre for the housing of the overflow of the many departments, to find places for which has for many years cost immense sums of money. If the Office of Works knew that ten years would elapse before the Carrington House site could be made use of, why was that house pulled down, and a mass of bricks left to disgrace and be an eyesore in what is one of our few fine thoroughfares? Again the Office of Works has acquired the Parliament Street and King Street sites for the purpose of erecting thereon a new building which is, it is believed, sometime or other, to house the Local Government Board, the Education Department, the Science and Art Department, and the Board of Trade. Three-fourths of the houses in Parliament Street, on its western side, have been pulled down for several months. The former occupants of them—civil engineers, surveyors, Parliamentary agents, and others—begged the Office of Works to be allowed to remain as monthly or even weekly tenants until the whole of the houses to be acquired could be pulled down straight off. But the Office of Works sternly refused to consider these proposals. They must, or should, have known that obstacles and delays would occur in the acquisition of all these houses. As matters stand the important corner building is still unacquired owing to

A QUESTION OF COMPENSATION,

and the King Street Post-office still stands supported by much shoring, while the clerks and telegraphists are wondering how much longer they have to live. While, then, these two places remain unacquired a large sum of money is being lost in rents, and many civil engineers, Parliamentary agents, and others have no places to go to. In short, says the Daily Mail, this Parliament Street business is almost the biggest blunder ever perpetrated by the Office of Works, and it will be more than a matter of surprise if, in the next session of Parliament, searching enquiries are not made into the history of it all. In fact, the time has, in the opinion of many, arrived for a Parliamentary inquiry into the work of the Office of Works. A flood of light might then be thrown on (1) the rents paid for "temporary" accommodation for the various Government offices in and about Whitehall; and (2) the loss which has accrued to the Treasury from the disuse of lands which have long been bought for public buildings. The site in Charles Street, behind King Street, was acquired upwards of thirty years ago at immense expense. On that part of it not occupied by the celebrated iron building there lies a congested heap of rubbish. How much longer will it remain there?

THE lectures at King's College on "The History of Architecture" take place on Wednesday evenings at seven o'clock punctually. We may mention that the lectures are treated with a view to explain the principles of design, and are not, therefore, merely historical.

Professional Items.

ABERCYNON.—Abercynon has just provided itself with a prettily situated church, known as St. Donat's, Abercynon. The building comprises a fine chancel, nave, south aisle, and western gallery. The church is lined throughout internally with red Cattybrook bricks. The external dressings are of red Cattybrook bricks, with the exception of the east and west windows and buttress weatherings, which are of hard Douling stone. The architect is Mr. G. E. Halliday, F.R.I.B.A., diocesan surveyor, and the contractor is Mr. Games, of Abercynon.

BARRY.—The Barry School Board has recently opened an infants' school on Barry Island. The school is built of red brick with Forest stone dressings, and consists of two school rooms divided by a movable partition, two class rooms, babies' room, and cloak room, &c., the accommodation being for 288. A special feature has been made of the arrangements for ventilation and heating, as the Board wished to secure the greatest possible hygienic results, and upon the recommendation of the architect they decided to adopt mechanical means on the plenum system as being the most efficacious to secure thorough ventilation throughout both summer and winter. The results have fully justified this decision. A brief description of the heating and ventilating apparatus may be given. The plant is fixed in a roomy basement under the cloak room, and comprises a powerful heater, fan, and a gas engine for driving the latter. The air is filtered before passing through the fan so as to remove all impurities; it is then forced over and around the heater, and then along glazed earthenware flues to the different points as required. The fresh, pure air which is heated in the winter and is cool in the summer is delivered through ornamental register gratings overhead into the various rooms, and after making a circuit of same, takes its exit through extractors near the floor; thus, any portion becoming vitiated is at once removed from the rooms. A series of exhaustive trials has shown that the results are highly successful, the air, after being admitted, being thoroughly diffused without any perceptible draught, although in some instances the entire volume in a room is changed once in about ten minutes. The installation, although exceedingly simple, is very complete in every respect, and provision has been made for its extension to the further block of school buildings which the Board contemplate erecting. A very noticeable feature is the agreeable nature and purity of the air, as, although ordinary fresh-air inlets and fanlights are provided, to be used in case of necessity, the teachers prefer to have them all closed, as they fully consider, after testing the system, that the filtered air as delivered by the fan is far more agreeable and pure than that coming in by the ordinary inlets. The whole of the work has been carried out under superintendence of the architect, Mr. G. A. Birkenhead, of Cardiff; the heating and ventilating apparatus has been laid down by Messrs. Musgrave and Co., of Belfast; and the contractor for the building was Mr. J. Lewis, of Cadoxton-Barry.

CARDIGAN.—The new buildings provided for the Joint County School at Cardigan are now in use. The site of the new school is two acres in extent, enabling the managers to provide excellent playgrounds and covered rooms for exercises, with the remainder for extending the accommodation whenever found necessary. The building, which has a commanding frontage, with a green in front, and standing back some distance from the main road, is constructed of fine brick, with Bath stone dressing. The building contains a spacious assembly hall, class-rooms, lecture-room, laboratory, cookery-room, laundry, workshop, lavatories, &c. The architects were Messrs. Morgan and Son, Carmarthen, and the contractors Messrs. J. Williams and Son, Felinunillo. The estimated cost of the buildings, irrespective of the site, is £3500.

DUNDEE.—The memorial stone of Park United Presbyterian Church, which is being built in Park Avenue, Dundee, was laid a few days ago. The church, in which accommodation will be provided for 750 persons, occupies a site at the junction of Park Avenue and Morgan Street. The contractors for the work are:—Builder, Mr. William Bennet; joiners, Messrs. J. F. Shaw and Son; plumbers, Messrs. Mitchell and Son, Dundee; slater, Mr. William Brand, Arbroath; plasterers, Messrs. Reoch and Kilgour, Dundee; glaziers, Messrs. Lindsay and Scott; and heating, Mr. David Keay. Mr. Charles Soutar, of Messrs. C. and L. Ower, is acting as assistant in charge of the work. The plans were prepared by Mr. Leslie Ower, of Messrs. C. and L. Ower, architects, Dundee. The estimated cost of the building is £3000.

MACCLESFIELD.—The Duke of Westminster has laid the foundation-stone of the restored Macclesfield parish church. The church was founded in 1278 by Queen Eleanor, wife of Edward I., who visited it on the occasion of its foundation. The church was rebuilt in 1470, and so it has remained up to the present time, with the exception of the addition of a chancel in 1813, and another chancel in 1863. The present restoration, which is an entire one, is being carried out at a cost of about £15,000. Sir Arthur Blomfield, A.R.A., is the architect, and the work is being carried out by Mr. J. Thompson, of Peterborough.

MANCHESTER.—The memorial-stone of the new Welsh church, dedicated to St. David, which is in course of erection in Lime Grove, Oxford Street, Manchester, has been laid recently. The plans have been prepared by Messrs. Preston and Vaughan, architects, Diocesan Chambers. The style of Architecture adopted is Early Perpendicular, and the materials employed are red brick, with Ruabon terra-cotta dressings. The plans include nave and aisles, with chancel and vestries on the south side. The church will accommodate some 400 persons. The builder is Mr. R. Carlyle, jun., Ardwick.

NEWCASTLE-ON-TYNE.—The Victoria Branch Library in the Heaton Park, Newcastle, was recently opened by Earl Grey. The general contractors have been Messrs. J. and W. Lowry; Mr. Mansfield Gibson, plumbing; Mr. John Hewitson, tiling; Mr. G. J. Baguley, lead glazing; Mr. N. F. Ramsey, locks and hardware; Messrs. Doulton and Co., sanitary fittings; Messrs. Ashwell and Nesbit, heating apparatus; and Mr. Robert Beall, carving and marble work. The Corlett Electrical Engineering Co. will carry out the electric light installation. The whole of the works have been carried out from the designs and under the superintendence of Mr. John W. Dyson, architect, Newcastle-on-Tyne.

ST. ANNES-ON-THE-SEA.—The work in connection with the new church has been let to Messrs. Smith Bros., Burnley; Messrs. J. Hatch and Sons, Lancaster; Messrs. T. Cross and Sons, Lancaster; Messrs. Braithwaite and Co., Leeds, as mason, joiner, tiler, and plumber and glazier, respectively. The church is to be built of brick, with red stone dressings, at a cost of about £5000. Messrs. Austin and Paley, of Lancaster, are the architects.

SMALL HEATH.—A new church has been erected at Waverley Road, Small Heath, under the auspices of the Unitarian community. The style of the edifice is simple Gothic. The surmounting of the building with a tower and spire, and the erection of schools, are portions of the scheme which for the present are deferred. The structure has involved an outlay of £2700, exclusive of the cost of the site. The new fabric was designed by Messrs. H. Eachus and J. A. Grew, and the contractor was Mr. B. Whitehouse.

SOWERBY BRIDGE.—The new Sunday school erected in connection with West End Congregational chapel, at a cost (including furnishing) of about £2750 exclusive of land, was opened on Saturday week. The accommoda-

tion provided includes an assembly hall with a balcony on three sides capable of seating 600 persons, with thirteen vestries, minister's vestry, and a kitchen divided from the children's class-room by Peace and Norquoy's patent folding partition. The architect for the school was Mr. S. Wilkinson, of Sowerby Bridge.

TUNBRIDGE WELLS.—New swimming baths have been opened at Tunbridge Wells. Briefly stated, the accommodation is as follows:—Ladies' department, two first and four second-class slipper baths. Gentlemen's department, four first and six second-class slipper baths. The baths are of porcelain, the bath-rooms and passages have mosaic floors, and pitch pine partitions, and will be warmed by means of steam radiators. They are lighted and ventilated by skylights and lanterns in the roof. The swimming bath has a water area of 90ft. by 35ft., and is 6ft. 6in. deep at the deep end, and 3ft. 6in. at the shallow end. The bath is formed entirely of concrete, with walls lined with white glazed bricks, and bottom paved with white marble mosaic. The walls, for a height of 8ft., are lined with cream glazed bricks, with chocolate bands, and above that level with red bricks. The footways are all of coloured marble mosaic. The roof, which is 55ft. span, and 40ft. high from floor to apex of lantern, was constructed by Messrs. Main, of Glasgow. The Borough Surveyor has been the architect of the new baths. A system of subways give access to all pipes and drains without breaking the floors for purposes of future inspection. The electric light from the borough works supply will be used in all departments of the baths, which have cost £10,000, and will rank with not a few of the best erections of the kind in England. Messrs. Longley and Co., of Crawley, are the contractors, and Messrs. Bradford, of Salford, have done the engineering work.

WEST HAM.—Mr. J. Passmore Edwards has just opened the new Technical Institute and Central Free Public Library erected by the West Ham Corporation. He also laid the foundation stone of a natural history museum which will be built close by. The new buildings, which stand at the corner of Romford Road and Water Lane, Stratford, are in the form of a large quadrangle. The Technical Institute has its main front and entrance in the Romford Road, its upper floor extending over the library premises in Water Lane. It is in a free Renaissance style, the exterior being of Portland stone and red brick. The design of the interior is throughout utilitarian. In the large hall lectures will be given and examinations held. The hall may be let for purposes which will not interfere with the work of the Institute. Every department is well equipped, special attention being paid to the chemical laboratories and the engineering workshops. The buildings have cost £450,000, and a further £15,000 has been spent on equipment and fittings. The new central library is wholly on the ground floor, and is fitted with all the modern appliances of such institutions. The reading room is 110ft. long by 30ft. wide. It is surrounded with a tiled dado embellished with literary maxims in an ornamental border. The cost of the building has been between £8000 and £9000, and about £4000 has been spent on the furniture and fittings. The whole of the buildings will be lighted by electricity supplied from the Corporation mains.

WREXHAM.—The new Penybryn Congregational chapel, Wrexham, has been opened for public worship. The new buildings, comprising a church and school accommodation, occupy a commanding site at the junction of Salisbury and Percy Roads. The schoolroom provides accommodation for 300 scholars, and adjoining are three convenient class rooms. The church seats about 500. An apse is provided at the end, in which will be placed the organ. The choir seats are arranged at the front of the pulpit. There are ministers' and deacons' vestries and a kitchen. The buildings are of simple Gothic design, faced with Ruabon brick and stone dressings. A staircase tower is provided in the west angle surmounted by a turret.

Enquiry Department.

THE INSTITUTE EXAMINATIONS AGAIN.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Will you kindly inform me, through your "Enquiry Column," the best books to study for the paper on elementary mechanics and physics for the Preliminary Examination of the R.I.B.A.?—Yours, Manchester. "ANTONY."

No special works are recommended. The 1st edition (1888) of Quilt's "Encyclopædia of Architecture," which every student should possess from the outset, gives all that is required of these subjects in the examination. You should get the R.I.B.A. Kalendar (price s. 6d.) from the secretary, 9, Conduit Street, W., where you will find examples of the papers set at this examination and much useful advice to students.

THE STUDY OF ARCHITECTURE.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I have lately entered an architect's and general draughtsman's office but not in an architectural capacity. I wish to thoroughly educate myself in practical Architecture. Elementary classes are advertised in Building Construction and Historical Architecture. As far as my experience extends, I am inclined to think systematic self-education, with proper literature and practice, to be as practical a means of training as a course of weekly lectures. I am sufficiently advanced in general draughtsmanship to dispense with elementary education in this particular. Will you kindly give me the best information on the subject, and also what publications on the Art and Science of the Profession you think would be best studied under the circumstances, or whether you think the technical lectures of more value; also what subjects must be taken up in order to qualify for the examination of the R.I.B.A.? I may say that the office routine brings me into touch with practical work, and as an additional means of education.—Yours faithfully, W. E. D.

You should most certainly supplement your private studies by attending from time to time a course of lectures or classes. It is difficult otherwise for the student to avoid expending time and energies upon unimportant matters which will be of small use or service to him, and he will be likely to occupy himself upon one or two subjects to the neglect of parallel subjects which are essential to a useful education. There are excellent architectural classes and lectures in connection with the Polytechnic Architectural School 307, Regent Street, W.) and the Architectural Association (56, Great Marlborough Street, W.), where books are also lent to students. Particulars of the classes and the books recommended may be had on application to the respective secretaries. Admission as Associate of the R.I.B.A. is now only granted to those applicants who have qualified in a series of three examinations within an interval of two years between each. The Preliminary test, general knowledge acquired at school, and examines in mechanics, physics, geometrical and freehand drawing and perspective. The intermediate test, a general knowledge; and the Final, the knowledge that should be possessed by an architect on entering upon a private practice. Full particulars of these examinations, with examples of the papers set, with lists of books, and much valuable advice to students, will be found in the R.I.B.A. Kalendar, to be obtained of the Secretary, 9, Conduit Street, W., price 2s. 6d. See also answer to "E. S."

FEVER HOSPITALS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Could you kindly inform me through your JOURNAL the names of the best books to consult on the arrangements, &c., for fever hospitals?—Yours truly, September 9th, 1898. "STUDENT."

We cannot recommend any book upon this

subject. The men who are best qualified in these practical subjects do not write books. The best information will be found in the designs published in this and other professional journals during past few years. We may refer you to the competition for the Park Hospital, which was published about the end of 1894. The report of the successful architect, Mr. Edwin Hall, embodies all the soundest principles of the subject. It will be found in The Builder's issue of September 8th, 1894.

PERSPECTIVE DRAWING.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I wish to put a large site with about a dozen buildings (a workhouse) to perspective, or, in the alternative, to give a bird's-eye view. The buildings are on the side of a hill, consequently on different floor-levels. What scale drawing would be the best to work from? Would you kindly explain how I should start giving height from ground-plane to horizontal line, &c.? Thanking you in anticipation.—Yours faithfully, "KENTISH."

Dartford, September 28th, 1898.

The scale of the drawing you work from will not affect the size of your perspective, which will be decided by the distance of picture-plane from station point. One-eighth scale is usually quite big enough, but if you wish to introduce much detail, a larger scale might be used with advantage. When you have settled the height and position of your station point, which should be sufficiently high to show the relative positions of various buildings, you must draw a line at the same height across the sectional drawing or side elevation of your site. The vertical distances must be measured, throughout and in all cases, from this datum, and plotted down from a corresponding line drawn across your intended perspective. The vanishing points may be found, and the vertical heights produced into the picture in the usual way, and you will, of course, remember that all parallel lines in the whole group of buildings will vanish to the same point. If you place your station point above the building, you must allow for the perspective effect in the vertical lines, which will vanish in a point below the picture; but unless the perspective is sharp, this may be adjusted by the eye.

SCIENCE AND ART EXAMINATIONS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I shall feel greatly obliged if you will be so kind as to inform me what books are necessary to read up for the "Honour Course" in "Building Construction," in connection with the Science and Art Examinations.—Yours faithfully, H. G. M.

Port Talbot, South Wales.

Before entering upon any of these courses, you should thoroughly understand what you are doing. Write to the Secretary, Department of Science and Art, London, S.W., and enclose threepence for Syllabuses No. 9 "Architecture," and No. 10 "Architectural Design." For 7d. you may also get, post free, "Art Examination Papers" for any year between 1890 and 1897. The papers in each subject are not published separately.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR.—Will you kindly advise me as to what are the best books to study for the Examination in Architectural Design, as required by the Science and Art Department?—Yours truly, F. P.

Burton-on-Trent.

See answer to H. G. M.

A MYSTERIOUS and extensive underground fire was reported at the last meeting of the Sunderland Rural District Council. The sewers at Grangetown were in consequence of this fire in a very heated condition, and the mains in the roads were also affected so that the drinking water came warm from the taps. The surveyor has been instructed to examine and report upon the outbreak. Since the conflagration in July last, there has been quite an epidemic of fires in Sunderland.

Views and Reviews.

ELY CATHEDRAL.*

If we had not ideas of our own on the subject, there would be but little to say about what will appear at first sight to be merely a guide-book, but the name of Dean Stubbs gives us pause, and faced as we are by the fact that the booklet before us has appeared in twenty editions, we are convinced, without going further, that its merits must be extraordinary. One has only to read a few pages to be fully assured that this, although quite unpretentious, is better by far than most, for intimacy such as that of the Dean with these buildings can only be slowly acquired. Being based on the deepest feelings, it differs indeed from our own, and we would not have it rewritten. We have on our shelves the Rev. Canon Stewart's "Architectural History of Ely," to which the Dean has referred in his preface, and it is thought that a guide-book based surely on that can be wanting in little if anything. What it has in addition is the touch of the Dean's own hand and his ripest thoughts on the subject. It has, moreover, a "plan," without which a guide-book is naught—a "very careful and accurate plan of the cathedral church and the convent buildings," for which the heartiest thanks must be given.

E. R.

* "Handbook to the Cathedral Church of Ely." 20th edition. Revised. By Charles William Stubbs, D.D., Dean of Ely.

Under Discussion.

THE SHEFFIELD SOCIETY.

As an opening to the winter session, the members of the Sheffield Society of Architects and Surveyors dined together on Saturday evening week. A toast list was gone through after dinner.—The Vice-President proposed "The Royal Institute of British Architects."—Mr. C. J. Innocent replied, giving it as his opinion that the Institute could be made far more useful to the members by bringing itself more up-to-date.—The Town Clerk gave the toast of "The Sheffield Society of Architects and Surveyors."—The President, in the course of his reply, said the Society now possessed 115 members. He also paid a tribute to the new secretary, Mr. W. C. Fenton, and gave details of an attractive syllabus for the coming winter session.

SCOTTISH CHURCH PLANNING.

The Glasgow Architectural Association, at its last monthly meeting, had under consideration the subject of "Scottish Church Planning."—Mr. Blain, in describing the development of the Presbyterian Church, traced the alteration in plan which the introduction of choir and organ had entailed. He pointed out that the service of the church had of late years undergone great modifications. Nowadays the service might be considered in many cases suited more to the emotional than to the intellectual side of our nature. To plan a church for such service, the chancel might be more fully developed; its sacred character could be heightened by a careful disposition of the light, by proper placing of the choir, and by the use of sacred symbols and emblems. A feature should be made of the Communion table rather than of the pulpit.—Mr. Whitelash thought it a matter for congratulation that congregations were showing less of the dogmatic spirit which had hitherto prevented the church from being developed on the lines suggested by Mr. Blain.—Mr. Connor and Mr. Craigie maintained that the plan was developing on wrong lines. A church in which the preacher could be both seen and heard by his congregation still appealed to most Presbyterians as suited to their purpose. This, as Mr. Connor showed, did not militate against a church being also architecturally satisfying.—Mr. Hill, in concluding the discussion, pointed out that much that was good of the pre-Reformation times might fittingly be revived in our modern churches.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

CONTRACTS OPEN.

THE HACKNEY VESTRY. TO BUILDERS.

TENDERS are invited for the CONSTRUCTION of a Public UNDERGROUND CONVENIENCE at the north-east corner of the Town Hall grounds.

Plans and specifications may be seen, and bills of quantities obtained, at the office of Mr. JAMES LOVEGROVE, Chief Surveyor to the Vestry, Town Hall, Hackney, on payment of One Guinea, which sum will be returned by the Vestry after it has been ascertained that a bona-fide Tender has been sent in.

The contractor whose Tender may be accepted will be required to pay wages at rates not less, and to observe hours of labour not greater, than the rates and hours

set out in the Vestry's schedule, and such schedule will form part of the contract, and penalties will be enforced for any breach thereof.

Tenders, sealed, and endorsed "Underground Convenience," to be delivered at the Town Hall, Hackney, not later than FIVE p.m. on WEDNESDAY, 26th inst.

The Vestry does not bind itself to accept the lowest or any Tender.

By order,
 GEO. GROCOTT,
 Vestry Clerk.

COUNTY BOROUGH of CROYDON. TEMPORARY PUMPING PLANT.

Notice is hereby given that the Council are prepared to receive TENDERS for the SUPPLY and FIXING of the TEMPORARY PUMPING PLANT necessary to raise water from a borehole.

Such plant consists of a deep well pump complete, with T bob, connecting rod, spur gearing, and semi-portable steam engine; also lining borehole, and supplying 12in. cast-iron pipes. Contractors may quote for any of the items, which, with the exception of the cast-iron pipes, need not necessarily be new.

Full particulars may be had upon application to the Borough and Water Engineer, Town Hall, Croydon.

Tenders to be sent to me by ELEVEN o'clock in the forenoon on WEDNESDAY, OCTOBER 26th, 1898, endorsed "Temporary Pumping Plant."

The Council will not be bound to accept the lowest or any Tender.

By order,
 E. MAWDESLEY,
 Town Clerk.

WILTS COUNTY COUNCIL.**TO BUILDERS AND CONTRACTORS.**

Builders disposed to **CONTRACT** for the work of **BUILDING NEW COUNTY OFFICES**, at the back of Arlington House, Trowbridge, for the Wilts County Council, can see the plans and specification at the County Surveyor's Office, County Offices, Stallard-street, Trowbridge, between the hours of **NINE a.m.** and **FIVE p.m.** Copies of the bills of quantities and forms of Tender can be obtained from the County Surveyor, on written application, accompanied with a deposit of £1 ls., which will be returned on the receipt of a bona-fide Tender.

Sealed Tenders may be sent to the County Surveyor, on or before **OCTOBER 23rd, 1898**, but no pledge is given to accept the lowest or any Tender.

CHARLES S. ADYE,

County Offices, Trowbridge, County Surveyor for Wilts.
September 27th, 1898.

TO ROAD and SEWER CONTRACTORS.
HODDESDON URBAN DISTRICT COUNCIL.

The above Council invite **TENDERS** for the **MAKING-UP OF THREE STREETS** in their District, comprising a total length of **3400ft.**

The works include Carriageways, Footways, and Kerbs.

TENDERS are also invited for the Construction of Surface Water Sewers, comprising 44 yards of 15in. Cast-iron Pipe, 32 yards of 15in. Stoneware Pipe, 383 yards of 12in. Stoneware Pipe, 953 yards of 9in. Stoneware Pipe, and 131 yards of 6in. Stoneware Pipe, with the necessary Junctions, Manholes, Tumbling Bays, Ventilators, Catchpits, &c.

Plans and sections may be seen at the office of the undersigned, from whom the specifications, quantities, forms of Tender, and contract may be obtained on payment of Three Guineas, which sum will be returned to non-successful contractors on the receipt of a bona-fide Tender and the return of the specifications, quantities,

forms of Tender, and contract, and to the successful contractor on his executing his contract and bond.

Tenders must be on the forms supplied by the Council, and accompanied by the schedule of prices, and must be delivered at the office of the Council, addressed, The Chairman, Highways Committee, Council Offices, High-street, Hoddesdon, sealed, and endorsed "Tender for Works," by not later than **NOON on MONDAY, OCTOBER 24th instant.**

The Council do not bind themselves to accept the lowest or any Tender, and reserve the right of letting both contracts to one contractor or otherwise.

T. SALKIELD, Surveyor.

Briscoe-road, Hoddesdon,
October 1st, 1898.

HAMPTON WICK URBAN DISTRICT COUNCIL.

The above Council invite **TENDERS** for the Supply and Delivery on land adjoining their Wharf by the River Thames of

550yds. (in Two Lots) of **GUERNSEY GRANITE** or **QUENAST STONE**, broken to pass a 2in. ring.

Sealed Tenders, endorsed "Tender for Road Material," to be sent to the Chairman on or before **NOVEMBER 5th next.**

The Council do not bind themselves to accept the lowest or any Tender.

J. NIXON HORSFIELD, F.S.I.,

District Surveyor.

Hampton Wick,

October 11th, 1898.

1

TO BUILDERS and CONTRACTORS.

The Committee of the Croydon Hospital invite **TENDERS** for the **ERECTION of a NEW WING**, &c.

The drawings and specifications may be seen at the Office of the Architect, Mr. **CHARLES HENMAN**, 64, Cannon-street, E.C., and bills of quantities there obtained on payment of £3, which will be returned to those who send in a bona-fide Tender.

Tenders to be delivered at the Hospital, London-road, West Croydon, before **SEVEN p.m.** on **TUESDAY, OCTOBER 25th, 1898.**

The Committee do not pledge themselves to accept the lowest or any Tender.

By order,

JOHN JONES, Secretary.

Croydon, September 1898.

INTRODUCTION OF NON-FLAMMABLE WOOD
INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to
Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following
UNITED STATES WAR VESSELS:—
BATTLESHIPS.—"IOWA" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."
And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.
"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known
colossal Buildings in New York:—
THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING,
(each of which is over eighteen stories high).
"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company
by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,
2, Army and Navy Mansions, Victoria Street, London, S.W.

HEALTH EXHIBITION AT BIRMINGHAM.

SOME of the features of this big side-show of the Sanitary Congress have already been touched upon in these columns. There are many interesting exhibits only remotely associated with sanitation, but which are not unimportant factors in the general health of the community. The greatest and most important of the four divisions is that devoted to construction and sanitary apparatus. Of course, drain-pipes and their accessories form a large proportion of the general display. There are, in fact, drain-pipes everywhere, and of all sorts, sizes, and descriptions, but the exhibitors have, by the exercise of a little ingenuity, made them attractive by building them in bricks and mortar. Building construction prevails to a remarkable extent, not only for the exhibition of drain-pipes, but other sanitary apparatus, and in this respect variety is added to the display, which will materially increase the natural interest of the exhibition. At one stand—that occupied by the Pendleton Sanitary Engineering Company—an elaborate red-brick wall has been erected to illustrate the back of a dwelling-house for the purpose of displaying

A NEW SANITARY ASHBIN.

This is especially suitable in the case of houses approached at the rear by means of a passage common to a row, or even by a side entry. The bin is built to the wall, and can be emptied by the scavenger without it being necessary for him to actually intrude upon the privacy of the household. Another interesting stand is that of Mr. William Eggington, Smethwick, who shows a portable sewer-gas extractor and destroyer in conjunction with sewer disinfectors, the apparatus consisting of a fan which draws the gas from the sewer into a chamber, and thence through a breeze fire. Steam disinfectors, with automatic recording gauges controlling the duration and sufficiency of each operation, as well as filters and plans showing the application of Pasteur filters, are to be seen at the stand of Messrs. Defries and Sons, London. Just as there is an infinite variety of drain-pipes, there is a large assortment of lavatories, baths, traps, and gulleys. Messrs. Doulton and Co., London, make a feature of their shower, douche, spray, and plunge bath, the various processes being conveniently set in operation by means of one tap, while another attraction is the ceramic ware fireplace erected in terra-cotta, and fancifully glazed and decorated. A stand worthy of inspection is that occupied by the Septic Tank Syndicate, of Exeter, who are showing in working order a model which illustrates very clearly the Company's method of

PURIFYING SEWAGE BY NATURAL MEANS.

The installations are simple in construction and entirely automatic in action, consisting of septic tanks, in which all organic solids are liquefied and the formation of sludge avoided, and alternating filters. Another model which works on the same principle is for use in a private residence, and the experiments made with this are said to be highly satisfactory. Messrs. Farrer, Barber, and Co., Birmingham, make a speciality of their pneumatic lavatory. It is simple in construction, and the necessity of overflow pipe and grating is obviated, inasmuch as syphonic action is set up, and the water runs away without any overflow. An interesting model, set in masonry, by Messrs. Dibble and Sons, Birmingham, shows a sink and automatic waste water flush closet, complete in every respect. The merit of it is that the pan is flushed and cleansed by the water from the sink without the aid of a separate flushing apparatus. There are other flushing tanks and appliances at several stalls. The leading firms exhibiting include Twyford's Limited, of Hanley; Shanks and Co., Glasgow; George Jennings, London; T. Wragge and Sons, of Burton-on-Trent; W. Harriman and Co., of Newcastle-on-Tyne; Burn Bros., London; Major and Co., Hull; The Sanitary Appliance Company, Dublin; Duckett; Stock, Son, and Taylor, of Birmingham; Oates and Green, of

Halifax; Skey and Son, Limited; Sutton and Co.; Evered and Co., London; John Jones, of Chelsea; Gaskell, Chambers, and Foulkes, Birmingham; Martineau, Beames, and Madeley, Birmingham; Day's Waste Water Closet Company, Wolverhampton; and W. T. Allen, of Birmingham. Messrs. Callender and Montgomery, London, display samples and sections showing the value of bitumen as a protection in damp-courses. A tank lined with bitumen is seen in action. The section of the brickwork standing in the water is preserved by means of the bitumen, and a model of the reservoir is also shown to be equally impenetrable by the dampness. A new closet, peculiarly adapted for use in asylums, is exhibited by Messrs. Adams and Co., its chief characteristic being that there are no handles or projections by which patients might be able to hurt themselves. Messrs. Boydell and Sons, Leigh, are showing

THE ONLY SELF-FLUSHING GULLY

in the exhibition. This gully is for house drains, and, owing to its being sealed at the back, no smell can pass into the house. There is also a gully for the street, possessing an appliance for flushing from town mains, testing with smoke test, and ventilation. A curious new boiler-bath, the only one of its kind in the hall, is exhibited by Mould's Patent Boiler Bath Company, Birmingham. The bath is especially suitable for small villas and workmen's dwellings. It is of the orthodox size, and can be heated in a quarter of an hour by means of a small coal or slack fire, the fire-box being fixed under one end of the bath. It has a double flue, so that when the water is sufficiently hot the heat is cut off by closing a damper, which shuts one flue and opens the other. The ventilating section is another well-filled one, a notable stand being that of Messrs. Thomas Ash and Co., of Cannon Street Birmingham. The stand is constructed on a novel plan, entirely of zinc, "Cooper's Acme" and many other ventilators and chimney cowlings being arranged, and shown to the best advantage. Several firms have on view distributors of divers patterns for delivering sewage, refuse destructors, and smoke-consuming boiler furnaces, fans, new cooking ranges, grates, &c.; one of the largest exhibitors of ranges, &c., being Messrs. Parker, Winder, and Achurch, Birmingham. Messrs. A. R. Dean, Limited, Birmingham, are represented at two stalls. At the first they display a syphonic trap which may be fitted to any closet basin, a "well" fire which will burn for twenty-two hours without feeding, and which consumes its own ashes, a Priory range in action, the bottom grate being so designed that the burning embers may be raised or lowered at will, and appliances for heating by hot water or steam; while at the second stall modellers are at work demonstrating the process of

MODELLING IN FIBROUS PLASTER.

A new kind of cinder-sifter and dust-bin is exhibited by Messrs. Arkinstall Bros., Birmingham. The cinders are placed in a receptacle with a covered top and shaken, the best of the fuel being preserved, while the dust falls into the bin beneath. The firm claim that the method is not only more economical, but cleaner than existing systems of riddling. There are also stands at which are displayed water sterilizers, models of systems of water filtration, art pottery, cisterns, pneumatic ejectors for raising sewage, confectionery, disinfecting powders, soaps, &c., aerated waters, a steam tip-wagon for the collection of house refuse, ambulance vehicles for the conveyance of infectious or sick cases, and patent tipping vans and wagons, among the latter being an assortment shown by Messrs. Glover and Sons, Warwick. The Birmingham Municipal Technical School have a stall, at which is exhibited specimens of the students' work; and the Birmingham Fire Brigade are showing improved fire appliances, as well as models of different parts of the apparatus of the Brigade. In the galleries there are a good many stalls of general interest. Diagrams showing the vital statistics of the respective communities are exhibited by the public authorities of Birmingham, Cardiff, Huddersfield, Liverpool,

Newport, Nottingham, Norwich, Sheffield, and Sunderland; while plans have been sent from Liverpool, and drawings of artisans' dwellings, destructor works, electric light installations, &c., from Bristol. On Stand 49 Messrs. J. Duckett and Son, Limited, of Burnley, Lancashire, display an interesting collection of flushing tanks, water-closets, urinals, latrines, &c., among which we noticed in particular a set of isolated closets for four persons; these are of very novel construction. The four seats are flushed with an automatic syphon flushing tank, from which a pipe is connected with an air chamber in the latrines to promote syphonage, and to admit air automatically to stop syphonage, retaining at the proper moment a sufficient quantity of water to recharge the basins. A new form of slop-water closet, with many advantages, is also shown in working order. The tipper is situated in a box elevated above the yard level, and discharges through a trapped pipe into the side of the closet basin at the top, which ensures the back of the closet basin being thoroughly cleansed after each flush; the closet basin and trap are combined in one pedestal, the drain, therefore, is required only to be very shallow. A set of amber enamelled urinals of very highly glazed ware is also included in the display. Messrs. Duckett are awarded a bronze medal for these urinals. Various forms of street and yard gulleys, air bricks, automatic flushing tanks, with other varieties of closets other than those named, complete this display.

ILLUSTRATIONS OF HOSPITAL CONSTRUCTION

have been contributed by Mr. H. Greenway, of Plymouth; the British Institute of Preventive Medicine have sent a collection of various bacteriological culture, specimens of anti-toxins, and photographs from the laboratories of the Institute; the Director-General of the Ordnance Survey has supplied Ordnance maps of Birmingham and Lancashire. Sir Archibald Geikie (Director-General of the Geological Survey) has sent geological survey maps and sections; architectural drawings have been contributed by the Birmingham Architectural Association, and photographs and views of health resorts by the Midland and Great Western Railway Companies. Mr. Benjamin Gilbert, Birmingham, has on view a varied assortment of tents, tarpaulins, portable ballrooms, &c., and sanitary requisites are exhibited by Messrs. Southall Brothers and Barclay. At several stands may be seen hygienic clothing, and hospital, sick-room, and domestic appliances. Messrs. Gale and Sons, Birmingham, and Messrs. Whitfield and Co., Birmingham, are showing special bedsteads, designed by Mr. Lawson Tate, for use in hospitals, asylums, and for the benefit of invalids at home. A popular feature in the gallery will be the stall occupied by the Birmingham Midland Training Institution for Nurses, where practical demonstrations in nursing, by means of dummy patients, are to be given periodically by some of the nurses. Many stalls on the floor and in the gallery are devoted to exhibits which have no connection with sanitary science, but they add to the attractiveness of the general display. The following

LIST OF AWARDS

has been issued:—

Silver Medals.—Allport's, Birmingham, Jaeger woollen underclothing; Burroughs, Wellcome, and Co., London, case for water analysis, and chemicals in solids for water analysis; Burroughs, Wellcome, and Co., compressed chemical substances; Burt, Boulton, and Hayward, Limited, London, products of coal tar and ammoniacal liquid; Cadbury Brothers, cocoa; F. C. Calvert and Co., Bradford, Manchester, pure carbolic acid; the Cannon Hollow Ware Co., Bilston, Staffordshire, enamelled cast iron; J. Defries and Sons, Limited, London, Pasteur Chamberland filter; J. S. Fry and Sons, Limited, Bristol, pure cocoa; Wilson and Stockall, Bury, Lancashire, brougham ambulance; Wilson and Stockall, accident ambulance.

Bronze Medals.—Aerators Limited, London, method of aerating water by means of compressed carbon-dioxide; Arkinstall Brothers,

Birmingham, simplex cinder sifter; A. Boake Roberts and Co. Limited, London, liquid sulphur dioxide for disinfection; Brion, Pate, Burke, and Co., London, petanelle fabrics; Clark's "Optimus" Coffee Co. Limited, South Lambeth, S.W., Whitehead's automatic taps for drawing off liquids; Eclipse Brass and Copper Co. Limited, Halifax, Jackson's self-feeding water boiler; Farrer, Barber, and Co., Birmingham, the "Helliwell" system of glazing; Farrer, Barber, and Co., combined sink and lavatory; G. J. Hutchings, London, Hutchings' food steamers; Jeyes' Sanitary Compounds Co. Limited, London, Jeyes' fluid; Bernard Kuhn, London, chinosol; Mellin's Food Co., Peckham, London, Mellin's food for invalids; Oates and Green, Limited, Halifax, salt-glazed wash-tub and rubber combined; Pendleton Sanitary Engineering Co., Manchester, Dr. Quine's ashbin; W. W. Rolston, Birmingham, thermometer for hospital wards; Southall Bros. and Barclay, Birmingham, aerated waters prepared from distilled water; Twyford's Limited, Hanley, triple vegetable-sink; Twyford's Limited, "Ideal" sink in two compartments; United Alkali Co. Limited, Widnes, chloros; Vimbos Limited, London, concentrated vimbos.

THE Local Government Board has practically refused to sanction the application of the Cheltenham Corporation for permission to raise £13,410 for the purposes of sewerage and sewage disposal. The Corporation are the owners of sewage farms in villages to the west of the borough, and these farms have hitherto been let to farmers. The manner in which the sewage has been treated on the land has been the subject of loud and frequent complaint by the villagers of Staverton and Boddington, and it was with the object of meeting and remedying these complaints that much of the work was proposed to be done with the £13,410 the Corporation wished to borrow. At the inquiry held a few weeks ago by Colonel Marsh, on behalf of the Local Government Board, further expression was given to these complaints, with the result that, as appears from a letter now received by the Town Clerk of Cheltenham, the Local Government Board are "satisfied that the present arrangements for the treatment and disposal of the sewage are unsatisfactory." In particular the letter goes on to state, "it is observed by the inspector that there appears to be no proper supervision of the farms by the Town Council, that the system of irrigation adopted by the farmers is inefficient, and that there were indications of a great deal of the liquid sewage finding its way untreated into the ditches and water-course. The Board's experience shows that as a general rule the results which ensue upon a local authority divesting itself of the direct control of sewage lands by letting the lands for agricultural purposes are unsatisfactory, as it not infrequently happens that the farmers are more concerned to make a profit for themselves than to properly purify the sewage. The Board, therefore, consider it most desirable that the management of sewage farms should be entirely in the hands of the local authority, whose primary object would be to avoid creating a nuisance or infringing the provisions of the Rivers Pollution Prevention Acts." Accordingly the Local Government Board request that the Town Council will take this question into their immediate consideration, with the view of determining the present arrangement and taking the entire management of the sewage farms into their own hands. In any case the Town Council are advised to consider the expediency of applying some such remedy for the complaints referred to as the use of alumino ferrie or lime at the sewage works, before the sewage is taken to the farm. It is highly probable that the Corporation will adopt the suggestion of the Local Government Board, and, at the earliest possible moment, take over the management of the sewage farms, and introduce either the Exeter or some other system for effectually remedying the grievance complained of by the residents in the vicinity of the farms.

Surveying and Sanitary Notes.

THERE appears to be a great future for the Nile in other than a political sense. Splendid progress is being made with the tapping of the great river at its higher level above the cataracts. The water will then be conducted to vertical shafts, down which it will fall to drive turbines. The power thus generated will run dynamos, from which electricity in the form of alternating or continuous current will be transmitted to points near or remote. The water, after passing through the turbines, will be restored to the river at a lower level, or else used to irrigate the land. Electricity will be applied, not only in pumping for the irrigation, but in driving machinery for preparing the raw products of the soil, spinning cotton, weaving silk, and various other industries. But even this surprising scientific scheme is eclipsed by the later proposal, to raise water to an elevation by the sun's rays and use it to run a water wheel and dynamo—the water being contained in tanks within a structure of glass similar to a conservatory; the sun's heat, expanding the air in the first tank containing water, forces it into the tank above, the air being cooled by screening the tank, and the water then raised to the next tank. The sun's rays acting on a square mile will, it is calculated, furnish one million horsepower, and, with a temperature of 50deg. in the glass houses outside, the efficiency of the arrangement is believed to be practicable.

MR. UNDER-SHERIFF BURCHELL and a special jury, at Red Lion Square, Holborn, heard the case of "Hill's Trustees v. the School Board for London." This was a claim for compensation in respect of the freehold interest in premises, Nos. 70, 72, 74, and 74a, Tanner Street, and Nos. 1 to 8, Assembly Place, Bermondsey, the site being required for a Board School. Mr. Littler, Q.C., and Mr. Bartley Dennis appeared for the claimants; Sir William Marriott, Q.C., and Mr. A. J. Ram represented the School Board. Mr. Littler stated that the property had been in the possession of the claimants since 1874, and had steadily increased in value, especially since the opening of the Tower Bridge and the extensive clearance of property in the vicinity. He called Mr. E. H. Eason (Messrs. Reynolds and Eason), who stated that the area of the property in question was 14,730ft., which he valued at 4d. per foot per annum, or £245 10s., and capitalised at 25 years' purchase, £6137. From that he deducted £452 in respect of existing leases, making £5685, to which he added £933 for the buildings and 10 per cent. for compulsory sale, making a total claim of £7280.—Mr. James F. Field (Messrs. Field and Sons), ex-president of the Auctioneers' Institute, and Professor Banister Fletcher gave confirmatory evidence.—On behalf of the School Board, Sir William Marriott admitted that property in Bermondsey had been increasing in value owing to the erection of the Tower Bridge, but the fact that the property in question had not been included in the betterment area of the Tower Bridge (Approaches) Bill showed that it was not likely to be enhanced in value. He called Mr. Samuel Walker (Messrs. Walker and Sons), who valued a portion of the land at 4d. per foot, and the remainder, back land, at 2d. per foot, as a cleared site. His detailed valuation amounted to a total of £3948, to which he added 10 per cent., the customary allowance for compulsory sale, making £4340.—Mr. W. P. Goulding, Mr. David Burnett (Messrs. Bean, Burnett, and Eldridge), and Mr. J. R. Cooper (Messrs. Ventom, Bull, and Cooper) gave similar evidence as to value.—The jury awarded the claimants the sum of £6150, plus an allowance of 10 per cent. for compulsory sale, £615, making a total compensation of £6765.

WHEN a Board of Works spends £10,000 on the construction of a dust destructor, they naturally expect that it will be capable of

calcining the refuse put into it. But this is just the ground of complaint which the Poplar Board has against the contractor for the new erection. Instead of burning 100 tons of refuse a day, as stipulated, they complain that it will only consume 36 tons. The committee recommended that no further payment should be made to the contractors till they had furnished a reason for the small quantity of refuse burned. The contractors wrote laying the blame on the men, "who would not put their best work into the affair." The Board eventually agreed to refer the report back to the committee to ascertain the Board's position in the matter.

IN consequence of pressure from the West Riding Rivers Board, the Councils of the districts of Luddendenfoot, Midgley, and Warley agreed to form a joint sewage scheme, and at a special meeting of the Warley Council on Monday week Mr. G. B. Waugh explained the plans and estimates, which had been prepared by Mr. J. Waugh, C.E., of Bradford. The plans were approved, and it was decided that application be made to the Local Government Board for £12,700 to carry out the works. The only site available in the district for the joint outfall works is the Highroyd Farm, within the Luddendenfoot district. Parliamentary plans have been deposited, and a provisional order has been applied for in reference to the purchase of this land, 26 acres in extent. Mr. Waugh is strongly in favour of (1) purification by precipitation, (2) settling tanks of large capacity, and (3) land filtration.

THE Loughborough Town Council has decided to construct some important waterworks at Blackbrook, in order to impound the whole of the drainage of this extensive watershed of the Charnwood Forest and satisfy the present considerable and growing demand of the consumers. The principal structure will be a reservoir to contain 506,000,000 gallons, or 253 days' supply at the rate of 2,000,000 gallons a day. The reservoirs will be formed by a dam across the narrowest part of the gorge of the Blackbrook valley, and will form a lake nearly a mile long, and two and three-quarter miles round. The dam will be 85ft. high and 475ft. long. The estimated cost is £65,000.

CROYDON has long enjoyed a reputation as the healthiest town in England, and its sanitary arrangements have frequently been held up as models to other towns. But during the long drought this reputation has not been upheld, and while the roads have lain thick in dust the drains have emitted through the street gratings a most malignant odour. Why disinfectants are not used, or, if used, properly used, is a matter of surprise to Croydon residents.

REFERENCE was recently made to the attempt to resuscitate the old waterway between the Thames at Lechlade and the Severn. The surveyor writes to say that the work of renovation has been going on for about three years, and that it is now nearly finished. They have commenced pumping into the summit level, and when the canal is full it will be opened for traffic. The concern is now entirely out of the hands of the Great Western Railway Company, and indeed has been for the past three years. It was handed over to a Trust formed for the purpose of working the canal in September, 1895. The headquarters of the Trust are at Stroud, in Gloucestershire.

THE Duke of Cambridge has consented to open in December the new Kingston-on-Thames Jubilee Hospital, the site for which he presented to the borough.

At their last meeting the Sanitary Committee of the Bradford Corporation adopted a report from the Medical Officer of Health (Dr. Arnold Evans) in which he recommended that Longlands Street, Longcroft Place, and the streets immediately adjoining should be scheduled as insanitary areas with a view to the demolition of the property. The streets in question form absolutely the worst and lowest quarters of Bradford, being mainly occupied by the distinctly criminal classes.

VENTILATION.

By W. N. TWELVETREES, M.I.M.E., M.S.I.

(Continued from page xxxvii.)

II.

THE function of breathing or respiration may be regarded as constituting in itself a complete system of ventilation and heating, in which the blood is purified by combustion and the heat thereby generated serves to maintain the temperature necessary for life.

In the human frame the lungs contain cellular chambers through which the whole of the blood circulates, being separated from the spaces reserved for air by thin membranous partitions. The volume of air contained in the lungs during respiration is estimated at from 180 to 240 cubic inches, the average being 210 cubic inches, made up, as shown in Fig. 8, of breathing or tidal air, supplemental air and residual air. A further quantity may by effort be drawn in, and this is termed complementary air. Including this, it is possible the lungs may contain a total of from 200 to 300 cubic inches, the volume being affected mainly by the stature of the individual.

Purity of air in the lungs is maintained by the alternate operations of inspiration and expiration, and each is performed, in the adult, about 16 times per minute. In this manner from 30 to 40 cubic inches of air are drawn in at every inspiration and mixed with the store of residual air. At every expiration, a similar quantity of gases, consisting of air and the products of combustion, are discharged. The law of gaseous diffusion, to which reference has previously been made, not only assists in the mixing of the fresh with the residual air, but enables oxygen to penetrate the membranous partition, and thus to come into contact with the blood, where it facilitates the removal of such products as carbon dioxide, water and volatile albuminous compounds.

The weight of carbon exhaled by an ordinary man during 24 hours, varies from 0.44 to

instance will be $0.0003 \times 12,906 = 3.87$ units per minute. Vapour exhaled usually ranges from 0.375lb. to 1.625lb. in 24 hours, but in addition to water vapour there are included other volatile substances. It is therefore difficult to state precisely either the quantity

FIG. 8.

of oxygen consumed or the heat produced, but assuming hydrogen in the form of water to be 0.0003lb. per minute, there will be required for combination 0.00024lb. of oxygen, which will produce 0.00027lb. of vapour. The heat generated (1lb. of hydrogen = 62,535 units) will thus be $0.00003 \times 62,535 = 1.87$ units per minute.

TABLE VI.

CHEMICAL AND PHYSICAL CHANGES EFFECTED IN ONE CUBIC FOOT OF AIR BY RESPIRATION, &c.

Chief Constituents.	Air inhaled 62° Fahr. Weight 0.0755lb.	Gases exhaled 92° Fahr. Weight 0.0723lb.
Oxygen ...	0.01724lb.	0.0110lb.
Nitrogen ...	0.05740 "	0.0542 "
Vapour ...	0.00088 "	0.0022 "
Carbon dioxide	0.00005 "	0.0049 "

In addition to loss of oxygen due to the presence of carbonic acid and vapour in the breath, a further quantity is absorbed by the blood, being ultimately removed from the system in a state of combination through the excretory organs. The total effect produced upon air by the act of respiration must, therefore, include the latter consideration, and in Table VI. are shown approximately the chemical and physical differences existing in air before and after respiration. These changes are also represented in Fig. 9.

It will be observed that the human system, although perfect in its working, is constituted so as to prevent exhaustive utilisation of oxygen contained in the air. Therefore, the exquisite ventilating apparatus represented by the lungs always maintains a certain standard of purity in its internal air chambers. It follows that a much larger quantity of air is required for respiration than would otherwise be necessary, and the volume of pure air to be provided for this function must be governed by the mechanical effect of the lungs, considered in connection with other qualifying conditions. The volume of air drawn in and the relative proportions of the gases exhaled vary in accordance with the work performed by the body, with the time of the

day, and with climatic influences. Fig. 10 shows the results given by various experiments bearing on this subject. Taking the mean of numerous physiological tests, it is found that the average quantity of air breathed by an ordinary man when in a state of rest is 33.6 cubic inches at each respiration. The ordinary number of respirations in an adult being 16 per minute, 537.6 cubic inches become necessary for each person per minute. For reasons previously stated, air should not be re-breathed, and the above is therefore the minimum quantity which should be allowed for respiration separately considered, whilst in hospitals and workrooms a much larger volume is required.

Moisture passing through the skin and vapourised by the heat of the body, varies considerably according to circumstances, but it will probably be fair to assume the average quantity as 0.014lb. per minute. For the evaporation of this weight of moisture 1.56 heat units per minute would be taken from the body, thus exercising a cooling influence. The volume of air necessary for absorption of the vapour may be calculated by the aid of the Hygrometric Chart, previously given, but more accurately from Table VII.

Assuming the air available to be at 62deg. F. and with 62deg. of humidity, one cubic foot will contain $0.000881 \times 62 = 0.000546$ lb. of vapour. The difference between 0.000881 and 0.000546 = 0.000335lb., which is the effective capacity of each cubic foot, and the absorption of 0.0014lb. per minute will therefore require 4.18 cubic feet of air.

In practice the quantity varies from 3.5 cubic feet in winter to 5 or 10 cubic feet in summer, chiefly owing to hygrometrical differences, and it must further be borne in mind that air, although vitiated so as to be unsuitable for respiration, may be still capable of absorbing and carrying away vapour. To the latter point further attention will be directed.

For the purpose of arriving at the volume of air required to carry away animal heat further calculation becomes necessary.

Taking the heat generated by combustion of carbon and hydrogen as before, at 3.87 and 1.87 units per person per minute, we have a total of 5.74 units. Of this 1.56 units have already been used in vaporising moisture from the skin, and 3.18 units remain for dissipation.

FIG. 9.

0.7lb. Taking the weight as 0.0603lb. per minute, 0.0008lb. of oxygen will be required for its conversion into carbonic acid. As the combustion of 1lb. of carbon evolves 12,906 heat units, the number produced in the present

FIG. 10.

About .5 unit is probably already contained in breath exhaled, assuming it to be 30deg. higher in temperature than the air. As, however, it is undesirable that temperature should be increased more than 20deg., sufficient air must

be provided for dealing with the 3.18 units. If these are to be removed by air alone, the requisite volume will be found by the formula:

$$V = u \div (t \times s \times g)$$

Where V = cubic feet per person per minute, u = heat units, t = increase of temperature, s = specific heat of air, and g = weight of a cubic foot of air at the original temperature. In the present case the figures are:—

$$V = 3.18 \div (20 \times .238 \times .0761) = 8.78 \text{ cubic feet.}$$

Conditions entailing the removal of heat, entirely by air, exist only in crowded assemblies, where radiation from the person is

SANITARY MATTERS AT BIRMINGHAM.

AS the result of a conference between the Birmingham City Surveyor and the Engineer of the Midland Railway Company, it was arranged that a new sewer 6in. circular should be constructed upon a line almost parallel and close to the river Rea. The cost of constructing this new sewer, putting in the foundation and wall, was

Builders' Notes.

A SINGULAR strike of bricklayers has occurred in connection with the building of the electric light station for the St. Mary, Newington, Vestry, at Penrose Street, Walworth. It is stated by the contractor that 26 out of the 31 bricklayers engaged upon the work struck, because, as they acknowledged, one of the men was getting up his corner too quickly. The bricklayer referred to was at one end of the wall, and the other men had to level up to the work performed by him. The contractor further says that the men who ceased work demanded the discharge of the workman referred to, and refused to resume work until he was sent away. The places vacated by the bricklayers have not yet been filled up. The man objected to is a fully-qualified member of the Bricklayers' Union. The employer contends that the compromise between the Master Builders' Association and the Bricklayers' Union arrived at some two years ago has been broken, and he has lodged a complaint with the men's union.

THE first step in a practical direction towards the completion of the scheme for connecting Hammersmith with Hounslow by electric trams has been made. Large gangs of men have taken possession of the Chiswick High Road, between Young's Corner and Kew Bridge, and commenced to lay the concrete beds over which the electric trams will run. When completed, the scheme will embrace 20 miles of electric trams, for in addition to the Hammersmith-Hounslow service, there will be extensions to Hanwell and Uxbridge. It is hoped that the first section between Young's Corner and Kew Bridge will be open for traffic this side of Christmas. Some further arrangements have to be made with the London County Council before the full scheme can be carried out, but in view of the strong expressed opinion by the Parliamentary Committee when the Bill was before them, it is not anticipated that there will be any unnecessary delay.

THE building trade is now in a more flourishing state than has been the case for years past, and all the leading firms are so full of work that they cannot possibly undertake any more contracts. Proof of this was afforded at the last meeting of the London County Council. Not a single tender was received in reply to the Council's advertisement relating to the erection of two blocks of working-class buildings on the Boundary Street area and some cottage dwellings at Brook Street, Limehouse.

A SERIOUS accident occurred the other day to workmen employed on the new extensions of the London and North-Western Railway at Crewe. They were driving into a drift for tunnelling operations when a huge bank of timber, used as one of the struts, gave way. The men tumbled into the tunnel underneath. Many of them were seriously injured. An extensive fire, involving the destruction of a quantity of valuable property, occurred a few days ago at the yard and works of James Hyaulason, contractor, of Islington. The premises form a large square at the back of Liverpool Road, Islington. Owing to the inflammable material stored in the yard, the flames reached gigantic proportions. The warehouse of four stories adjoining the yard was completely destroyed.

TABLE VII.—WEIGHTS OF AIR, VAPOUR, AND MIXTURES OF AIR SATURATED WITH VAPOUR, AT DIFFERENT TEMPERATURES.

Temp. Fahr.	One cubic foot of dry air, in lbs.	Mixtures of air saturated with vapour.				
		Air in one cubic foot of mixture, in lbs.	Vapour in one cubic foot of mixture, in lbs.	Cubic foot of mixture, in lbs.	Vapour mixed with lb. of air, in lbs.	Dry air mixed with lb. of vapour, in lbs.

practically stopped. Under ordinary circumstances it is reasonable to assume that at least half the heat would be disposed by radiation. Consequently, the air apportioned for the present purpose may be between 4 cubic feet and 9 cubic feet per person per minute, according to circumstances.

(To be continued.)

FOR some little time it has been known that a scheme was in the course of formation for the construction of a pier at Lynmouth, and, as the want of such a structure has been keenly felt, considerable interest has been evinced in the progress of the negotiations. The initial difficulties having been overcome, the promoters consulted Mr. Frank Robinson, the pier engineer, and under his direction soundings have been taken and the foundation proved to be eminently suitable. The scheme is that the pier, a screw pile one, shall run out from the eastward—at Blacklands, near the Manor House—upwards of 1000ft., and the end will be of double face construction for the convenience of steamer traffic up and down the channel. At the end of the pier will be a bandstand and pavilion, and it is also intended to erect a few shops as well. Communication with the pier will be by a 16ft. wide roadway, which will come out at the Countisbury Road, a short distance from the Torrs Hotel. The cost of the scheme will be about £25,000, so that besides being useful, the structure should be ornamental as well.

estimated by the surveyor at £28,000, and towards that amount the Midland Railway Company were willing to contribute £8333, a third of the estimated cost. The Company also requested the Public Works Committee to divert and reconstruct that portion of the sewer between Lawley Street and Viaduct Street, and of the estimated cost of £2800 they agreed to contribute £2300. From the boundary of the Midland Railway Company's property the existing sewer ran through land of the Corporation Gas Department, and in connection with extensions going on there the Gas Committee thought that it would be very advantageous if the new Retort House could be built over the site of the existing sewer. The diversion and reconstruction of the sewer was suggested to the Public Works Committee, and the total cost of that portion of the work, providing for a 7in. circular sewer, was estimated at £21,000, towards which the Gas Company agreed to contribute £13,000. Smaller items brought the total expenditure involved up to £57,000 odd, and the contributions thereto amounted to £23,633, leaving £33,000 odd to be borrowed. The application for sanction to borrow, in respect of sewers, included a further item of £2260. The Town Clerk also called evidence before the inspector in support of the applications to borrow £7000 for extensions at the Saltley depot wharf, and £4730 for purposes of paving and other street improvements. In the latter connection £2800 was required in respect of the purchase of property and other matters.

Property and Land Sales.
HAMPTON AND SONS,
ESTATE AGENTS, AUCTIONEERS, AND VALUERS.

1898.
HAMPTON and SONS beg to announce that their AUCTIONS OF LANDED ESTATES, Town and Country RESIDENCES, INVESTMENTS, BUSINESS PREMISES, and other PROPERTIES are held MONTHLY at the Mart, Tokenhouse-yard, E.C.
Auctions can also be held on other days in Town or Country by arrangement; also Sales and Valuations of Furniture, Pictures, Farming Stock, Timber, &c.
List of Estates, Town and Country Residences, Hunting Boxes, and Sporting Properties can be had gratis on application to HAMPTON and SONS (Ltd.), 1, Cockspur-street, S.W.; or by post, three stamps.
Auction and Estate Offices, 1, Cockspur-street, Pall-mall, S.W.

Sales for the Year 1898.—Telephone No. 669 Bank.—Telegraphic address, "Akaber, London."
MESSRS. BAKER & SONS beg to announce that their SALES OF LANDED ESTATES, Investments, Town, Suburban, and Country Houses, Business Premises, Building Lands, Ground-rents, Reversions, Shares, and other Properties will be held at the Mart, Tokenhouse-yard, E.C., on the following Fridays during the year 1898:—
October 23 | November 11 | November 25 | December 9
Auctions can be held on days besides those above specified.—11, Queen Victoria-street, E.C.

By order of the Bridge-house Estates Committee of the Corporation of the City of London.—A highly valuable Building Site, covering an area of considerably over an acre in the heart of the City.
MESSRS. BAKER & SONS are instructed by the Bridge-house Estates Committee to LET by AUCTION, on Building Lease, for a term of 80 years, at the Mart, Tokenhouse-yard, on FRIDAY, OCTOBER 28th, at TWO o'clock, to be offered in one lot, and if not disposed of in four lots, the important BUILDING SITE, comprising Nos. 5, 6, and part of No. 7, West-street, Nos. 36 to 48 (inclusive), Finsbury-circus, Nos. 2 and 4, Circus-place, Nos. 101 to 116, London-wall, and Albion Hall, with warehouses, &c., adjoining, occupying a total area of 49,000ft., and possessing frontages of about 750ft., offering magnificent sites for the erection of bank, insurance, and other offices, shops, professional or business premises, well worth the attention of builders, capitalists, and others, affording an opportunity seldom obtainable of acquiring prominent building sites in the City.
Particulars, plans, and conditions of sale of the CITY COMPTROLLER and CITY SURVEYOR, Guildhall, E.C.; and of the AUCTIONEERS, 11, Queen Victoria-street, E.C.

Sales by Auction for the Autumn, 1898.—Messrs. DEBENHAM, TEWSON, FARMER, and BRIDGEWATER beg to announce that their AUTUMN SALES OF ESTATES, Investments, Town, Suburban, and Country Houses, Business Premises, Building Land, Ground Rents, Advowsons, Reversions, Stocks, Shares, and other Properties will be held at the Auction Mart, Tokenhouse-yard, near the Bank of England, in the City of London, as follows:—
Tuesday, Oct. 25. Tuesday, Nov. 22.
Tuesday, Nov. 1. Tuesday, Dec. 6.
Tuesday, Nov. 15.
By arrangement, Auctions can also be held on other days in town or country. Messrs. Debenham, Tewson, Farmer, and Bridgewater undertake Sales and Valuations for Probate and other purposes of Furniture, Pictures, Farming Stock, Timber, &c.
Detailed Lists of Investments, Estates, Sporting Quarters, Residences, Shops, and Business Premises, to be Let or Sold by private contract, are published on the 1st of each month, and can be obtained of Messrs. DEBENHAM, TEWSON, FARMER, and BRIDGEWATER, Estate Agents, Surveyors, and Valuers, 80, Cheapside, London, E.C. Telephone No. 503, Bank.

R. I. B. A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Mr. W. BURCH HOWGATE, A.R.I.B.A., Perchard House, 9, Gower-street, W.C. (close to the British Museum).

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

R. I. B. A., SOCIETY OF ARCHITECTS, and CIVIL SERVICE TECHNICAL EXAMINATIONS. Preparation by correspondence, in residence, or personally.—MIDDLETON and CARDEN, 19, Craven-street, Strand, W.C.

PLANS, SPECIFICATIONS, QUANTITIES, &c., carefully prepared by young Architect. Moderate terms to those about to build.—ARTISTIC, 1, Vest-terrace, Whithy. 10

ASSOCIATION OF DESIGNERS.

Offices: 20, JOHN STREET, ADELPHI, W.C.

APPOINTMENTS VACANT.
The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

JOINERS WANTED.—Three or Four Good Men for a Permanency.—W. SINDALL, Builder, Mill-lane, Cambridge. 1
MASONS.—Constancy for steady, reliable, all-round Man; country yard near London; neat workman indispensable; good wages.—Box No. 863, Office of BUILDERS' JOURNAL. 3

TRACING and TYPE-WRITING.—VACANCIES for pupils in well-established Office. Gentlemen only.—Box 837, BUILDERS' JOURNAL Office. 1
WANTED, SURVEYOR'S JUNIOR ASSISTANTS, who are competent to abstract and bill.—Apply by letter, stating age, experience, and salary, and enclosing copies of testimonials, to Box 233, Willing's Advertisement Offices, 125, Strand, W.C. 1

ELECTRICIAN and ENGINEER REQUIRED by Mr. Jeremiah Colman, at Gatton Park. Competent to take charge of electric lighting and plant and a 25 h.p. gas engine. Able to use anvil and execute repairs to ironwork. Preference given to a man who can shoe horses. Unexceptional references for respectability and competency.—Apply (letter only), C. TREVOR WHEELER, Esq., Agent, Gatton Park, Surrey. 1
WANTED, Architectural DRAUGHTSMAN for Land Agent and Surveyor's Office.—Apply, with salary and references, to "Country," Office of this paper. 2
TO JOINERS.—WANTED, Two first-class BENCH HANDS; wages 8d.; country shop; constant employment on good work.—Steady, respectable men please apply to GREGORY BROS., Builders, Anthony's, Woking. 1

ASSISTANT (first-class) WANTED in a leading City Architect's Office. Thoroughly competent in all branches. Preference to one used to public-house work.—Write first to HERBERT KNIGHT, 75, Aldermanbury, E.C.
GENERAL ASSISTANT WANTED. Usual qualifications, surveying, levelling, &c.—Apply, by letter, to W. WATKINS and SON, Architects, Lincoln.
ARCHITECT'S ASSISTANT (duly qualified) WANTED at once. Must be a neat and artistic draughtsman, and well up in construction.—Apply by letter, stating age and qualifications, and salary required, to ARCHITECT, care of J. W. Waddington, Stationer, Silver-street, Hull.

BUILDER'S ASSISTANT WANTED at once in a Jobbing Business. Must be practical and experienced. Well up in setting-out, measuring-up, and superintending work. Have good command of men.—State, age, references, and salary required, to W. BARRETT, Builder and Decorator, 65 and 67, Myddleton-road, Bowes Park, N.

APPOINTMENTS WANTED.
YOUNG ARCHITECT, A.R.I.B.A., DESIRES TO ASSIST others in the PREPARATION OF DRAWINGS at his own office.
G. SCOREE, 23, Newman-street, W.

PERSPECTIVES.
MR. E. B. LAMB, No. 31, Craven-street, Charing Cross, W.C.

MODELLER and CARVER desires RE-ENGAGEMENT. Well up in figure and ornament.—Address, A. M., BUILDERS' JOURNAL Office. 2

TO ARCHITECTS and BUILDERS.—Qualified Assistant, with spare time, renders assistance in the preparation of plans, details, inking in, and tracings for Architects.—80, Denmark-road, Manchester. 2
SHOP FOREMAN or STAIRCASE BUILDER seeks RE-ENGAGEMENT. Well up in all classes of hardwood fittings. First-class references from last employers. Strictly sober.—G. W., 268, Milkwood-road, Herne Hill, Brixton. 3

ARCHITECT'S JUNIOR ASSISTANT (20) desires RE-ENGAGEMENT. Good references. Four years' experience in good work. Neat and quick draughtsman. Probationer. Salary, 23s.—P. C. POLLEY, Effingham House, Arundel-street, W.C.

ARCHITECT and SURVEYOR'S JUNIOR ASSISTANT desires an APPOINTMENT in or near London. Four years' experience. Capable of preparing plans from rough sketches.—"M., The Limes, Earlsbrook-road, Earlswood.
BUILDER'S CLERK and ASSISTANT.—Measuring, quantities, estimating, and general routine. Used to superintending works in progress. Aged 27. Wages £2.—"M. H., 17, St. Phillip's-road, Dalston, N.E.

AN ARCHITECT of twenty-five years' experience desires a RE-ENGAGEMENT as CONFIDENTIAL ASSISTANT in London. Varied knowledge of Architecture, iron and steel work, valuations, &c.—"P., 6, Kelvin-road, Highbury Park, N.
TO BUILDERS, DECORATORS, and PROPERTY OWNERS.—WORK REQUIRED by Two practical Men, having had fifteen years' first-class experience in all kinds of house decorating, and guarantee to carry out the work to the satisfaction of the surveyor; good testimonials and references; estimates given; distance no object—Apply, W. BARKER, 7, Cecil-road, South Wimbledon. 3

The Blue Bird at Manchester.

You will remember my perch in the middle of the Art Gallery?—

not that I have been able to do much roosting since the Arts and Crafts Exhibition began; but it is the privilege of a decorative bird to stand still and hear all that goes on around him even while he appears to be in full flight. Consequently I have been a good deal amused at what has been said about me and my companions in exile by the people of Manchester during the few weeks we have been on view. I have said "in exile," because, however carefully you may arrange me on the wall, I cannot possibly feel at home, or look natural, out of the place for which my creator designed me when he poured cobalt on my tail and wing-feathers and dubbed me *Panel in Leaded Glass*. The first day was called Press Day, by which was meant that the people who write newspapers might come and see us without having their judgment biased by other visitors who knew more than they. I learned this from the wild ducks at No. 71, to whose receptions the pressmen thronged, crying, "Hullo! Louis de Rougemont's wombats again!" This was the only remark I heard them make; for they did not trouble themselves much about the exhibits, being fully occupied with jokes of their own. I had always imagined a journalist to be someone with a searching eye and a long note-book in which he scribbled hurriedly all the time. But these persons were quite sociable and leisurely, and seemed to be enjoying themselves very much. I really thought they were laughing at us, and preparing witty comments on our appearance; when suddenly they all went out together with one accord, and when they came back they were more cheerful than ever. The visitors who took most notice of us afterwards were generally the young; especially one serious couple who plodded through the catalogue making a vain list of what they wished they could afford to buy. They were a good deal worried at No. 145. "Piccolomini!" exclaimed the man in a tone that made it sound like Italian profanity—"what a name for a wall-paper! Why the—why on earth can't they call it something like the pattern, and give you a name to remember it by?" The girl, however, was by this time sighing with delighted envy over a bedstead, not seeing at first the inscription on it—*Great men have ever loved repose*. When these words caught her attention she turned away, saying severely—"Now, I should like to know what time a man who has that written over his head gets down to break-

fast!" Then there came some of those careful souls who think all beautiful things ought to be kept for ornament and not for use—that it is better to have ugly things for daily wear, so that it doesn't matter about spoiling them. There was a lady from Oldham, for instance, who felt quite sorry that such a lovely grille as No. 65 should be used for cooking steaks. But the most amusing people who came to see us were the artists themselves. None of those whose work was exhibited ever betrayed any pleasure or surprise. Several who came were sad because their work was not on view; others

much for the Guild. Robinson, I gathered presently, was not exhibiting this year. Of course he had plenty of good work going, but he did not care to send it in. Anybody could see (he said as he passed me) that the whole show was simply got up for the glorification of Smith and Co.; it was in no way representative of the Manchester craftsmen. He himself had not come to see the exhibition; he merely looked in to see who was there. Then he sat down and counted Smith's exhibits, and multiplied them by something else, and divided the total by the number of members in the Guild, until he had got a kind of rule-of-three sum. I

The Moncada Tomb.
Cloister of Santa Cruz

SKETCH AT A SPANISH MONASTERY: BY F. HAMILTON JACKSON, R.B.A.

were equally sad because it was there. These latter gave the most curious reasons for their chagrin. A man named Brown said in a tone of aggrieved resignation that he wouldn't have minded his stuff being shoved away in a corner, but he really didn't think they need have hung him next to Jones. I felt rather sorry for Brown in being associated with such an inferior person, until Jones came round an hour later and explained quite clearly that Brown was not a craftsman at all, and had only got in because he was a friend of Robinson's and had done so

followed him as far as the question—"If Smith sends twenty-seven exhibits, what price the reputation of Jones?"—when I was disturbed by an old lady who nearly backed into me in trying to get a good view of a frieze representing the Garden of Eden on the other side of the room. She thought that, as portraits of Mr. and Mrs. Robinson, the figures of Adam and Eve were simply charming, only she could not help wishing they had been painted in fancy dress. As for me, I wondered whether the birds of Paradise ever grumbled because the whole creation was a cheap advertisement for Adam.

E. W.

AT THE A.A. CONVERSAZIONE.

BY A SPECIAL CORRESPONDENT.

ON Friday evening last the great King's Hall of the Holborn Restaurant and adjoining suites were given over to the members of the Architectural Association, who filled the large rooms, and the yearly *conversazione* was consummated with more brightness and *eclat*, and with a larger aggregate of the ladies, than usually marks these functions. The Hall was pleasantly furnished to form a most agreeable lounge, and besides the prize drawings produced in the Association classes during the past session, there was an exhibition of characteristic work by such well-known artists as Messrs. A. H. Haig, A. W. Weedon, and Wyke Bayliss. Besides the architectural drawings to enable members to talk shop with point and some show of gracefulness, there was an orchestra to provoke conversation, coffee to keep people awake, more solid refreshments to make them glad they were alive, and a smoking-room and lots of quiet corners for those who should wish to yawn. The *conversazione* justifies itself from year to year in many ways. It gives its twelve or fourteen hundred members an opportunity of making the personal acquaintance of their new president under the most graceful and propitious circumstances, and it forms a happy occasion upon which the members may meet old friends and compare notes before entering upon a new year of professional activity—for the architect's New Year's Day falls somewhere in the autumn, when he is newly refreshed by his holiday and swelled with energy and huge intentions for the next twelve months. It is, indeed, the occasion of a sort of social stocktaking, when a man may learn who has fallen down a crevasse in the Alps (if anyone has), and who, if any, has married a duchess.

At eight o'clock the new President, Mr. George H. Fellowes Prynne, accompanied by Mrs. Prynne, began to receive the members and the many guests, and by nine o'clock the hall was well filled, the music in full swing, and a hum of conversation, punctuated by the more strenuous "How d'ye do's?" of meeting friends, filled the air. From time to time these sounds ceased at the claims of Messrs. May, Ellis, Dixey, and Charrington, gleesingers of considerable attainments, who sang from the music gallery. It may have been owing to their high position under the roof that the curious, blatant notes of the alto singer, wandered about alone under the wide arched ceiling in a distressed manner, like captive, birds trying to get out. The King's Hall has, like many another building designed with a view to public occasions, refuted the acoustic theories of its designer, and has been strung with wires midway between floor and roof like a harp.

It was apparently upon the subject of the roof that the President long held the attention of Sir Edward Clarke, who was one of the guests of the evening, but whether or not he was discussing its acoustic properties did not seem clear. Personally, from the great interest which Sir Edward manifested in this topic, one is inclined to think that Mr Prynne was trying to formulate the ventilating principles of the King's Hall. It would have been satisfactory to have heard what he had to say upon a matter, which one had oneself puzzled over. The fact is that though the King's Hall has now been built several years, the air in it, although of necessity partly vitiated by the workmen who finished the interior, and the many who have visited it since, is still endurable and will sustain animal life for a few hours. This would incline to show that it is practically impossible to hermetically seal up a hall of the size and uses of this one in an efficient manner. The mere fact of the doors having to be left open for the ingress and egress of a number of people makes the exclusion of a certain small

quantity of fresh air, in spite of all the precautions taken by the management of the King's Hall to the contrary, well nigh impossible; and anyone who has noticed the speed with which the ordinary waiter walks, will realise that every time one of them whisks through a doorway, he must occasion an appreciable in or out current of air, and this alone is quite sufficient to stultify all the precautions that have been taken to preserve the original atmosphere of the building intact as at the time it was roofed in.

But although on Friday the reminiscences of dining and smoke rooms, and the heavy air was certainly unfortunate, it did not detract from the success of the evening. It is religiously the custom to designate the President of the Architectural Association upon all public occasions the "Genial President;" and this is unfortunate, for it has robbed the word of its full distinction, and it becomes hyperbolic when applied to Mr. Fellowes Prynne; for he is a genial president, and for hearty generosity of manner he is second in popularity to none of his predecessors. At the annual dinner of the A.A. in the early summer, Mr. Banister F. Fletcher, in an impromptu post-prandial speech, said: "For Prynne is a jolly good fellow," and everyone cried out, "Hear hear!" for he had hit upon one of the President's best appreciated characteristics. Thus the general briskness of Friday's *conversazione* was a thing that might have been foretold. A number of well-known men came to shake hands with the President and offer their congratulations. The late president and hon. treasurer, Mr. Hampden W. Pratt, was duly in attendance to see his successor safely ensconced in the office, and Mr. Brydon, Mr. Brooks, Mr. Mountford, and Mr. Edwin Hall all honoured the occasion, while Mr. Beresford Pite and Mr. Thomas Blashill might have been seen in absorbing converse—"a dragging together of the poles of the universe," to quote from one of Emerson's essays. Among others present were Messrs. Leonard Stokes, E. J. May, Goldsmith, F. W. Pomeroy (whose paper on "Modelling as applied to Architecture," which is to be read this session, is looked forward to with much interest), and Messrs. Millard, Baggallay, Searls Wood, and many others. The success of the evening endorsed the action of the Association in returning to the old *régime*, and withdrawing from the experiment of last year when the operetta by Mr. F. D. Clapham and Mr. Leonard Butler formed so popular a feature of the evening that the members and their friends had scant opportunity to renew old acquaintances or to cultivate that of their president. On Friday evening there was nothing to show that a fuller programme of entertainments would have been desirable, and the general brightness was praiseworthy in the extreme.

A late correspondent to the BUILDERS' JOURNAL remarked that Architecture must surely be the worst paid of all the professions, and it was a remarkable sight to see all these men, hard at work, professionally, to starve each other and competing among themselves by thirties and forties for the chance of earning a couple of hundred pounds, still conversing on easy and unconstrained terms of relationship.

THE contract for rebuilding the Seaborne Coal Wharf at Bermondsey Wall, S.E., from the designs of Mr. Henry Adams, M.Inst.C.E., has been let to Messrs. Holliday and Greenwood, of Loughborough Park Works, Brixton.

THE Wesleyan scheme for raising 1,000,000 guineas to advance evangelisation has for one of its objects the erection of a palatial pile of buildings near Charing Cross. In addition to a variety of offices and meeting houses, the new block will have a vast hall to seat three or four thousand persons.

A NEW British School has been erected in Vincent's Lane, Dorking. The building, which provides accommodation for 400 boys and girls—a number in excess of present attendance—has been erected by Messrs. Colls and Sons, of Dorking and London; from the plans of Messrs. Balfour and Turner, architects, Buckingham Street, W.C.

THE SOCIETY OF ARCHITECTS' EXAMINATION.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In his note under this heading in last week's issue, "G.A.T.M." has attempted to justify the "new and eminently useful phase of existence" entered upon by the Society of Architects, by stating that ever since the R.I.B.A. instituted its scheme of examination, &c., there has been a demand for a single qualifying examination, and truly states that there are many competent men, willing to study and anxious to possess an examination diploma, who have not the time at their disposal to go through the whole Institute course. It is just here, he declares, that "The Society" has come in, and without conflict with the older body, provides a diploma for those who are unable to give up several years to study.

It may be presumed that "G.A.T.M." is himself a member of the older body, as an A.R.I.B.A., and as such should have been well aware that the examination scheme of the Institute expressly provides, by a single examination, for the requirements of those for whose relief it is suggested that "The Society's" examination is so valuable.

If "G.A.T.M." will refer to the R.I.B.A. Kalendar, 1897-98, p. 270, he will find full particulars of "The Special Examination" to qualify for candidature as Associate R.I.B.A.—whereby architects in practice, not less than twenty-five years of age, and chief assistants over thirty years of age, can be exempted by the Council from passing "the preliminary and intermediate examinations," and from sending in "testimonies of study," and be admitted to the final examination, which is conducted with especial regard to the requirements of such architects, their professional work and position being duly taken into account by the Board of Examiners.

The special examination so completely meets all reasonable requirements of those who may not have had the opportunity of taking advantage of the full course of study involved in preparation for, and in passing the full series of the progressive examinations, that the new examination, started by the Society of Architects, appears to be entirely superfluous, and to be in direct conflict with that of the "older body."

The efforts made by the R.I.B.A. to raise the standard of architectural education have wrought so much good that the establishment of other examinations professing to aim at a like result cannot but be regretted, the more so when attempted to be justified by ignoring the special provision made by the Institute to meet admitted difficulties.—I am, Sir, yours faithfully,

ARTHUR CATES.

Oct. 20, 1898.

THE Church of St. Anne, Duddeston, which early in the present year was restored, has now been provided with a new organ.

SOME newly-completed business premises at Consett collapsed last week owing to the heavy rains. The structure was completely wrecked, but fortunately nobody was injured. The damage was considerable.

A FINE chancel screen has just been placed in the ancient and interesting old church at Bebbington. It is from the design of Mr. Charles E. Deacon, architect, of Liverpool, and is made of oak. The finely moulded pinnacled posts enclose a wealth of tracery and carving, consisting of five arcades, above which, in a boldly moulded cornice, are the crisply cut cornices of foliage, containing shields with emblems of the Passion and other sacred signs. A pierced ornamented cresting surmounts the cornice, above which rises a beautifully carved cross. The work has been carried out from Mr. Deacon's designs by Messrs. Harry Hems and Sons.

SPAIN: Its Picturesque Cities and Monasteries.

V.—THE MONASTERY OF SANTAS CREUS.

By F. HAMILTON JACKSON, R.B.A.

THE monastery of Santas Creus is situated in the municipal district of Aigua Murcia, and is 28 kilometers from Tarragona and 29 from Vendrell, being enclosed in an extensive and very fertile valley which, is covered with farms, and has at its extremities towns of some importance, such as Vilarrodona and Pont de Armentara. Placed upon a little hill, its lands are defined by the river Gayá, which flows from Santa Coloma through the

which ply for hire between that town and Vilarrodona, from which place it is best to go on foot; partly because the views are beautiful and it is pleasant to linger on the way to observe them, and partly because the road is scarcely practicable now for wheeled vehicles. Between Santas Creus and Pont de Armentara there is a fine bridge across the river Gayá, consisting of a single well-proportioned arch, which was built in 1549 by the then Abbot. It is therefore to be supposed that at that date most of the traffic to and from the monastery, which is one of the most celebrated of those belonging to the Cistercian order, was carried on from that direction.

The monastery consists, as is usual, of an external and internal cloister, the word being here used to denote the groups of buildings within the exterior and interior walls respectively. In the external cloister were the dwellings of the Abbot and of those monks who were exempt from the strict monastic life, either from their dignity or from their great services and their duties, such as the vicar and the porter, the treasurer, the doctor,

on one side, and smithy on the other, and is closed by two thick wooden door leaves which turn on pivots. On the east side of the plaza is a low wall, allowing the extensive panorama of the plain bounded by hills to be seen. Facing the entrance gateway is the Church of St. Lucia, the parish church of Aigua Murcia, which has been served by the monks for centuries. It is now, however, a building of baroque style, not calling for notice. At the left of it, facing the low wall, is the great gate which gives access to the second plaza. It also is baroque, and forming part of the same building is the house of the vicar of St. Lucia, who was always a monk in the old days. An octagonal watch tower rises close by. The rest of the buildings in the plaza consist of houses for farm labourers and servants, together with stables, cart hovels, and other agricultural offices.

Passing through the gateway we enter an avenue of large trees which runs down the centre of a long plaza, the houses surrounding which are for the most part three stories high. On the right we come first to the Abbot's

A Corner of the Cloister
Santas Creus

SKETCH AT A SPANISH MONASTERY: BY F. HAMILTON JACKSON, R.B.A.

plain to Altafulla, near which town it falls into the sea. The principal industry of the inhabitants of the plain is the cultivation of the vine, though many other agricultural products add to their wealth. Santas Creus is about equally distant from Pont de Armentara and Vilarrodona (about 4 kilometers), but it is with the latter that communication is now least difficult. To get there from either Tarragona or Barcelona one takes train to Valls and then one of the carriages

and the apothecary, the masons, and other workmen. In the internal cloister lived the monks and their servants whose acts were governed by the strict Cistercian rule. In the external cloister are two plazas, the first of which is immediately within the outermost gate. This gate is quite simple and plain in construction, and bears no ornament beyond a little shield with the arms of the monastery carved upon the keystone. It is flanked by two buildings which served as porter's lodge

palace, now occupied as the town hall of the municipal district of Aigua Murcia. It was constructed in 1562, but the courtyard with its central well may have belonged to another building, the low pointed arches and the shape of the capitals looking quite a century earlier. The rest of the palace is ordinary though spacious and well planned, and is occupied by the county court offices and the public schools for both boys and girls, together with the professor's rooms. The houses around

MONASTERY OF SANTAS CREUS: THE MOST ANCIENT CLOISTER.

this plaza have been occupied as private dwellings ever since the departure of the monks, and are not noteworthy. Beyond the Abbot's palace were the bursary, the guest house, the estate offices of the monastery, the houses of the doctor and the apothecary, and the dwellings of the freed monks on the left side. In the centre of the plaza, in front of the Abbot's palace, is a very good Renaissance fountain crowned with a mutilated statue of S. Bernard. It was erected by the monks, and still affords a good supply of drinking water to the inhabitants. The further side of the plaza is occupied by the church and the wall of the internal cloister. Facing down the Plaza Mayor, so that it may be seen through the gateway rising above a flight of seven broad steps which conducts to a terrace in front of it, is the church. It is a battlemented, castellated looking edifice, and in the nave wall are a large traceried window thrown back from the wall surface a good deal, with moulded jambs, and a round headed doorway, also richly moulded and shafted, the detail of which is Gothic of the 14th century. In the aisles are two little windows, and at each side of the doorway a few sunken panels with cusped heads, a form of enrichment which also appears in a sort of frieze which is placed below the battlements. The façade is about 68ft. high by 83ft. broad. The window and door are two centuries later than the rest of the façade. The two-leaved door itself is baroque, the panels are carved out of the solid and strengthened with iron nails and clamps. The general style of the church is Early Pointed of the 12th century, say rather "transitional." The plan is that of a Latin cross, the central nave being nearly 28ft. broad between the piers, and the aisles about 15ft. each. It is Romanesque up to the springing of the arches, above which point the arches and mouldings affect the Early Gothic forms, the vaulting being quadripartite with moulded ribs. The principal light comes from the great west window and from a fine Romanesque rose high up in the eastern wall, but there are also some narrow lateral windows of early date. The nave arcade consists of six rectangular piers. The length of the nave from the apse to the western wall is about 217ft., and the transepts are 120ft. across. As originally planned there

were but four chapels, but in later days the monks increased the number to twelve, utilizing the spaces between the nave piers behind the *trascoro*. The altars are horrible things, quite at variance with the severe design of the old work. The high altar, too, was put up in 1646. It is unnecessary to say more. In the end of the north transept is a door opening out into the monk's cemetery; in the south is the entrance to the spacious sacristy, a later addition. In one of its divisions, intended for a lavatory, is a decorated fountain which is worth noticing. In this transept is also a flight of stairs 7ft. 6in. wide, which formed a direct communication between the church and the dormitory of the younger monks. The choir occupied the three bays of the nave westward from the crossing. It contained a magnificent organ and finely carved stalls, which were destroyed in 1835, being wantonly set fire to by a French detachment which was on its way from Argol to destroy the castle of Querol. According to the chronicles of the monastery the foundations of the church were laid in the year 1174, and the building was completed in 1411.

Various kings and great people contributed largely to the funds, the greatest benefactors being the Queen Dona Petronilla of Aragon, and her descendants the Kings Don Alfonso, the Chaste, and Don Jaime II., the Just.

In 1211 enough was built and covered in to be consecrated and used, the rest of the work being proceeded with as funds came in, as is clearly shown by the differences of style between the apse and the western façade.

Between the door of the church and the Puerta Real, by which one enters the principal cloister, is an enclosure dedicated to the game of "Pelota," one side of which is formed by the cloister wall, while the wall of the church is used to strike the ball against. The monks of Poblet also had their enclosure for playing the same game (of which the Catalonians are passionately fond), but their court was quite in the interior of the buildings. It must have been a sight to see men in monk's garb playing a game which requires so much agility and skill! The Puerta Real is of the same date and character as that of the church, a round arch with mouldings of a later character with delicate shafting at the sides, and two

empty niches which once held statues of the founders Don James II. of Aragon and his wife Blanche of Anjou, standing upon a base of sunk panel with traceried heads which contain coats of arms. On the keystone and some of the vousoirs are cut the shield of James II. of Aragon with the Catalan bars, and that of his wife Blanche of Anjou with *fleurs-de-lis*. It still retains the ancient iron work. It is evident that it was intended that both these doors should be protected by porches, the first row of mouldings and other stones being still in position.

The cloister, which we enter through this door, is the most beautiful thing in the monastery. It is Gothic of the 14th century, having been built between the years 1313 and 1341, in which latter year it was blessed by the Abbot Francisco Miro. The cost of this cloister was borne by the king and queen, and the escutcheons of these monarchs appear, alternating with that of the Abbot Don Pedro Alegre, under whom the work was commenced, in many of the capitals and central bosses of the vaulting. It is in plan a rectangle, 120ft. long by 106ft. broad. The walks are 13ft. broad, and 20ft. high from the pavement to the lower portion of the keystone of the vaulting. The walls are 18in. thick. On the north and south sides there are eight bays, on the east and west but seven. The traceries are different in each of the ambulatories, all being of the Second Pointed period. The capitals are of two kinds, one of which, executed with the greatest dexterity, represents generally grapes and other fruits, leaves and flowering plants cut in very high relief, and almost as if the plants themselves were fastened to the stone. The other sort is not so well carved, and for the most part represents human beings and mythological creations. The columns are slender and well grouped, and the mouldings of excellent style. The stone used is a fine sort of sand stone, which is sufficiently hard and homogeneous to allow of the most delicate carving being executed in it. Yet it has weathered so much in some places that in the western side but three arches are perfectly preserved, while two of the others have lost their tracery altogether, the remaining two being much damaged. On the south there is one which is quite ruined,

while the other six are well enough preserved, but on the north and east the work was in such a bad state at the end of the last century that columns and traceries had to be taken down bit by bit. Within the cloister garth, and communicating with the southern walk, is an edifice called "El Templete," a Romanesque building, hexagonal in plan, with coupled round arches under others which are slightly pointed, which contains a marble fountain which pours water from a number of vents into a large stone basin with a pleasant murmur sounding through the surrounding stillness. There is no doubt that this interesting little building is contemporary with the church, and in the wall of the cloister on that side are to be seen indubitable signs that an older cloister once stood on the ground now occupied by that of the 14th century.

The priory was entered from a doorway, now closed, facing the entrance to the "templete." On the ground floor may be seen the commencement of a large refectory, which was never completed. In the centre of the east side of the cloister is the Chapter House. It is a chamber about 36ft. square, the vaulted roof of which is supported by four slender columns with carved capitals, and is lighted by two windows at the sides of the doorway, with which they group. They are much like the arches of the "templete" in shape, but are richly moulded, and the capitals more delicately carved. Round the walls are remains of a stone bench. In this eastern walk are four other archways, the one farthest from the church giving entrance to the chapel of St. Benedict—the next serving as "locutorio" (talking-place), for the young monks, and also as passage-way to the older cloister and various offices belonging to the monastery. It has stone seats running down its sides. The next arch leads to the monk's dormitory by way of a staircase in the wall, and the fourth, that nearest the church, gives entrance to a little chapel once dedicated to St. Martin, and afterwards to Our Lady of the Assumption, which is thought to have been the library at one time, books belonging to the Chapter being required by the Cistercian rule to be kept "between the church and the Chapter House." It is now used to store remains of sculpture found among the ruins. The cloister contains numbers of tombs which it will be most convenient to speak of when describing the monuments generally.

Through the "locutorio" one arrives at the Ancient Cloister, which is nearly 120ft. long by 80ft. broad. The arcades are very unusual in shape, the pointed arches springing practically from the ground. They have slightly moulded edges, and are five in number the short way, the longer sides having eight; they were constructed in 1163. Nothing remains of this early structure but the arcade, the vaults and the original roofs having perished. Turning sharply to the right on entering the cloister one comes to the cellar and winepress, which back on to the priory. The cellar is 50ft. long by 35ft. broad, and is late Romanesque in style, with two pillars in the centre line from which six bays of vaulting spring. It still contains two ancient cylindrical casks used by the monks. The winepress is entered from the cellar, and is roofed by nine pointed arches springing from corbels supporting a barrel vault; it is 75ft. by 35ft. In the same corner is the prison tower, which fills the space by the side of the cellar, making a rectangle with it and the winepress. The upper part of it was used as a watch tower. Following round the cloister are ruined buildings which were used as kitchens and the dwelling of the monk who was "universal provider" for the community; and next comes the refectory, which is 57ft. long and 23ft. broad. The walls of this room are covered with tiles almost as high as a man's head, and it is roofed with a great elliptical vault divided into four compartments by three cross arches. Tall windows light it, and it contains a modest pulpit for the reader. A small window communicates with the kitchen. The building of this refectory commenced in 1302, and was not ended till 1613, which accounts for the incongruous features which one finds in it.

(To be continued.)

The "Bitter Cry" of the Outcast Architectural Assistant.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The letter signed "A.R.I.B.A.," in your issue of the 19th inst., is, I presume, an appeal to the Profession and the world at large, inducing them to use their generous offices in bettering the lot of the unhappy architect's assistant.

What can be done to raise the status and remuneration of the much neglected draughtsman? While sympathising with the truth of "A.R.I.B.A.'s" remarks, no exposure of his wrongs and insufficiently recognised services will, I fear, do anything towards the mitigation of his lot.

While not admitting any bias towards registration, my opinion is that, were entry into the Profession made more stringent, as in the case of the legal profession, a large percentage of youthful aspirants would be saved the disappointments and altogether inadequate recognition which is the lot of ninety-nine out of a hundred assistants. If architects were more insistent on the elementary educational attainments of prospective pupils and their fitness for the work, they would do more towards removing the stigma than the talk of a lifetime. It is a fact that great numbers of pupils (I am sorry to say the provincial

members err most in this respect) on entering an office are incapable of ordinary elementary scholarship.

There is not one assistant in ten worthy of the name who possesses the natural bent, or talent, and perseverance essential to a modicum of success in this most hard-worked and brow-beaten of professions.

If parents and youthful aspirants to the Profession would only look before they leap, many badly-chosen careers would be arrested before it is too late.

Should the Registration of Architects Bill become law, one good result would ensue; a better and more suitable class of pupils would enter the ranks of the Profession when certain that the reward of their long and severe training would be the social status and universal recognition which should befit the Profession in all its ranks.

It is well known that a great many would-be architects, nowadays, are recruited from amongst the failures of the other professions; this, and the other facts stated, are almost entirely accountable for the congested and much despised lot of the architectural assistant.—I am, Sir, faithfully yours,

"ONE OF THEM."

MONASTERY OF SANTAS CREUS! ENTRANCE TO THE CHAPTER HOUSE,

THE ARCHITECTURAL ASSOCIATION MEDAL: SECOND AWARD. PLAN OF CONVALESCENT HOME. BY T. TYRWHITT.

(See Inset Supplement for perspective view.)

Prize Designs and Drawings at the A.A.

BY OUR OWN CRITIC.

ON Friday, the 7th inst., that being the occasion of the inauguration meeting of the new session of the Architectural Association, and presidential address, the President, Mr. George H. Fellowes Prynne, presented the prize-winners of the past session with the medals, books, and certificates which are annually distributed to those students who distinguish themselves in the work of the classes and studio, or who succeed in those other special subjects for which prizes are awarded. It is a great pity that the excellence of these classes is not more widely known. Unlike other schools of Architecture in London, advertisement is no policy of the Architectural Association, which is content to let its educational curriculum remain supplementary to the social and professional advantages which have always constituted its chief claims to popularity, by introducing the would-be architect into the inner circle of professional life and affairs. At the same time, our attention is never called to the educational opportunities offered to its members by the Architectural Association, but we are struck by the excellent and thorough practical discipline of its methods throughout. The curriculum is concerned alone with the education of "architects," in the strictest sense of the word, and accordingly this end is accomplished with a more direct attention to the essential training of an architect than in institutions where the needs of the wider application of architectural knowledge in the trades, has also to be considered. It is, too, generally overlooked that the great activity in architectural education which has arisen in the last few years is in the main due to the initiative step taken by this Association when it instituted the curriculum of education which has become so popular with the Profession.

The prize which has called for the closest competition, and produced the soundest and most valuable work, is the Association medal,

which is each year given to the author of the best design for some building, the particulars and requirements of which are published at the beginning of each session. This prize, which is, perhaps, first favourite in popularity, and always attracts a great deal of attention, has this year produced nine sets of drawings of varying merit, and, in view of the somewhat technical nature of the subject, and the large number of drawings required, the exhibition must be considered a most satisfactory one. The subject, "A Convalescent Home on the South Coast," asked accommodation for ten men, ten women, and fifteen children, and the requirements included day rooms for each sex, play room and covered play shed for children, a small chapel with accommodation for twenty-five strangers, beside inmates and staff, and various other essentials of the plan were specified. The drawings required included eighth scale plans, elevation, and sections, a half-inch detail, and a perspective. Of the nine competitors the designs of two, as stated in a previous issue, are of such equal merit that the award has been divided; "Ægris Solatium," Mr F. D. Clapham gaining the silver medal, and dividing the ten guinea prize with "Leander," Mr T. Tyrwhitt, the author of the measured drawings of Clare College, Cambridge, for which the Institute medal was last year awarded. A comparison of these two designs shows that while that of the winner of the medal has recommended itself for its elevation, its rival has claimed recognition mainly for excellence of plan. Mr. Clapham has achieved a picturesque rugged group of stone buildings of a somewhat archaic description, altogether very forcible and unconventional, and he has shown this in a perspective drawing in sepia and colour, which is the best in the room, and which is drawn with a great deal of vigour, and reveals a strong individuality. These results, however, have been attained only by making certain sacrifices in the plan which are not lightly to be overlooked in a building which requires a rigidly scientific treatment, if it is to fulfil its various needs efficiently and well. We notice that Mr Clapham has only one staircase, and one entrance to and from the grounds, an oversight which is hardly excusable when the

separation of the sexes is demanded in the requirements, and otherwise fulfilled in the scheme of the planning. His isolation ward, in complying with the picturesque needs of his elevation, is too close to the rest of the building, and it should not have been made to flank upon the main entrance. The chapel and dining-hall, balancing each other on either side of the entrance, have been set off at a slight angle from the true frontage line, and this, although it greatly aids his design as far as externals are concerned, yet leads to inconvenience and extravagance in the plan, and scarcely seems justified in a building which is, above all, a place to restore sick people to health. If the style Mr. Clapham has adopted required such handling, he would be better advised to have chosen some other manner of design for his present subject. This plan also is at fault in having recourse to an area. The offices and servants' quarters are not sufficiently considered. There is a wealth of corridor as compared with the second award and other plans. There is no access on the first floor to the rest of the building from the servants' quarters, and the sanitary accommodation throughout is insufficient. The author has also overlooked the fact that the children would need a complete supervision; the nurse's bedroom is far removed from the children's dormitories. Mr. Tyrwhitt's plan, as we have said, is the better of the two. Its errors, such as they are, do not lie in essentials, and it has an excellence that would, we think, distinguish it in an open competition. It is eminently practical and economic, and the needs of such an institution have been admirably divined in their details, and for the most part aptly fulfilled. We notice, however, that the children's stair is reached upon the first floor through the lavatory lobby, and in order to complete the design of the main elevation to his taste, he has treated some flues in a summary manner that would hardly recommend itself in practice; for he has arched them over upon the front wall, and taken them along it and over a window before conducting them upward to the roof. His enthusiasm has also prompted him to elaborate his chapel in a manner which would rather befit a college building than a convalescent home.

Indeed, this design perhaps fails a little in that it is too collegiate in character in regard to its elevations. These are of brick with stone dressings, and show a delicate and true appreciation for the earlier Georgian methods. It has a reserve and a breadth which is very rarely met with in the work of a student. The extreme severity of the two pavilions is, however, to be regretted, more especially as the perspective view gives them an undue prominence. They do not quite succeed in the characteristic traditional key, which is otherwise maintained with such consistency throughout the drawings. The design, on the whole, shows a forethought in its particulars, and conformity to technical details, which is worthy of high praise, if only for the sound and conscientious work evinced therein, and this same quality is shown again in the minute and perhaps unnecessary elaborate drawings, and their simple and unassuming character. Mr. Tyrwhitt has been particularly happy in securing the right prospect for the several departments of his plan, his sanitary accommodation has been well thought out, the kitchen and offices are sufficient and well placed, and if his design was commissioned as it is here drawn, his client would have a thoroughly practical, economical, and convenient building.

The remaining seven designs vary a good deal, and none of them pretend to any serious rivalry with those of the successful competitors already described, but we particularly noticed the sheets submitted by "Sea Side" as showing a plan which seemed to be as good as any of those exhibited, excepting only Mr. Tyrwhitt's. The main requirements and essentials of the plan had been mastered, and the design would have probably been a favourite for first place if the elevations and the style of the drawing and perspective, had been commensurate with the merits of the plan. The drawings contributed under the motto "Rest" show a design which has some merits in the plan, but which lacks appropriateness in its elevation. The requirements of the subject have been well considered, and a lot of careful work in design and drawing is shown. It was, however, a mistake to put the chapel on the first floor in face of the requirements, which specified that accommodation should be made in the

seating for twenty-five strangers; and this objection becomes considerable through the absence of a central or main stair. The elevation has too much the air of a palace, and the row of dormer windows, though they look well, are quite unjustified by the requirements of the building. The perspective is one of the best sent in, but it would have gained a good deal if it had been more simply drawn. "Curlew's" drawing shows a most unusual mastery of his medium—lead pencil. Such effects, although no one can but admire them, are, however, unnecessary, and the error of paying such a fastidious attention to the style of presentment is in this case emphasised by a totally inappropriate elevation, and a plan which fails in nearly all particulars. If "Curlew" could have applied his knowledge to best advantage he might have done very well. "Sigurd" has submitted a perspective which shows the touch of a practised water-colourist, but otherwise we can only include his design with those of "Æolus," "X," and "Clio," who have not succeeded in at all grasping the essentials of their subject. "Clio" alone, of all the competitors, has worked upon the cubical principle. This was a mistake in itself; and he has not been successful in the difficult task of arranging them in a convenient plan.

The awards for the "Measured Drawings" and "Studio" prizes will be duly noticed in a subsequent issue.

ST. PETER'S parish, Accrington, is about to be provided with a new vicarage. Plans have been prepared by the architects, Messrs. Austin and Paley, of Lancaster.

The Council of the Society of Architects have appointed Mr. C. McArthur Butler, member, of Boscombe, to be the secretary of the Society in place of the late Mr. Montagu Baldwin, M.A.

MEMORIAL stones of the new Baptist Chapel at Ford have now been laid. The situation of the new building is in continuation of the existing chapel and schools in Alfred Road, the cost of its erection will be £2522, and when completed will provide accommodation on the ground floor for 480, and if galleries are added, for 235 more.

PLANNING.

BY ASTON WEBB, F.R.I.B.A.

AN admirable address on planning was given by Mr. Aston Webb at the opening meeting of the session of the Architectural Association School of Design. At the same meeting Mr. G. H. Fellowes Prynne gave an address, reported in our last issue, on the study of design. Mr. Aston Webb had not prepared a paper; he gave simply a few ideas which had occurred to him from time to time, illustrating his points by diagrams on the blackboard. For definite ideas and carefully thought out statements on the subject of planning, Mr. Webb referred students to papers which Mr. McVicar Anderson and Mr. Alfred Waterhouse had read before the Royal Institute of British Architects, and which were, of course, to be found in the Institute's transactions. One of the first things about planning one naturally thought of, Mr. Webb proceeded, was the placing of the building, and he was really inclined to think this was very often neglected. Nothing was more important in the erection of a building than the way it was placed on its allotted site. Of course, in London and in other great cities the opportunities for securing an effective placing of the building were frequently very limited. Here they were governed—and very properly governed—by laws of frontage and by local authorities, and there was often nothing to do but to put down their building, and start away with the inside and outside without preliminary considerations as to position. And here he would like to say that the

FIRST THING IN SUCCESSFUL PLANNING and designing—and one could not separate the plan from the design—was before putting pencil to paper to have an idea or general principle as to what they were going to do. It had often happened that men who were preparing a design for a competition, had shown it to him and asked his opinion of it. Well, of course, he thought it was extremely good, but he had often been struck by the way men were led away by what were really the trivialities

THE ARCHITECTURAL ASSOCIATION MEDAL: SECOND AWARD. PLAN OF CONVALESCENT HOME. BY T. TYRWHITT.

THE ISOLATION BLOCK

ARCHITECTURAL ASSOCIATION MEDAL: SECOND AWARD. PLAN OF ISOLATION BLOCK OF CONVALESCENT HOME. BY T. TYRWHITT.

of the design, thinking nothing of the general idea. He suggested that it was no use starting a public building or a house or any building with any capacity for design, until they had some central idea which would be readily recognised in the completed scheme. And when they sat down to make their plan they should not attempt to do it to a large scale at first. They need not trouble much in their preliminary plans as to such things as the thickness of walls, which might be represented by lines; if they had a good building they could rest assured that these things would come out right in the end. Coming back to his first point,

THE PLACING OF THE BUILDING:

it was of immense advantage to place the building at right-angles to the line of approach. It could rarely be done in London, but in domestic work it could very often be done. They all knew how effective was a house at the end of an avenue. A house standing isolated in a field was rather a poor thing however good the Architecture might be, but a house approached by an avenue, whether the house was good or bad, had some sort of effect not easily spoiled. The site of the National Gallery was called, not without exaggeration, the finest site in Europe. It was fine because it was approached up Whitehall, and the ground rose at the end. Certainly very few sites in London had this advantage. It was to be regretted, although it could not be helped, the speaker noticed in passing, that the new Government building would be parallel instead of at right-angles with Whitehall. A great point of this was made in foreign towns. There was an instance in Prague, where a recently-erected museum had been placed across the widest street of the town. The structure was rather commonplace in character, but from its position and approach it had a very imposing effect, and added very greatly to the dignity of the town. Nearer home, the Mall and Buckingham Palace afforded another instance. He had often wondered how it was the Mall had so little effect until he discovered the building was not in true centralisation with the Mall; in order to get something in the way of a central view, a row of trees had been placed in the centre of the Mall, thus dividing the avenue into two and robbing the Palace of very much of

ITS GRANDEUR AND IMPORTANCE.

As another instance, they all knew the obelisk which Lord Leighton had described as standing between two streets, marking nothing, leading to nothing, emphasizing nothing, and by nothing emphasized. The Houses of Parliament was a magnificent group, but it was regrettable that the full length could not be seen from the main approaches. The older he grew the more symmetrical he became in the matter of the arrangement of public buildings. Picturesqueness had its place in buildings of a less important character, but in erecting public and monumental buildings the dominating idea ought to be that of symmetry and grandeur. This remark applied not only to public buildings, but also to the frontage lines of streets. Regent Street

was a case in point. They all admired Regent Street as a very well laid out thoroughfare, and were very much indebted to the Crown for this, the only well laid out street of the century, though the London County Council's new street promised well. One thing Regent Street needed, however, was somewhere to lead to. A great street leading nowhere was like an avenue without a house at the end of it. It was not absolutely necessary that buildings should be in line with the street. Of course, the local authorities would not permit a building to project, but they could not prevent the architect putting one end of his building back a little. Whitechapel Church was an illustration. The architect had placed the church

AT AN ANGLE WITH THE STREET,

and anyone walking down Whitechapel would be compelled to admit that this was a happy little inspiration in varying the monotony of the terrible rows of houses in this gloomy thoroughfare. The desirability of placing the buildings at right-angles to the street applied particularly to public buildings. It was impossible to make any system of planning applicable to both private and public buildings; the two objects were absolutely different. In the internal arrangement of a public building what was primarily needed was direct access and perfect simplicity of plan, and to those about to enter a competition he would advise them to spare no time in making the means of communication as simple and plain as possible. In planning a private house simplicity was not the great consideration. It was a pleasure to a hospitable man to show his friends over his house, but if they knew the arrangements beforehand, as they did in most London houses, that pleasure was impossible. Straight corridors were essential in the planning of public buildings, broad straight corridors from the entrance with branching corridors on either side. The corridors should, of course, be properly lighted. This question had been prominently raised with the competition for the new Admiralty and War Offices, and Mr. Christian, the architect advising the Government, said he would not recommend any design that had dark corridors. The Home Office building had been much condemned on account of its dark corridors, and, no doubt, the lighting of the corridors of a public building was one of the first things to consider, as it influenced the whole design. A way of lighting corridors which was more or less new was suggested in the selected design for the new Admiralty Office, and the scheme which had been carried out answered very well. There were two corridors with rooms down the sides, the corridors being lighted by courts in the centre 25ft. wide. The disadvantage of this arrangement was that it rendered the communication between rooms on opposite sides more inconvenient than on the old system. It was not well to light corridors all the way down exactly alike. The corridor could be divided into bays, each alternate bay being lighted. Proceeding, Mr. Webb said it was much better that halls in public buildings should be entered from the side than from the

end, and, where possible, they should always be planned so as to be entered at the end. Mystery was just as important in a public building as in a private one, but it must be gained in quite a different way. It could generally be obtained in the height and arrangement of the roof; anyone who went into Westminster Hall and looked at the roof could see that. He also recommended them to consider the advantage of the mystery of the open roof in large apartments, and the increased facilities for sound which it afforded. In vaulted churches and vaulted rooms it was far more difficult to hear than where open timber roofs existed, a plaster barrel ceiling being about the worst arrangement for sound. He was strongly against putting the kitchen at the top of the house in a private building, although he thought that was the place for it when it had to be provided in a public building. In public buildings

THE STAIRCASE

should be placed at the end of a corridor, at the end of a main approach. In private houses, where the staircase only led to bedrooms, it should be put rather out of the way. He thought it almost unnecessary to utter a warning against placing rooms so that they would get no sun. Mr. Webb proceeded to offer some suggestions as to the proper placing of doors and windows in private houses, and, in concluding, alluded to the benefit he himself had received from the Architectural Association School of Design. Rudyard Kipling, in one of his poems described a happy hunting ground for artists, and went on to say:—

And only the Master shall praise us, and only the Master shall blame;
And no one shall work for money, and no one shall work for fame;
But each for the joy of the working, and each, in his separate star,
Shall draw the thing as he sees it for the God of things as they are.

This was the spirit in which they should work. This was the spirit in which he had himself worked in his student days, and it was the recollection of those student days, of the benefits he had received from the School of Design, which had prompted him to accept the President's invitation to deliver that address.

At this meeting Mr. Cole A. Adams read a short paper on the use of colour in design, emphasising how essential a factor colour was in design, and painting word-pictures of its exquisite effects.

THE premises of Messrs. Sealy, Prysers, and Walker, publishers, Dublin, have been completely destroyed by fire, and the damage is estimated at £15,000.

MR. GOSCHEN recently visited Portsea to open the new Parish Institute building, a substantial structure, capable of holding 700 people, which has been erected in the Fratton Road.

AT Rugby the Archbishop of Canterbury has unveiled a medallion portrait which has been erected in the school chapel as a memorial of the late Archbishop, who was an assistant master there at one period of his life. The medallion is the work of Mr. Bruce Joy.

THE London County Council has accepted the recommendation of the Highways Committee to consent to application being made by the London United Tramways Company to the Board of Trade for powers to reconstruct a portion of their tramway in Uxbridge Road, in accordance with the overhead trolley system, on condition that the Company also reconstruct another portion of their line on the underground system of electric traction.

SOME idea of the widespread interest which is felt by the art-loving public in the work of Sir Edward Burne-Jones may be obtained from the fact that Messrs. G. Bell and Sons have found it necessary to issue a fourth edition of the authoritative "Record and Review" of that artist's career written some few years ago by Mr. Malcolm Bell. Although the price of the volume has been reduced, the letterpress has been revised and brought up to date, and some new illustrations have been added.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
October 26th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

COMBERMERE ABBEY, an old Cheshire mansion, has a peculiar interest just now, for it was nearly associated with the latest royal victim of the anarchists, the ill-fated Empress of Austria, whose hunting feats in Cheshire, when a resident in the historic home of the Cottons, are well remembered in that district. Combermere Abbey, in which is incorporated some portion of the ancient building erected by the Cistercians hard by that fine sheet of water which is the principal feature of the domain, has been in the possession of the Cotton family since the days of Henry VIII., from whom they received the estate. It contains many interesting momentos of ancient times.

At a time when architects are writing to the papers to complain of the difficulties that lie in the way of getting good work honestly done, it is refreshing to look once more at the vigorous pages in Mr. Ruskin's "Stones of Venice," which Mr. George Allen is now re-issuing in a cheaper form. The second volume has just appeared, and if any addition were needed to the vivid description of stone and brick construction given in the first volume, it will be found in the lessons of the next two. They are peculiarly applicable to the present day, for they emphasise the truth that the builder's art depends on the moral or immoral temper of the State, just as the workman's life has every possible effect upon his work. Mr. George Allen publishes these books, which are part of a large series of reprints, in a form that is at once handy and attractive, and they deserve the large sale which their timely teaching should command. The original illustrations have all been excellently reproduced by process cuts.

THE Guildhall set the year's note for French Art. It abounded at the International Exhibition, sufficed for Mr. Obach's show, in the *raison d'être* of the current display of the New Gallery, and it rules now at 157, New Bond Street. Certain pictures from the past season's Paris Salons are there, although these are not of the typically mundane or typically sensational class which stay-at-homes believe sum up the taste of France in figure subject pictures. Nothing of the startling order is included on this occasion, as it has been sometimes by the management, who are alive to the value of a "draw." On the other hand, it would be very unfair to our clever neighbours to take this collection as a standard for quality in modern French Art. If, however, it lacks importance as a whole, and contains no one great work, refinement is to be seen in

"Amidst the Roses," by M. Aublet, powerful character painted somewhat rigidly in M. Leempoels' rather involved symbolical picture, a sufficiently good marine painting by M. Tattégren, a picture that has something more than mere traces of "style" in sun-embrowned nudes placed amidst sombre landscapes, "Automne" (that won a medal for M. Lauth), and there are instances—not perhaps their best efforts—of M. M. Chaigneau, Rixens, Schuler, Sylvestre, Berthelon, Durst, Ivill, Girardot, and other men who have been medalled at some time or another.

MR. ALLAN J. HOOK, writing to The Times, says: "The enforcement in country districts of by-laws drawn up to regulate building in towns, is a very serious evil. From a case, in itself unimportant, the effect on larger interests may be judged. Therefore the following instance is worth notice. The members of a golf club proposed to erect, on private property in the open country, more than three miles from the nearest town, an iron pavilion. The Farnham District Council refused to pass the plans on the ground that the building was to be constructed in a manner not complying with the regulations for the construction of dwelling houses—regulations affecting any building 'adapted to be used wholly or principally for human habitation,' and therefore applicable to a golf pavilion. For a time the golfers felt themselves beaten, until some one studying the map luckily discovered that the proposed site was, by a few yards, outside the boundary of the Council's jurisdiction, instead of just inside it, as had been supposed. The adjoining district being a free one, the golfers are able to shelter themselves from the rain in such fashion as they think best. It is, on the face of it, absurd to apply identical building regulations to town and country alike; but the extent of the absurdity can be realised only after reading many pages of tedious details. Perhaps the greatest absurdity of all consists in supposing that any building regulations are needed in rural districts. The good effect of restriction exists only in fancy. The harm is immense. What is urgently needed is an Act of Parliament to exempt all rural districts from the operation of building laws; in short, to make a by-law apply only to the 'by,'—that is, to the town."

A SERIOUS accident occurred during the demolition of Mazas Prison. Owing to the fall of a wall through the operations of the pickaxes and crowbars, two labourers were terribly injured. Some other workmen employed in the place were hurt less severely. Mazas, by the way, is now practically obliterated, and the navvies have now attacked Sainte-Pélagie. This is the famous Press or political prison, and was also for a time the place of incarceration of Madame de B-augharnais before she became the Empress Josephine. Béranger, Paul Louis Courier, Lamennais, and Prudhon were among the famous inmates of the establishment which was often called the Great Tomb, and also Little Siberia. The gaol of the journalists is now only tenanted by two Municipal Guards and an old turnkey. By order of the Departmental authorities, three relics, namely, an antique gate from the destroyed Bastille, a group of Seraphim and Cherubim from the sculptured work in the chapel, and the door of M. Henri Rochefort's cell, are to be preserved from the ruins of Sainte-Pélagie, and to be kept in a museum for the benefit of the present and of future generations of old curiosity worshippers.

At a recent weekly meeting of the London County Council a report of the Technical Education Board was submitted dealing with the Central School of Arts and Crafts. The report stated that two years ago the Technical Education Board established a school of Arts and Crafts in premises at 318, Regent Street, and Little Portland Street. The number of students has increased so that the capacity of the temporary premises has been severely taxed, there having been 539 individual students in attendance during last

winter. Every room in the premises is now fully occupied, and there is no room for further extensions of the work which appears desirable. The attention of the Board has been called to a building, known as Oxford Mansions, within a few yards of the existing school, the lease of which is now in the market. The building forms a block 100ft. square. The premises are held on lease from the Portland Estate, with fifty-eight years to run, at a ground rent of £560 a year. The situation is admirably adapted for the work of the school, and the extent of the premises will meet all the school requirements as far as they can be foreseen for a long time to come. An offer of the premises has been received at the sum of £35,000, subject to the acceptance by the Council in October. The Council's valuer and solicitor have been instructed to make the necessary arrangements for acquiring the lease of Oxford Mansions for a sum not exceeding £35,500, which is within the estimate made by the Council's valuer, subject to the adoption by the Council of the Board's recommendation. When the necessary alterations have been made the building will comprise thirty-three rooms, each about 33ft. square, together with a basement story, a central hall, and a number of smaller rooms for the use of the staff and of smaller classes. The architects estimate for the necessary alterations, including the installation of the electric light, amounts to £5000; and the cost of these would be defrayed by the Technical Education Board out of sums already appropriated by the Council on the estimates for the current year. The committee recommend that an expenditure not exceeding £35,750, including stamp duty and expenses, for the purchase of the leasehold property should be approved.

Two more of the panels which encircle the great hall of the Royal Exchange have been filled. The panels are the work of Mr. Seymour Lucas, R.A., and Mr. Sigismund Goetze. These panels do not lend themselves very readily to decoration—in a picture—for the upper part of them furnishes a most awkward space to fill. Mr. Seymour Lucas's painting, which pictures William the Conqueror granting a charter to some dignified and very portly representatives of the City of London, makes a most gallant attempt to overcome this difficulty by introducing a Norman pillar with springing arches into his composition. The effect is successful in overcoming the difficulty, and the composition as a whole is bold and unstrained. The colouring is bold also, a necessity of the half light in which the picture finds itself.

MR. GOETZE's picture takes for its subject the offer of the crown to Richard Duke of Gloucester by the citizens at Baynard Castle, a mansion from which one of the wards of the City takes its name. Mr. Goetze's picture is not well lighted in a different sense from that in which the words were used in speaking of Mr. Seymour Lucas's work. The composition and the lighting together have the unfortunate effect of making the heraldic lion on the balustrade of the staircase where Richard stood to receive the crown nearly the principal object in the picture. One other thing ought to be mentioned in connection with the scheme of decoration which is being carried out, and it is that the work, when complete, will be very much disfigured if the marble advertisements of insurance companies are allowed to remain on the pillars between the panels.

ONE by one of the churches of the Norwich diocese are being rescued from the neglect of past generations and restored to the beauty and dignity with which they were originally endowed by the architects of bygone centuries. Thornage was one of those churches which retained in a very marked degree the deadening impress of the Georgian era. A west gallery, blocking up a fine window and arch, a three-decker pulpit, pews of the sheep-pen type, a false ceiling in nave, a miserably inadequate altar, and liberally whitewashed walls, did all that was possible for physical surroundings to do to counteract the spiritual

beauty of the church's liturgy. But now all this has become a thing of the past. By the energy of the rector, well supported by the patron, Lord Hastings, the greater part of the fabric and interior fittings of the church have been judiciously and substantially restored.

THE work so far completed consists in the re-roofing with Broseley tiles and new ridge, finishing with stone cross. Inside the roof has been clad with pitch pine, and all decayed rafters removed. Three new buttresses have been added to chancel walls. Inside these were found (on removing plaster) to be hollow, and have consequently been rebuilt. The cleaning of the walls of whitewash brought to light the outline of two small windows, probably Anglo Saxon. These have been restored, as well as a larger one. On the east wall even some remains of fresco work have been preserved. The piscina and sedilia have been opened. The tracery of the chancel windows on south side has been found in an excellent condition. The walls have been plastered and finished with stucco. In the tower what appears like an incense place or ancient fireplace has been found. All the windows have been reglazed and given by friends of the church. The porch door, a very old one with huge lock and bar, has been well cleaned and rehung, and now there has been fixed an appropriate frame with texts, instead of

is a single figure in alabaster, which has been placed in the wall. The only other old memorials that are to be seen are slabs to the memory of former rectors, but two new brasses have been placed on the walls. The church has been restored both inside and out. There is a new roof, the walls have been re-stuccoed, new lead has been placed on the outside, the stonework of the windows has been replaced, and foundation drainage has been supplied. A fine altar table of cedar and olive has been erected. The chancel fittings and a new pulpit were supplied by Mr. R. Chapman, of Hanworth, and the seating was put in by Messrs. Cornish and Gaymer, of North Walsham. The windows were glazed by Mr. W. R. Weyer, of Norwich, and the screen and the carved figures in the roof are the work of Mr. A. Sampson, of Starston.

THE curious way in which two parishes of the City run one into another is often the subject of remark. How many, however, are aware that one building alone—11, Queen Victoria Street—is in no fewer than six parishes. There are several instances of a building being in four parishes, and at least one house is half in the City and half beyond its borders. This house affords a singular instance of the involved state of municipal affairs in that crowded square mile ruled over by the City Corporation. In that small area

THE special feature of the shops illustrated on this page will be the particular care which is to be taken to have them erected in accordance with the latest methods of fireproof construction, having particular regard to the use of wood in every possible manner, and thus reducing the use of iron to the lowest possible degree. This will certainly put to a good test this particular form of fireproof construction, of which we have read so much of late. The architect is Mr. Edwin A. Somerville.

A VERY pleasing improvement is contemplated in Queen Victoria Street, where the Church of St. Andrew-by-the-Wardrobe faces that thoroughfare. The church, rebuilt by Sir Christopher Wren after the Great Fire of London, obtains its curious name from being situated near the ancient repository of the State robes of our kings and queens, which once existed here, and still gives a name to the adjacent "Wardrobe Place." St Andrew's did not face a main thoroughfare until Queen Victoria Street was driven through a network of surrounding lanes some thirty years ago. When that change took place, a portion of the churchyard was thrown into the roadway, and the remainder walled up, as seen at present. The proposed improvement consists in removing this blank wall and placing a light ornamental iron railing in its stead, so that the churchyard may be open to view. The ground

PROPOSED SHOPS AT KENNINGTON. EDWIN A. SOMERVILLE, ARCHITECT.

a multitude of secular notices. The priests' door in the chancel has been renewed in oak. Slight remains of rood stair have been shown. The five pillars and arches have been cleaned. New floors have been provided, and the aisles paved with tiles. A very elegant pulpit in English oak, with carved panels, a new lectern, altar rail, prayer desk, choir stalls, all in oak, with the old poppy heads, will furnish the spacious chancel. The most beautiful and costly gift is that of the altar, given by Sir Alfred Jodrell, and made by Mr. Chapman of Hanworth. The credence table has been made out of one of the few oak benches found. The church is lighted with cathedral lamps. The architect has been Mr. Lacey, diocesan surveyor, and builder, Mr. Blyth of Foulsham. The porch still remains to be done, the walls externally require considerable repair, also the tower, and a vestry is much needed.

ST. MARGARET'S CHURCH, Saxlingham, which had got into a state of considerable disrepair, has been completely restored. The church is a very old one, but there is little about it of interest to the antiquary. There was at one time an antique memorial here erected by Sir Christopher Heydon in memory of his wife, the Lady Mirabel, but all that now remains of it

there are over sixty parishes, none of them, as may well be supposed, of any great dimensions, but some of an almost inconceivably small size. The parish of St. Mary Mounthaw, for instance, which consists of six houses, and is the smallest parish in the City, may well be ranked as a prime curiosity. This odd parish stands at the corner of Queen Victoria and Friday Streets, and has not possessed a church since the Great Fire of London, when it was burnt down, with many more, never to be rebuilt. What we may well call the "surname" of the parish either derives from some forgotten benefactor whose name was attached to it, just as we find a neighbouring parish called "St. Margaret Moses," and another "St. Benet Fink," or from some geographical peculiarity, which accounts for the names of "All Hallows, Honey Lane," and "St. Mary, Old Fish Street Hill." The need of these rather cumbersome identifications is obvious when it is said that there were six or seven parishes of "St. Mary" in the City, together with other saints equally well represented. St. Mary Mounthaw was originally somewhat larger than now, but was reduced to its present tiny dimensions when the clearances of house property were made for the construction of Queen Victoria Street, some thirty years since.

slopes steeply upwards, and when planted with trees and laid out in lawns and flower-beds, according to the intention of the vicar and churchwardens, will form a pleasant relief to the monotony of soaring warehouses on either hand.

EXCAVATIONS are now going on at Gibraltar previous to the building of new premises at the corner of City Mill Lane in the main street, and only a few yards away from Commercial Square and the Main Guard, quite in the centre of the garrison. During the past few days some most interesting ancient coins, relics, and skeletons have been unearthed at a depth of from one to ten feet. A Roman wall, supposed to be an old entrance to the citadel, has had to be demolished, and coins of evident Phœnician and Roman date have been discovered. One Phœnician bronze coin has a head on one side and a ship on the other still discernible. There are numerous Roman and Moorish coins and pottery. Relics of a later date point to the Spanish possession. There is a neatly worked metal figure of our Saviour with outstretched hands, evidently belonging to some crucifix, also a medal of the Virgin Mary, suggestive of the 16th or 17th century. The most extraordinary

find of the whole is the unearthing of thousands of skeletons, which have been found in a huge layer, as if heaped together in a large ditch or moat. The skulls are in a fair state of preservation, and are of a decidedly Moorish or Arab type. This would suggest the carnage of one of the Hispano-Moorish battles, when Spain finally swept the Moor from Europe. Cart-loads of human bones mixed with the earth of the excavations have been taken away.

ALL readers of Charles Kingsley's masterpiece "Westward Ho!" will remember the meeting of Sir Amyas Leigh and Salvation Yeo at the Ship Inn, Bideford, and what resulted from that incident. This historic hostelry still stands where it did, and little the worse for wear, judging from a picture of it taken so long back as the seventeenth century. The only change is that it bears a different name, being now known to men as the Newfoundland Arms. But the local licensing magistrates, with Vandal-like indifference to historic claims, have in their sapience determined to effect a far more revolutionary change than that. At their last meeting they refused to renew the licence on the absurd ground that an inn which has for centuries supplied popular wants is no longer necessary "for the requirements of the neighbourhood." This supposition, which we believe to be purely arbitrary, makes no account, it will be seen, of national sentiment; as well might Stonehenge be obliterated because the monoliths do not serve any utilitarian purpose.

WHILE electricity has of late years been making great progress as an illuminant in our streets and shops, none the less important have been the advances made in regard to improving the illumination by gas, by means of the incandescent system. In Liverpool the progress has been marked in regard to gas; and that the incandescent system has gained favour with the Corporation committee responsible for the lighting of the city thoroughfares can hardly be wondered at when it is stated that while by means of the flat-flamed type of burners, now so largely in use, only four candle-power can be obtained per cubic foot of gas, under the incandescent system the maximum efficiency is 30 candle-power per foot of gas, although at present 20 candle-power is the standard. Already between 50 and 60 miles of principal streets have been dealt with by the double burners, and it has now been resolved to deal with ten miles, or 45 secondary streets, with a single burner, those thoroughfares running east and west being dealt with very liberally.

CONSTANTINE CHURCH, Plymouth, has been reopened after restoration. The church walls, covered with plaster, the accretion of a couple of centuries, have been stripped, and the stones cleaned and pointed with a sunk pointing under the direction of Mr. Edmund Sedding, architect, Plymouth. The result has proved most satisfactory, and has given to the church, which is one of the largest and finest in the diocese of Truro, an effective appearance, and many architectural beauties and curiosities hitherto hidden have been revealed.

THE Secretary of the Society for the Protection of Ancient Buildings writes to The Times as follows: "Through your courtesy, a letter from this Society, on the subject of Chichester Cathedral, appeared in The Times of November 6th, 1897, and at the same time this Society wrote to the Dean and Chapter and Restoration Committee pointing out what it considered to be the dangers of the proposed scheme for destroying the then existing work and erecting a new north-west tower. This Society has recently inspected the building, and it regrets to state that some of the evils which it foreshadowed have become accomplished facts, and are now exemplified in the building. The west wall of the nave has been cracked from top to bottom, and a visitor approaching the Cathedral by the western porch will see two fresh long cracks over the large doorway, one being apparently about an inch wide, and the other a quarter of an inch

wide, and on entering the building it will be seen that the cracks go through the full thickness of the wall and run right up to the groining.

SOME time ago the City Corporation asked the County Council to contribute towards the cost of widening Lothbury, between Old Jewry and Princes Street, to 60ft. This improvement was estimated to involve an expenditure of £74,125. The Council declined to co-operate in the matter in the absence of a proposal for continuing the 60ft. thoroughfare by widening Gresham Street throughout. An amended scheme has now been laid before the Council by the Corporation. The latter body seeks a contribution towards the cost (estimated at £42,000) of widening Lothbury to 50ft. The Improvements Committee of the Council recommend the Council to contribute one-third of the cost of the proposed improvement.

It appears from the English Illustrated Magazine that the earliest artist who adopted the street-flags as his canvas, and exhibited an *al fresco* Academy with subjects verging from sunset-effects to lurid salmons and sirloins, was a Paddy Keogh, who opened a picture-gallery of this sort in Ratcliff Highway some forty years ago. The new movement spread rapidly with, unfortunately, spurious developments. For instance, movable pictures, sometimes original, sometimes hired, have replaced the painted pavement. The genuine artists naturally regard this move as unprofessional.

ALTHOUGH the scheme suggested by Mr. G. F. Watts for establishing a memorial gallery in the churchyard of St. Botolph's, Aldersgate, has been readily adopted by the vicar and churchwardens of that parish, it appears that the idea cannot be fully developed until some adjoining ground needed for the extension of the churchyard has been acquired. So far, about half this land has been secured, but a sum of £3000 is needed for the purchase of the remainder, and the vicar of St. Botolph's is anxious to receive contributions towards the amount. As the realisation of Mr. Watts's scheme depends indirectly upon the generosity of the public, it is to be hoped that these necessary funds will soon be forthcoming.

MR. CLAUDE HAYES is showing at the Clifford Gallery a number of watercolour drawings of "East Anglia," a series of agreeable and unaffected landscape studies, which display pleasantly enough the merits of his broadly expressive style. He has not confined himself to the district which gives the show its title, for some typical bits of scenery in other parts of the country are included; but in all the drawings he has gathered together the excellent qualities of atmosphere and luminous colour make themselves felt. The whole collection is consistently earnest and thorough, a record of sound observation and skilled craftsmanship.

CARVILLE HALL, Wallsend, an antique building of historic interest, in course of demolition, has been partly destroyed by fire. A while back the structure was purchased by Mr. Geo. Dixon, builder, of Wallsend, his intention being to raze the place and erect on the site buildings of the same class as those occupying places on the west side of the Avenue. Up to Saturday week operations had so far progressed that fully a story had been taken off the top of the roomy, square-built, old-fashioned residence. Then at this stage the fire took the work of demolition in hand. Many interesting evidences were furnished of the old house's endurance, and of the out-of-date way in which it had been put together by workmen long since dead and gone. Particularly was this so as regarded the ceilings. A vast deal of material seemed to have filled the spaces between the ceilings and the upper floors. Mr. Dixon is a considerable loser by the accident, for the material he was getting out of the Hall was exceedingly valuable to him. Many massive beams of oak timber and much sheet lead were destroyed by the blaze. A fine old-time staircase was also damaged.

Important Announcement

- - in regard to - -

"THE BUILDERS' JOURNAL."

"The Builders' Journal and Architectural Record" is admittedly the best and brightest weekly paper published for the Architectural Profession and the Building and Allied Trades.

Upon repeated occasions the bulk of the "Journal" has been increased.

It is now the intention of the Editor to enhance the authority, artistic quality, and literary and technical excellence of the "Journal."

The pages of "The Architectural Review" cannot adequately cope with the number of authoritative and excellent articles offered from time to time, and the Editor of "The Builders' Journal" has now arranged to take a selection from such articles for insertion in the "Journal."

Among those early appearing will be found an interesting article on "Novelty in Art," by R. Shekleton Balfour; a fully illustrated article on the Birmingham School of Art, by the Headmaster, E. Preston Hytch; and another well-illustrated article on "The Influence of the Human Form on Architecture," by A. R. Jemmett. In preparation for the latter article, the Author made a special visit to Paris, where he secured drawings of exceptional interest.

While "The Architectural Review" will continue to deal with Art subjects of enduring character and undoubted influence, "The Builders' Journal" will publish the more controversial and currently critical subjects offered for consideration.

CHURCH RESTORATION.

CONSIDERED BY THE DISCUSSION
SECTION OF THE A.A.

THE first meeting of the session of the Discussion Section of the Architectural Association was held at 56, Great Marlborough Street, on the 14th inst., Mr. H. J. Leaning, Chairman of the Section, in the chair. In opening the business of the session, the Chairman remarked upon the continued increasing success of the Section, and upon the interesting and useful set of papers which were to be read during the session.—Mr. C. E. Mallows then read a paper entitled "Church Restoration." The author thought that the term "restoration" was a misnomer, for no architect, however great and well versed in the styles of old work, could follow the individuality of the original artist. The misnamed practice had caused the destruction of a great number of our old Art treasures of all kinds, and of the historical associations attached to them. It was frequently quite unavoidable, even when the restorer was acting with the best intentions for the preservation of all that was of interest, to avoid sweeping away the old associations. Our old churches are the best text books for the education of the young architect. St. Alban's Abbey was a notorious example of the vandalism of the restorer, although perhaps in this case it was a rebuilding rather than a restoration. Our friends the painters would no doubt prefer that our old churches should be allowed to wear themselves away, but between this and actual rebuilding, there was a middle course which should be adopted. Every means available should be employed to preserve the old work, wherever possible; only repairs which are absolutely necessary should be executed. The roof should be repaired in sections, bay by bay, and carefully pieced together where necessary; an old thick wall, because it may be a few inches out of the perpendicular, should not be condemned, but if it is absolutely necessary, it should be repaired from the back, cutting out the defective portions and making good in slow setting cement, and every care should be taken to avoid disturbing the face work more than is necessary. If it is required to take up the old floor, gravestones, and tiling, for the purpose of putting a concrete bed under them, they should be carefully lifted one by one, and arranged side by side as they were in the floor, until the concrete work is completed. The earth outside, where it may be above the level of the floor, should be cut back to a slope, and a trench formed at the bottom, sunk low enough to prevent damp reaching the walls, and well drained. Wherever new work is required, it should be of the most unobtrusive character. In concluding, the author suggested the formation of a National Committee for the preservation of historical buildings, the members of which should be chosen from amongst the best and most conservative of our artists. The committee should be endowed with powers, absolute and without appeal, to give or withhold sanction for alterations and repairs. On their part, architects should report all instances of restorations they may discover to be in progress to the Society for the Preservation of Ancient Buildings.—Before inviting Mr. Millard to open the discussion, the Chairman expressed the regret of Mr. Joseph Pennell that he was not able to be present at the meeting as announced.—Mr. Millard said he did not think such an objection should be taken to the term "restoration." The men of old did not hesitate to alter an old building when necessary, and these alterations made the history of the building. The anti-restoration craze was a product of

this century. We must allow that the right to alter an old building rested with its owner. And the question is not whether we should alter, but how we should alter. With regard to Mr. Mallows' suggestion for a National Committee, he instanced that in France the restoration work is carried out under a government committee, and the results are execrable.—Mr. Selby proposed a vote of thanks, which was seconded by Mr. Lanchester, to Mr. Mallows for his interesting paper.—Mr. H. V. C. Smith concurred with Mr. Millard in considering the question from a common-sense point of view. Many old churches owed their only claim to beauty on account of the addition made at various times and to accidental circumstances.—Mr. Jemmett thought that the sentimental aspect received more consideration than the utilitarian. He was inclined to try and reproduce the idea of the original designs in its completeness, and would pull down all the later additions.—The discussion was continued by Messrs. W. B. Hopkins, G. Lucas, A. S. Tayler, and H. Rose.—In summing up the discussion, the Chairman said he agreed with Mr. Jemmett to a certain extent, and remarked that in some cases copying must of necessity be resorted to; but a new addition should be treated in a modern spirit.—A vote of thanks was passed with acclamation to Mr. Mallows, and he briefly replied.—The Chairman announced that the next meeting would be held on Nov. 4, when a debate on "Modern Architectural Tendencies as illustrated by Contemporary Work" would be opened by Messrs. Ellgood, Jemmett, and Lanchester.

THE MARTELLO TUNNEL.

AMONG other heavy works engaging the attention of the South Eastern Railway at present is the troublesome task of cutting down the chalk cliffs which tower up for a great height above the Martello tunnel, between Folkestone and Dover. The Martello tunnel—so called from one of those old coast defence towers being situated immediately over it—has always been, if not an anxiety to the Company, at least a cause for constant vigilance, on account of the frequent landslips which have threatened the stability of it. The chalk rests here on a stratum of blue gault, and the landsprings percolating through cause constant slides and fissures. The tunnel has been consequently watched for some years past, and works have been for some time in progress which have for their object, not actually the opening of it into a cutting, but the reduction of the crushing weight above. Only 10ft. thickness of chalk will be retained above the crown of the arch, which will then be relieved of the downward pressure, and will serve the very necessary purpose here of resisting the strong lateral thrust exercised by the seaward lie of the chalk and gault formations. It will then be not so much a tunnel as arched over retaining walls. It should be added that the Martello tunnel is 766yds. long, and that some 300 men are engaged on the works.

MARTELLO TUNNEL.

A SERIOUS INDICTMENT.

THE ALLEGED IDLENESS OF BUILDING TRADE OPERATIVES.

CONTROVERSY still rages around the allegations of idleness in the building trades. This week something is said in defence of the maligned workmen. Mr. H. R. Taylor, L.C.C., of the Operative Bricklayers Society, writes:—"A London architect charges the building trade operatives in general, and the bricklayers and plasterers in particular, with idleness, incompetence, intemperance, and blackballing, but anyone reading between the lines of his effusion will observe that the 'independence' of the workmen is the chief burden of his complaint. With regard to the charge of idleness I feel proud to say that the average workmen have the most supreme contempt for the idler of every class and station, and I would further remind the writer and all those whom it may concern that the proportionate number of idlers among the working classes are infinitesimal as compared with the idlers belonging to the same class as 'A London Architect.' As to incompetence, I am bound to admit there are bricklayers and bricklayers, just as there are architects and architects, a truism your correspondent will readily appreciate. An indifferent bricklayer would, in all probability, make an excellent architect, but an indifferent architect could never become an excellent bricklayer, and indeed the out-of-work tramcar men he refers to would find it much easier to become professional architects than skilled bricklayers. The sober, industrious, and best workmen can only be found on the best jobs, leaving those jobs where the materials are inferior and the work shoddy to be manned by the indifferent and less thrifty workmen, evidently the class of work and the class of workmen 'A London Architect' is most conversant with. Bricklayers, like architects, are not 'paragons of virtue,' and why bricklayers should be condemned for blackballing a man when they are only following the example set them by the medical, legal, architectural, and other professions, I am at a loss to know. Again to charge the increased cost of building to labour only is manifestly unfair, the increase being chiefly due to the rise in prices of building materials, bricks and cement alone having risen in price between 50 per cent. and 60 per cent., a point on which the writer is discreetly silent, presumably because the workers do not get the benefit. But when the writer sighs for 'the good old days of Queen Anne' the murder is out, because in these 'good old days' the wages paid, the hours worked, and the conditions of labour generally were fixed by the employers, and if necessary enforced by law from which the workmen had no appeal. The organisation of labour has changed all that, and to-day the workmen can meet employers and architects on something like equal terms which apparently gives umbrage to 'A London Architect.' Hence these tears. The few careless and indifferent workmen who exist to-day are the results of the conditions of labour which obtained a few years ago, and for which unscrupulous employers, indifferent architects, and a thoughtless and shortsighted public were to blame, and if 'A London Architect' thinks I am wrong I am prepared to meet him and debate the matter in public."

A FOREMAN'S REPLY.

"A Foreman Mason with Forty Years' Experience" also replies to "A London Architect" "This individual," he says, "makes a very serious mistake in writing as he does, and I think it is a shame to bring such an infamous charge against the workmen employed on buildings, as it is far from being correct. He seems to be under the impression that all workmen are drunkards (I, myself, am an abstainer). It is true there are a few who indulge rather too freely, but it is most unfair to class all of them the same, and as regards 'a large proportion' not being at work on Monday mornings, this must be considerably

reduced to a few, whom he seems to base his letter on. But he must remember that no matter where you may go there are black sheep in every flock. It is a gross injustice to say that the men do not do a fair day's work, as it is certainly untrue, and to prove this, how is it that builders amass such a large amount of money in a short time? There are, I am very sorry to say, some people who would like to force men to work all day and night for a mere pittance, and sweat them by not giving them time to do their work properly, which is the cause of a good many of these accidents. I should like to make these individuals change places with the men and see how they would like it. It is not very laborious to visit the different jobs and find fault with the men and try to drive them, but let them change places—I am perfectly sure the men would not be averse to this. I do not know whether this architect is an Englishman or a foreigner, but by the tone of his letter I should say he had more than an ordinary interest in the use of this so-called fibrous plaster. If he is an Englishman I do not think he has much respect for his fellow countrymen, and surely we see now more than enough of inferior workmanship labelled 'Made in Germany.' At the present date we go in for modern sanitary buildings, not old-fashioned 'Queen Anne's' style of encouraging infectious diseases by the re-introduction of wooden mouldings and canvas hangings for walls, which would be more liable to cause fire and destruction than plastering would do. You might as well bring into fashion the old original velocipede and do away with the up-to-date pneumatic bicycle. What is more ridiculous? And as to doing away with the plasterers altogether he would have to deal with all the other building trades. It is simply absurd to write such rubbish. He writes: 'A man of ordinary physique and intelligence' can lay bricks in a fortnight. I ask, Can he? It is not so easy as it looks, and he would find it out if he had a try. A good many architects don't know the difference between 'A' and a bull's foot as regards the different articles used for building."

THE ATTACK RESUMED.

Another correspondent—"A Contractor"—resumes the attack:—"I agree with every word and statement 'A London Architect' makes. Things have now come to such a pass that something must be done to put a stop to this disgraceful state. Only the other day the bricklayers on one of my contracts objected to the general foreman spending so much of his time on the scaffold looking after them. They will next object to the architect and builder going on the works at all. Brickwork, which a few years ago cost £3 to £3 10s. a rod for labour, now costs anything from £7 to £10. It is impossible for a contractor to make a profit under such conditions, and it is equally impossible for the general public to have their buildings executed at anything like a reasonable figure. My firm do work in the country as well as in London, and I can assure you that the same serious state of affairs which exists in town exists in the provinces. 'A London Architect's' suggestion for getting over the plasterer's difficulty is a good one, and I only hope other architects will do as he suggests; but his method of dealing with the bricklayers is, I fear, impracticable. The moment a contractor puts on tramcar men, &c., to do bricklayer's work, the bricklayers, and probably all the other trades, would strike, and the last state of that builder would be worse than the first. What I suggest is that if the bricklayers will not do a fair day's work (and it is a very easy matter to have a standard of work arranged) the master builder shall federate, and simply close their works in London and the provinces until such time as the men will agree to do a fair day's work. I am convinced that if the builders, backed up by the architects, would do this the present scandalous state of things would soon cease to exist."

BUILDING IN THE WESTERN STATES.

"H.P.G.B." writes: "How is it that in America and Canada, especially in the Western parts,

where labour costs most, the builder can get so much better value for money out of his men? I speak from experience, as I worked in Manitoba and British Columbia for several years. There they have their trade unions, as strong or stronger than we have, but somehow the workman takes a pride in being a rapid as well as a good worker. He is ashamed to see the next man on the job getting over more ground than himself. Moreover, foremen over there are not afraid to speak to their men, even to the length of downright bullying. These men are for the most part from the Old Country, enticed abroad by tales of high wages, and forgetful or ignorant of the fact that in Manitoba, on account of frost, and in British Columbia on account of rain, building operations are practically suspended for five months in the year—November, December, January, February, and March. Two-thirds of them, especially the married ones, if they felt sure of a job, would be glad to return to England, and pay their own expenses. I feel perfectly certain that in a week in November I could pick up in Vancouver alone fifty first-grade operatives in any branch of the building trade, who would be only too glad to come home to a guaranteed job, sign an agreement not to join the union, and pay their own expenses. These would be men who had been long enough in the Colonies to have shaken off the traditional crawl of the ordinary British workman; and I would commend a trial to some enterprising firm, who can spare a representative to make the trip, and try what I suggest."

WHAT IS A FAIR DAY'S BRICKLAYING?

Mr. Harry Hems writes to us as follows: "In your article headed 'A Serious Indictment' in this week's issue occurs the following: 'One of your correspondents says he can remember when a man would lay 800 to 1000 bricks per day. On first-class work this was a recognised day's work of ten hours. Three or four years ago I could only get from 400 to 500 laid in the day of nine hours, but now the average number does not exceed 200 on precisely similar work.' In the Society of Arts 'Artizan' reports on the Paris Universal Exhibition of 1878 (page 350), occurs the following, from the pen of Mr. George M. Berry: 'In Paris I understand a bricklayer will execute about 2 metres cube of brick work a day. That would be equal to laying 990 bricks in eleven hours. This number is less by about 300 to 400 in eleven hours on similar work as compared with the day's work of an Englishman.' According to this statement a London bricklayer (if Mr. Berry's report be true) lays about 125 bricks an hour. How can this statement be reconciled with the present imputation that he only lays 200 a day?"

A SUGGESTION.

"Architect" writes to us: "As an architect in practice since 1865 I can thoroughly endorse all you state in your article of the 19th inst., though there are exceptions. Some houses are building in my road by a well-known firm of builders. It is a pleasure to see the men work. They are all paid day work and are total abstainers. My scheme of a remedy for the present state of things is to raise the status of the skilled manual workman. I suggest the formation of a guild of the constructive workers, whose members would be well educated, and pledged to good behaviour, and to do the best work in their several trades, and a fair and honest amount of it, as ruled by a committee of the members. They would dress for work appropriately as they would for athletic sports, and insist upon proper dressing room with appliances for washing, &c., on every job. If such a society can be practically worked, and I believe it can, they would never want for employment, and at good wages. Parents had better put their sons as apprentices to such, than as clerks. They would earn more and with shorter hours. I should abolish the wasteful practice of working before breakfast. Let the men come at eight o'clock, having had their breakfast; their dinner twelve to one, and go home at five p.m. That would be eight hours a day, and quite enough for honest work."

Professional Items.

BALLYSHANNON.—The new church of Cashelard, at Ballyshannon, which has just recently been dedicated, is situated on the site of the old chapel. The contract was placed with Mr. David Funston, Brookboro'. The building was designed by Mr. E. J. Toye, Derry, and is of blue limestone, the roof being covered with Bangor slates.

BIRMINGHAM.—Another arcade is to be built in Birmingham, between New Street and High Street, independently of the one already projected by the City Arcades Company in connection with their scheme for erecting an arcade between Corporation Street and High Street. The plans, prepared by Messrs. Essex, Nicol, and Goodman, provide for the construction of an arcade from New Street to the Louvre, in High Street, and joining at right angles the arcade about to be commenced by the City Arcades Company, between High Street and Corporation Street. Under the new scheme there will be three shops fronting New Street, with entrance to professional and other offices above, and fourteen shops in the arcade, over which are to be ranges of offices and showrooms. Provision has been made for a large café underneath the whole of the front block of buildings, with imposing entrance from the arcade, and a staircase down from one of the New Street shops. The arcade is to be three stories in height, and the passage will be covered with an ornamental glass roof. The interior elevation is to be faced with ornamental glazed faience ware, while the elevation to New Street will be similar in style to the Louvre buildings. The first section of the City Arcades contract is only from High Street to about half way towards Union Passage, but as the Louvre Arcade is expected to be constructed at the same time, there will be a complete arcade joining New Street with High Street in the shape of the letter L. The total cost of the new arcade is roughly estimated at £25,000.

BELFAST.—The new electric supply station at Belfast is at present almost finished. The principal façade, which is toward East Bridge Street, along which it extends for about 225ft., is treated in red brick and Giffnock stone in the style of the English Renaissance. The chimney stack, a novelty in tall chimney construction, is of quite an ornamental character, the red brick being judiciously relieved with courses of artificial stone, while a cornice and mouldings of the same material has been introduced, the whole being surmounted by a cast-iron cap, to which four lightning conductors have been fixed. The height of the structure is 175ft., and diameter at base 25ft. The contractors for the buildings are Messrs. J. and W. Stewart, the architects being Messrs. Graeme-Watt and Tulloch.

BRADFORD.—The new St. Catherine's Home, Bradford, has been formally dedicated. The building is situated in St. Mary's Road, Manningham, adjoining Salem Chapel, and opposite to the Children's Hospital. The building, which has been constructed from designs prepared by Mr. James Ledingham, architect, is built of local stone, and the exterior is in a modified Queen Anne style, without much ornament, but what ornamentation there is is concentrated upon the entrance and several principal features of the building. The most prominent characteristic of the new building, both in its architectural form and internal arrangement, is the absence of many features of uniformity and regulation usually associated with hospital life. The following are the principal contractors:—Masons and joiners, John Moulson and Son; plumbers, Wearden and Co.; slater, Thomas Nelson; heating apparatus, Joseph Thorp; painters, S. Lupton and Sons; electric light, G. A. Steintal; wrought-iron work, Walker and Co.; furnishing, Alfred Speight.

A new Board school has just been opened at Clayton, Bradford. The school is built on the

central hall principle, and consists of two sections, divided by a partition, which can be removed, when the requirements of the school demand it, without destroying the unity of the plan. Accommodation is provided for 600 children—400 in the mixed department and 200 in the infants' department. The plans of the building, which have been prepared by Mr. Abraham Sharp, of Bradford, were accepted in open competition. The work has been performed by the following contractors:—Mason, Ephraim Balmforth, Queensbury; joiner, Ineson Taylor, Keighley; plumber, A. Walton, Clayton; slaters, J. Smithies and Sons, Bradford; plasterer, S. Sunderland; heating apparatus, Hargreaves and Dewhurst, Bradford; painter, W. Sharp; ironfounders, Taylor and Parsons, Bradford.

The new school which has been erected at Sandy Lane by the Bradford School Board is built facing the main street of the village of Sandy Lane, and the area of the site is 5539 square yards. The cost of the school is:—Site, £830 17s.; buildings, £3176 12s. 3d.; furniture, &c., £128 13s.; other expenses, £443 17s. 9d.; total, £4580. This amount includes asphaltting and other work yet to be done. The school has been erected from plans prepared by Mr. E. P. Peterson, and the following were the contractors:—Masons, Messrs. C. Booth and Son; joiner, Mr. C. Helliwell; plumbers, Messrs. T. and K. Pratt; plasterers, Messrs. J. Black and Son; slaters, Messrs. Nelson and Son; painter, Mr. S. Cockroft; ironwork, Mr. W. Longbottom; heating apparatus, Mr. T. Mears.

CHESTERFIELD.—A Diamond Jubilee Drill Hall has been erected at Chesterfield on a site presented by the Corporation in Ashgate Road. The hall is constructed from competitive designs prepared by Mr. W. Cecil Jackson, Chesterfield. It has a frontage of 165ft. on Ashgate Road, and the total cost is put at £2500. The building is comparatively plain in style. The elevations are of brick, with stone dressings, and relieved with strong buttresses with ornamental stone terminals. The main entrance is in the centre of the front, facing Ashgate Road. This takes the form of a vestibule, 12ft. square, and elaborately ornamented in stone. On the front face are carved the arms of the Derbyshire Regiment and the Borough Arms, surmounted by a lion's head. On a scroll are the words "Diamond Jubilee Drill Hall," and oak and laurel leaf work is tastefully interwrought. A turret and a flagstaff surmount the roof. The greater portion of the interior is devoted to drill purposes, forming a room 156ft. long by 55ft. in width. At the eastern end of the hall a portion has been partitioned off and apportioned to the headquarters' staff, comprising officers', sergeants', quartermaster's, adjutant's, and clerks' rooms, and armoury. In the basement is a room which can, if necessary, be converted into a rifle range. The roof is iron girdered—a clear span of 50ft. At the western end of the hall is a very neatly designed band gallery, approached by a double stairway. Mr. John Wright, of Chesterfield, is the contractor.

COMPTON (Devonshire).—At Compton village a new Baptist chapel and school has just been opened. The new building has been erected by Mr. Samuel Blatchford, contractor, Torquay, from drawings prepared by the architects, Messrs. Bridgman and Bridgman, of Torquay and Paignton. The contract sum was £360. The walls have been built with local limestone, dressed for the front, and are relieved with red brick. Bath stone has been used in the front façade for strings, lintels, arches, window tablets, and parapet copings, &c.

DORCHESTER.—The steady improvement of South Street, the main artery of the town, has been carried a step further by the erection of a new shop. The plans were prepared by Mr. A. L. T. Tilley, architect, Dorchester, and the work has been carried out by Mr. J. Selby, builder, of Broadmayne. The shop front is

made the chief feature, and is constructed of glazed faience ware, whilst the inner walls are lined with glazed tiling in similar style. This faience ware and tiling is real Dorset, having been manufactured at Messrs. Carter and Co.'s potteries at Poole.

GATESHEAD.—The new parish house erected in connection with St. Bede's Church, Sunderland Road, Gateshead, was opened a week ago. The new building is of stone, the roof is solidly framed, and cleaded, then covered with felt and slated. The inside part is worked in a pretty and effective style.

HOLMFIRTH.—A new working men's club has been built at Scholes, near Holmfirth. Mr. G. H. Birch, F.S.A., of London, prepared the plans, which are being carried out by the following contractors:—Masons, Messrs. Marsden and Sons, Holmfirth; joiner, Mr. Jonas Battye, Scholes; plumber and glazier, Mr. Joah Tolson, Holmfirth; painter, Mr. Eli Quarmby, Holmfirth; plasterer, Mr. Haigh, Holmfirth; and hot water heating apparatus, Messrs. Thornton, Huddersfield. The building will be a substantial stone structure.

HULL.—New baths were opened recently in the eastern division of Hull. The building is a brick structure, and adjoins the Reckitt Library, in Holderness Road. The front elevation is an artistic treatment of red brick and terra-cotta, which harmonises with the architecture of the adjoining library. The plans of the building were prepared by the City Engineer (Mr. A. White) and the Assistant Engineer (Mr. Bricknell), and under their supervision the work has been carried out. The premises have cost about £15,000.

KENDAL.—The new Zion Chapel at Kendal, which has been in course of erection about two years, has recently been dedicated. The general shape of the building is oblong; it is 106ft. by 54ft., and accommodation is provided for 700 people. The building comprises spacious vestibules, lofty nave, north and south aisles, and a chancel 20ft. in depth, with semi-circular apse, and contains organ and pulpit. The exterior is faced with cut freestone in the Gothic style. The contractors, who have done their work in a first-class manner, were:—Masonry and slating, Mr. Wm. Thomas; carpenter and joiner's work, Mr. Wm. Hutchinson; plasterer's work, Mr. Benjamin Davis; plumbing and gasfitting, Mr. Jacob R. Tanner; and painting and glazing, Mr. Jas. Hine. The total cost, exclusive of site, is about £4500. The building is from the designs and supervision of Mr. Stephen Shaw, architect, Kendal.

LANCASTER.—Sir Thomas Storey, of Lancaster, has just presented to the trustees of the Royal Albert Asylum for Idiots from the North of England a handsome building, which is to be used particularly as a home for feeble-minded girls. The architect was Mr. E. Howard Dawson, who unfortunately has not lived to see the completion of the work.

LEEDS.—The contracts for the extension of works for Messrs. Harding, Richardson, Rhodes, and Co. Limited, have been let to the following firms:—Excavator, bricklayer, and mason, Wade Bros.; terra-cotta work, A. Whitehead; carpenter and joiner, Wm. Nicholson and Son; slater, J. Season; plumber, E. Tattersall; ironfounder, Bagshaw and Son, Batley; painter, T. Heptonstall. The total amount of the contract is £15,462. The work will be proceeded with immediately from the plans and under the supervision of Mr. William Bakewell, F.R.I.B.A., Leeds.

WOODBIDGE.—The fine parish church of St. Mary, at Woodbridge, in which a "Jubilee" window was placed some few weeks ago, has been further adorned by the insertion in the north wall of the north side of a memorial in similar form of the late Mr. Thomas Carthew. The new window was executed by Mr. A. L. Moore, of Southampton Row, London.

Enquiry Department.

"STUDENT."—Will you please forward your address? A letter addressed to you lies in this office.—Ed. B.J.

THE SOCIETY OF ARCHITECTS' EXAMINATION.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Where can I get particulars of questions set at the examination held by the Society of Architects a fortnight ago?—Yours truly,
M. P. L. R.
Swindon, Wilts.

Write to the Secretary of the Society, St. James's Hall, Piccadilly, W.

GIRDERS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Will you kindly oblige by explaining the best method to find the weight upon the girder marked 1, 2, 3, and 4 upon the accompanying sketch, and also the sizes of girders required? Thanking you in anticipation.—Yours faithfully,
"NISBET,"
Newport.

Each girder, of course, carries the entire weight of the wall resting on it, but, in addition to this, girders 2 and 4, as the joists run across the building, carry easily ascertained proportions of the loads on the floors and roof, a fair allowance being $1\frac{1}{4}$ cwt. per foot super for floors, and 60 lb. per foot super for roof, to include weight of structure and ordinary live loads. These are all borne as evenly distributed loads. Then half the load borne by girder 4 is conveyed to girder 3 at the point of

A. E. H. is not entitled to do anything which will interfere with the right of his neighbour to cause the sewage from his premises to flow under A. E. H.'s house. I do not think that if he leaves the existing drain as it is, and constructs a new one for the drainage of his own house exclusively, his neighbour will have any cause of complaint, or be able to insist on connecting his own drain to it. But if A. E. H. replaces the existing drain by a new one, his neighbour will be entitled to the benefit of it. All this is irrespective of the question whether the so-called "drain" is or is not a "sewer," and therefore to be replaced by and at the cost of the Vestry, and also of the question whether his neighbour is or is not bound to contribute to the expense.

FLOOR CONSTRUCTION.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I have to construct a yard floor covering some cellaring. The floor must support a movable weight of three tons (a loaded dray and two or three horses). Would you be so kind as to give me some idea as to the thickness of concrete at the crown and the springing, and also the rise? Would it be safe if it were less than 10 in., as I want the floor to take up as little room as possible? I should feel much obliged if you would give me the name and price of some up-to-date and practical book on this sort of construction and ironwork generally.—Yours faithfully,
"COMPASSES."

Sheffield.

A 10 ft. 6 in. square slab of concrete is much too large to trust with such a load unless steel joists be bedded in it at not more than 2 ft.

junction, and a certain amount of this, according to the law of inverse proportions, again conveyed to the point of junction with girder 2, as is also half the distributed load on girder 3. For more detailed information we would refer our correspondent to "Stresses and Thrusts," by G. A. T. Middleton, published by B. T. Batsford.

HOUSE DRAINAGE.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I should be much obliged if you can give me legal advice on the following matter. I have the under-lease of a dwelling-house, and the Vestry has ordered me to reconstruct the drains. The house next to mine belongs to the leaseholder of the two houses, and the drains for both houses run under my house. Am I compelled to have the drainage of the next house passed into my new drain, or can I have a separate drain for my house, and have the other house pipes disconnected?—I am, Sir, yours truly,
A. E. H.

Our legal adviser's opinion is as follows:—

centres, and in any case the arched form of soffit should be avoided, and the concrete be not less than 8 in. thick—this for spans of 2 ft. only—when subject to severe moving loads. It would be better even then to embed in it some form of expanded metal lathing, while a better floor still for the purpose would be one formed of steel decking, such as is supplied by Messrs. Lindsay. Needless to say the ironwork should be carefully calculated. See Middleton's "Stresses and Thrusts," Adams' "Strains in Ironwork," or the fourth volume of "Building Construction" (Longmans).

THE Bishop of Rochester has opened new schools connected with St. Andrew's Church, Leeds.

THE Brighton Town Council have adopted a scheme for clearing a condemned area in the eastern part of the borough. Over 700 persons will be displaced, but accommodation for 400 will be provided on the site when a better class of houses have been erected. Making allowance for the value of the land, this improvement will cost nearly £25,000.

Under Discussion.

A LECTURE ON ENGLISH ARCHITECTURE.

In the Lecture Theatre of the Durham College of Science, Newcastle, Mr. Arnold Mitchell, F.R.I.B.A., recently lectured upon "English Architecture." Mr. Mitchell devoted his remarks to the first period in English Architecture—the Norman period. Referring to the cathedrals, he said the impression one got on visiting one of these great Norman structures was the extraordinary massiveness and strength of the work, and its severe simplicity. This early characteristic was due to the ignorance of the builders—not necessarily ignorance that was wrong, but want of knowledge of how to use the materials employed in their buildings to the best advantage. The designs of these buildings were not a sudden inspiration, but were the gradual outcome and growth of what had gone before; and the builders, in the first great period of Architecture had everything to learn. By means of lantern illustrations, the lecturer explained how this progress was developed through the Norman period, from the severe simplicity of the earlier structures, with the elementary cutting of stonework by the axe, to the more elaborate ornamentation of the later structures, developing with the greater skill in the use of the chisel. The great piers, he said, in the older Norman cathedrals, were not so strong as they looked. The dressed stone that was visible on the outside was merely a veneer or casing, and the core was filled with the roughest of rubble. It sometimes happened that, under pressure of the immense weight, the rubble core was squeezed down, and the casing burst. This occurred, some years ago, with the central tower of Peterborough Cathedral, which had to be taken down and rebuilt. The lecturer explained, too, that the earliest Norman buildings were fortresses, and that, when they turned their attention to churches, the builders carried into them the same idea of strength and simplicity; and he illustrated this by pointing out the similarity between the arrow slits in the castles and the narrow windows of the churches. Proceeding, Mr. Mitchell showed how, with the better knowledge of how to use their materials and tools, the builders made their structures lighter and more carefully ornamented, illustrating this, particularly, in the elaboration of the triforium and tympanum.

WROUGHT IRON WORK.

The Edinburgh Architectural Society opened its winter session on Wednesday, the 19th inst. in the workshop of Messrs. Henston and Stewart, smiths, to hear a paper by Mr. Percy E. Nobbs, M.A., on "Wrought Iron Work." The President, Mr. W. N. Cumming, A.R.I.B.A., was in the chair. After dealing with the history of wrought iron in this country, the most characteristic Continental types were described—the stamped work of the Ile de France of the 12th century, the German Renaissance interlaced work, Spanish Grilles and the Baroque and Rococo of the great French period. In comparing these manifestations with their contemporary work at home, the finding was that much greater skill had been attained on the Continent, but that English work was the more worthy of study, as its designers had invariably been ruled by the material, and had not been led away into the exuberances which make so much foreign work—rather a wonder of ingenuity than of beauty.—Mr. A. Lorne Campbell, the critic, touched upon the rapid improvement in wrought iron work during the last few years, and recommended the study of the best modern work.—The paper was illustrated by a quantity of drawings and photographs, and practical points were discussed in an examination of the work in the shop, and Mr. Stewart exhibited the process by doing a bit of floral work before the audience.

KEYSTONES.

THE mummy rooms at the British Museum have been completed, and are now open to the public.

ADDEAN PARK, near Chiswick, comprising a capital mansion and some 600 acres of good land, has been sold by Messrs. Osborn and Mercer, of Albermarle Street, W., to Mr. Tennent, Haddingtonshire. The price paid was over £20,000.

FARRINGTON ROAD is about to be closed for relaying. The Holborn Board of Works has accepted tenders for relaying the roadway with asphalt, and the footways with Victoria stone, and it is intended to put the work in hand shortly.

THE Dean and Chapter of Norwich have instructed Messrs. Norman and Beard Limited to build a new organ for Norwich Cathedral, at a cost of £3000. The new instrument will stand on the screen, and is expected to be completed next June.

THE Bishop of London has recently consecrated the new Church of Emmanuel, West End Green, Hampstead. It is built of red bricks, having a seating accommodation for 1000 persons. The cost has been £10,200, towards which over £9000 has already been raised.

THE Vaudeville Theatre has long suffered under structural defects of a very serious kind. Improvements have been from time to time effected, but the place still fails to satisfy the exacting requirements of the County Council. Recently, to meet the views of the Council, an extensive scheme of improvements has been formulated; but the Theatres Committee are still not satisfied, and they have decided to inform the Lord Chamberlain to that effect. Short of an entire rebuilding of the theatre, it is difficult to see how it is to pass the official scrutiny.

COLONEL C. H. LUARD, R.E., held an inquiry in the Town Hall, Scarborough, on behalf of the Local Government Board, with respect to an application by the Corporation for power to borrow £33,575 for the purchase of the St. Nicholas House estate. The Corporation are acquiring the property with a view of using the mansion-house for public offices, and converting the gardens into pleasure grounds for the use of the public.—With reference to the St. Nicholas House estate, Mr. H. W. Smith (borough engineer) produced the plans of a suggested scheme for dealing with the existing mansion-house. The outer walls of the building, he explained, would be preserved. Inside there would be a rearrangement of rooms. A council chamber would be provided, as well as rooms for the use of councillors, and in addition accommodation would be provided for various municipal offices, which at present were scattered about the borough.—In reply to the Inspector, the Town Clerk stated that the existing Town Hall in Castle Road would probably be disposed of; but that was not yet settled. Then St. Nicholas House would become the Town Hall. The Corporation wished to secure the gardens for the use of the

public, in which case they would be saved from the hands of the speculative builder.—The Mayor (Mr. James Pirie) tendered evidence as to the value of the property. He said it was in the market, and in private hands it might have been used to the detriment of the town. That was the reason why the Corporation were so anxious to secure it. He valued St. Nicholas House and grounds at £14,075, the Exhibition building (at present let on lease at £500 a year), at £9000; a house and shop in St. Nicholas Street, £2500; and surplus land, £8000.—Mr. S. N. Smith, Chairman of the Finance Committee, stated that in his opinion the property could have been sold for more money. One consideration which prompted the purchase was the fact that the Corporation were continually spending large sums of money on the present Town Hall, which was entirely inadequate for the needs of the borough.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ASHFORD.—Accepted for the erection of iron bungalow, for Mr. E. Kemp, The Woodlands:—
T. J. Hawkins and Co., Ashford ... £105 5

BARNSELY.—Accepted for the erection of five cottages, &c., Spring-street. Messrs. Wade and Turner, architects, 10, Pitt-street, Barnsley:—
Building.—James Bycraft, Park-grove, Barnsley ... £494 0

Plumbing.—William Dransfield, Barnsley ... 18 18
Plastering.—Thos. Marshall, Barnsley ... 44 10
Slating.—Miss M. Fleming, Barnsley ... 53 5
Painting.—Clarke Bridge, Barnsley ... 12 6

BOLIVIA.—Accepted for the erection of iron Customs house, Bolivia (South America), for Messrs. Avelino, Aramayo, and Co.:—
T. J. Hawkins and Co., Ashford, Middlesex ... £312

BRISTOL.—Accepted for the erection of a laundry, South-street, Bedminster, for the School Board. Mr. W. V. Gough, architect, 24, Bridge-street, Bristol:—
Bale and Westlake, Clifton ... £470

BURTON-ON-TRENT.—Accepted for the execution of street works, Eldon-street, &c., for the Corporation. Mr. G. T. Lynam, Borough Engineer, Town Hall, Burton-on-Trent:—
Eldon-street.
G. F. Tomlinson, Derby ... £191 18 7

Nelson-street.
Holloway and Son, Wolverhampton ... 424 13 11

CHESHAM (Bucks).—Accepted for the erection of new shops, additions, stores, bakehouse, and slaughter-house, &c., in the Broadway, Chesham, for the Chesham Co-operative Society Limited. Mr. Geo. H. Green, architect, 340, High-road, Kilburn, N.W., and High-street, Chesham, J. Mead, Chesham ... £2,560
[The lowest of six tenders.]

CLACTON-ON-SEA.—For sewerage, kerbing, &c., West Clacton Estate. Mr. T. H. Baker, architect, Colchester and Clacton-on-Sea. Quantities by architect:—
Contract 4.—Freeland-road.
Moran and Son £2,145 0 0 Mackenzie & Son, ... £1,500 10 0
Everett and Son ... [Architect's estimate, £1,400.]

Contract 5.—Trafalgar and Nelson Roads.
Moran and Son £2,142 0 0 Mackenzie & Son, ... £1,482 12 0
Everett and Son ... [Architect's estimate, £1,435.]

Contract 6.—St. Vincent and Collingwood Road.
Moran and Son £1,592 1 10 Mackenzie & Son, ... £1,087 15 0
Everett and Son ... [Architect's estimate, £1,040.]

* Accepted.

CRADLEY HEATH (Staffs.).—For the supply of 500 tons Rowley granite, for the Quarry Bank Urban District Council:—
Per ton. Per ton.
Richards and Blewitt ... 8 0 Rowley Granite Co., ...
E. Richards ... 7 9 Rowley Regis, Staffs.* 7 6

* Accepted.

EALING.—Accepted for the erection of villa residence at Castle Hill, Ealing, for Mr. Herbert Born. Mr. Edward H. Dance, architect, Quadrant-road, Thornton Heath:—
Strudwick and Pyrie, Ealing ... £1,295

ELGIN.—Accepted for the erection of two houses, Rothes. Mr. R. B. Pratt, architect, County Bank House, Elgin:—

Masonry.—McKenzie & Co., Lossemouth ...
Corpenry.—J. and A. Robb, Rothes ...
Plumbing.—Ross Bros., Duftawn ... £1,133 10
Slating.—Ogilvie, Elgin ...
Plastering.—Melver, Elgin ...
Painting.—Garven and Ward ...

FARNHAM ROYAL.—Accepted for extending the heating apparatus to warm three bedrooms and staircase. East Burnham-grove, Farnham Royal, Bucks. Mr. W. Colling, architect:—
T. Potterton ... £119

FOREST ROW (Sussex).—Accepted for fixing two ranges fitted with patent zig-zag boilers, and heating conservatory, drawing-room, hall, and landing from kitchen and scullery fires. Forest-view, Forest-row, Hartfield, Sussex. Messrs. Merrin and Wagstaffe, architects:—
T. Potterton ... £143

HARROGATE.—Accepted for levelling, &c., Northumberland-court, for the Corporation. Mr. S. Stead, Borough Surveyor, Harrogate:—
J. Frost, Harrogate ... £278 15 9

HENLEY-ON-THAMES.—For the erection of a town hall, for the Corporation. Mr. Henry T. Hare, architect, 13, Hart-street, Bloomsbury-square, W.C. Quantities by Mr. R. B. Hogg, 10, John-street, Adelphi, W.C.:—
Lorden and Son ... £12,777 Bottrill and Son ... £10,843

C. Gray Hill ... 12,583 Walden and Cox ... 10,692
G. H. Gibson ... 12,307 Kinglerie and Son ... 10,449
Cox and Son ... 12,000 W. Hawkins ... 9,900

C. H. Hunt ... 11,565 McCarthy E. Fitt, Reading (accepted) ... 9,766
H. Flint ... 11,263 Hughes ... 9,696

General Builders, Ltd. 11,150

HOLMWOOD.—Accepted for the erection of ornamental wooden lodge for Mrs. Eva McLaren at Minnickfold:—
T. J. Hawkins and Co., Ashford ... £350

LEWES.—For the erection of temporary iron asylum buildings for the accommodation of 100 patients, for the Visiting Committee of the East Sussex Asylum. Mr. Henry Card, County Surveyor:—
T. J. Hawkins and Co., Ashford ... £4,654 10

LITTLEHAMPTON.—For the execution of street works Gloucester-road, &c., for the Urban District Council. Mr. H. Howard, surveyor, Town Offices, Littlehampton:—
Gloucester-road.
Grounds and Newt in, Hounemuth ... £167

Purbeck-place.
Snwin Brothers, Littlehampton ... 131

LONDON.—Accepted for fixing patent zig-zag boiler, 105, Tilse Hill, Brixton, and warming dining-room, hall and staircase, study, drawing room, two bedrooms, and bathroom from kitchen fire, in conjunction with hot-water domestic supply, for Mr. W. Williams:—
T. Potterton ... £115

LONDON.—For the construction of the northern and south end outfall sewers, for the West Ham Corporation:—
R. Ballard ... £29,709 0 0 C. W. Killingback, ... £19,991 2 8

W. Neave & Son 23,834 0 0 and Co.* ... 19,975 11 5
B. Cooke and Co. 23,241 0 0 Pedrette and Co. ... 18,869 0 0
R. Jackson ... 22,638 0 0 G. Bell ... 19,715 0 0
T. Adams ... 22,431 19 8 Clift Ford ... 19,715 0 0
J. Jackson ... 20,330 0 0 * Accepted.

Engineer's estimate, £16,500.

MARLOW.—For the erection of stabling, for Messrs. Thomas Wethered and Sons, The Brewery, Marlow, Bucks. Mr. James H. Deacon, architect, High-street, Marlow:—
J. S. Carter ... £1,230 0 W. Lumpon ... £1,107 0
H. Harris ... 1,108 15

* Accepted provisionally.

NAIRN (N.B.).—For the erection of granite boundary walls at the cemetery, for the Parish Council. Mr. J. R. Douglas, C.E., Nairn:—
Excavation and Masonry Work.
John E. Gibb ... (granite) £1,091 18 10
Robert Squair ... (freestone) 841 0 0
Taylor and Smith ... (granite) 790 0 0
D. Mathieson and Co. ... (freestone) 705 3 3
Thomas McDonald ... (freestone) 584 9 0

CONTRACTS OPEN.

CALEDONIAN RAILWAY COMPANY.
EDINBURGH STATION HOTEL.
CONTRACT FOR MASON WORK AND IRON AND
STEEL WORKS.

The Directors of the Caledonian Railway Company invite TENDERS for the ERECTION of a STONE and STEEL WORK of the new Hotel to be erected at Prince's-street Station, Edinburgh.

The drawings and conditions of contract may be seen at the Office of Messrs. PEDDIE and WASHINGTON BROWNE, Architects, 6, Albany-place, Edinburgh, on and after MONDAY, the 17th inst.

Copies of the specification, schedule of quantities, and form of Tender may be obtained from the Architects on payment of a deposit of Two Guineas per copy for the Mason Work, and One Guinea per copy for the Iron and Steel Work.

Sealed Tenders, addressed to the undersigned, and marked "Tender for Edinburgh Station Hotel," must be lodged with him on or before MONDAY, NOVEMBER 7th, 1898.

The Directors do not bind themselves to accept the lowest or any of the Tenders.

J. BLACKBURN,
Secretary.

Caledonian Railway Company's Offices,
Glasgow,
October 11th, 1898.

3

ADMINISTRATIVE COUNTY OF CARMARTHEN.
TO CONTRACTORS.

The County Council of Carmarthenshire are prepared to receive TENDERS for the ERECTION of a STONE BRIDGE of Three Arches and Approaches thereto over the River Towy at Dryslwyn, in accordance with the drawings and specification prepared by Mr. THOMAS CODRINGTON, M.Inst.C.E.

The drawings may be inspected between the hours of NINE a.m. and FIVE p.m. at the Office of the County Surveyor, The Shire Hall, Carmarthen, where a copy of the specification and form of Tender may be obtained upon depositing a cheque of £5, which will be returned on the receipt of a bona-fide Tender.

Sealed Tenders (on the form of Tender attached to the specification) must be addressed to me, endorsed "Tenders for Dryslwyn Bridge," and be delivered at

my Office at Llandovery on or before NOVEMBER 18th next.

The County Council do not bind themselves to accept the lowest or any Tender.

THOMAS JONES,

Clerk to the County Council,
Llandovery, October 6th, 1898.

THE BOARD of WORKS for the
LEWISHAM DISTRICT.
KERBING, TAR-PAVING, METALLING, AND
CHANNELLING WORK.

The Board is prepared to receive TENDERS for KERBING and TAR-PAVING the FOOTPATHS and CHANNELLING and METALLING the ROADWAY of Gabriel-street (part of), Forest Hill.

The plan and specification of the work and form of contract may be seen at these Offices (Surveyor's Department), where printed forms of Tender and other particulars may be obtained.

The Tenders must be on the forms issued by the Board, enclosed in an envelope, sealed, and endorsed "Tender for Gabriel-street," and must be delivered on or before FOUR o'clock on TUESDAY, NOVEMBER 1st, at the Offices of the Board, and placed in the box there provided for the purpose.

The Board does not bind itself to accept the lowest or any Tender.

By order,

EDWD. WRIGHT,
Clerk to the Board.
Lewisham Town Hall,
Catford, S.E.
October 20th, 1898.

HAMPTON WICK URBAN DISTRICT
COUNCIL.

The above Council invite TENDERS for the Supply and Delivery on land adjoining their Wharf by the River Thames of

550yds. (in Two Lots) of GUERNSEY GRANITE or QUENAST STONE, broken to pass a 2in. ring. Sealed Tenders, endorsed "Tender for Road Material," to be sent to the Chairman on or before NOVEMBER 5th next.

The Council do not bind themselves to accept the lowest or any Tender.

J. NIXON HORSFIELD, F.S.I.,
District Surveyor.

Hampton Wick,
October 11th, 1898.

TO BUILDERS AND CONTRACTORS.

The London County Council is prepared to receive TENDERS for the ERECTION and COMPLETION of NEW PUBLIC CONVENIENCES at Blackwall Tunnel (North Side).

Persons desiring to submit Tenders may inspect the drawings and obtain the specifications, bills of quantities, form of Tender, and other particulars at the Architect's Department, General Branch, No. 13, Spring Gardens, S.W., upon payment of the sum of Ten Shillings.

This amount will, after the Council or its Committee has come to a decision upon the Tenders received, but not before, be returned to the tenderer, provided he shall have sent in a bona-fide Tender and not have withdrawn the same.

Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with.

The contractors will be bound by the contract to pay to all workmen (except a reasonable number of legally-bound apprentices) employed by them wages at rates not less, and to observe hours of labour not greater, than the rates and hours set out in the Council's list, and such rates of wages and hours of labour will be inserted in and form part of the contract by way of schedule.

Tenders are to be delivered at the County Hall in sealed covers addressed to the Clerk of the London County Council, and marked "Tender for Conveniences at Blackwall Tunnel."

No Tender will be received after TEN o'clock a.m. on TUESDAY, NOVEMBER 15th, 1898. Any Tender which does not comply with the printed instructions for Tender may be rejected.

The Council does not bind itself to accept the lowest or any Tender, and it will not accept the Tender of any person or firm who shall on any previous occasion have withdrawn a Tender after the same has been opened, unless the reasons for the withdrawal were satisfactory to the Council.

INTRODUCTION OF NON-FLAMMABLE WOOD INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to
Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"Iowa" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.
"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known

colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING,
(each of which is over eighteen stories high).

"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company
by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,
2, Army and Navy Mansions, Victoria Street, London, S.W.

Protective Metallic Coatings for Iron and Steel.*

BY SHERARD COWPER-COLES,
Assoc. M. Inst. C.E., M.I.Mech.E., M.Inst.E.E.

TO preserve iron and steel from oxidation it is necessary to exclude air and moisture, which is effectively done by a coating of zinc, cadmium, or copper, under certain conditions. Before dealing with the different processes for applying these metals, it will be as well to examine the chief causes that tend to corrode iron and steel. Amongst the most noteworthy changes of late years in the materials employed for constructional and engineering purposes is the very extensive substitution of steel for wrought iron. Ironmasters are dispensing with the puddler's services, and are using steel instead of puddled bars for rolling down into sheets, hoops, strips and other products, while engineers are now employing steel in many situations where formerly only iron was to be found. It is interesting to note, as demonstrating the almost exclusive employment of steel in shipbuilding, that during last year 98·5 per cent. of the tonnage claimed by Lloyd's Register was built of that material, and only about 1·2 per cent. of iron. The age of iron is giving place to

AN AGE OF STEEL.

With its many advantages over iron, steel unfortunately possesses one serious drawback: it corrodes more rapidly. At the present time it is a matter of very serious consideration with Lloyd's underwriters and with shipowners as to the advisability of encouraging more iron in the present type of cargo vessels so as to ensure a longer life to the ships. Mallet found the comparative liability of iron and steel to oxidation in moist air to be: cast iron, 100; wrought iron, 129; steel, 133·† The following table, compiled by Mr. B. H. Thwaites, is of considerable interest.

C = Coefficient of corrosion during one year's exposure in lbs. avoirdupois per square foot. (For value of C, see Table.)

W = Weight in lbs. of one foot length of the section exposed.

L = Length in feet of the perimeter exposed. If both the inside and outside perimeters are exposed to the corrosive action, they must both be included.

‡Y = The number of years' life of the metal
= $\frac{W}{C \cdot L}$.

Sir George Findlay, in his book "The Working and Management of an English Railway," states that the corrosion of steel rails as compared with iron rails is in the proportion of about five to four, and that in tunnels and manufacturing districts where sulphurous and other acid gases are present in the atmosphere, the life of a steel rail is shortened to a material extent. Mr. J. Farquharson has shown that while steel plates when tested alone lost about 12oz. by corrosion, iron plates similarly tested lost about 11oz. M. Gruner published the result of a year's researches into the comparative oxidisability of cast iron, steel, and soft iron under the influences of moist air, sea water, and acidulated water. He found that in twenty days steel plates lost three to four grammes every square decimeter of surface. Chrome steel rusted more, tungstated steel less, than carburized steel. Cast iron only lost about half as much as steel, and spiegel-eisen less than grey iron.

RECENT ANALYSES

have been made of twelve samples of boiler plates or tubes, all of which samples had

failed by corrosion when in use, the pitting being generally quite local. The percentage of carbon in these ranged from 0·3 to 0·31 (average 0·08), that of silicon from 0 to 0·89 (average 0·01), of phosphorus from 0·3 to 0·309 (average 0·102), of sulphur from 0·01 to 0·10 (average 0·04), of copper from 0 to 0·27 (average 0·12), of nickel from 0 to 0·13 (average 0·05), and of manganese from 0·05 to

dency of the iron to rust is increased. Mr. F. Carulla has observed that raw tar has a very marked effect on wrought iron. One case which came under his notice was some bolts which had been very badly pitted, the bolts were fixed in some valve boxes used for pumping water from a well where the water had been contaminated with tar residues. The water, on analysis, was found to be basic, and

0·82 (average 0·33) per cent. Of all these specimens, which exhibited but slight power of resistance to chemical attack, there was but one that was poor in manganese and phosphorus; and of two new tubes from the same works, one contained 0·51 per cent. of manganese, and was strongly corroded in spots by sulphuric acid, whilst the other contained only 0·09 per cent. of manganese and resisted attack. Hence, it would seem that these two elements are responsible, directly or indirectly, for the want of resistance to oxygen and water at comparatively elevated temperatures.

Sea water dissolves iron rapidly, and acts upon it more powerfully than upon steel. In the rusting of iron there is formed, together with an evolution of hydrogen (which combines with nitrogen, forming a small quantity of ammonia), ferrous carbonate. The presence in rust of ferrous oxide, carbonic acid, and ammonia is thus explicable. Rust formed under water, in consequence of the small amount of acid present, is usually richer in protoxide of iron, and, therefore, little magnetic, and of a deeper tint than that formed in air. It is accordingly assumed that the carbonic acid present in the atmosphere and in water acts in the production of rust similarly to those acids in which iron dissolves, the only difference being that in the rusting of iron the ferrous salt first formed changes before it is dissolved into basic salt or ferric hydrate; the change is a natural result of a solution of iron in an insufficient quantity of the acid or water present, or both. Where rusting has already begun, a change from the first-formed ferrous compound to ferric hydrate is attended by the setting free of the acid, which is then in a condition to act powerfully in the

FORMATION OF FRESH RUST.

Rust already formed should be quickly removed, in order that a fresh layer should not be produced; rust being promoted by acids existing in the air. Iron is destroyed more quickly in marshes and bogs than in lakes or considerable currents of water which are generally free from acids. Forged iron appears to rust on the bands of impurity occurring in it. A coating of fat protects iron for some time, but when the fat absorbs oxygen from the air it becomes rancid and in part changed into fatty acids, and the ten-

it was found to have a strong smell of naphthalene or gas liquor. The water yielded on analysis:—

Total solids at 110°	82
Free ammonia	0·43
Albuminoid ammonia	0·01
Chlorides, expressed as chlorine ...	12·20
Carbonates, expressed as CaCO ₃ ...	22·00

From the part that galvanic action takes in the corrosion of iron it follows that those substances positive to iron which in mere contact with it prevent it from rusting, promote the same if they are alloyed with the iron, for such are in general more positive than iron itself. Thus manganese alloyed with iron promotes the tendency of the latter to rust. So long, however, as the quantity is uniform and not too large, its effect in this direction is inconsiderable. In connection with the presence of acid gases in the atmosphere, Dr. Angus Smith, many years ago, found that 100 cubic feet of black smoke contained 33 grains of sulphuric acid, and, further, that in London the acidity of rain, calculated as sulphuric acid, was rather more than 2 grains in 10 gallons, and the rain of Glasgow more than 10 grains. Thin steel plates are largely used for constructing the hulls of such vessels as torpedo boats, but thin steel oxidises even more rapidly than thick steel, in consequence of the scales of rust being thrown off as soon as formed by the expansion and contraction from alterations of temperature. This danger of corrosion appears to deter engineers from using steel pipes to the extent they might. To such an extent is

THE EVIL OF THE CORRODIBILITY

of steel felt, that some engineers still object to its use, or specify that a large portion of the work, such as the upper deck floors, should be of wrought iron. The tubes for water tubes are found to corrode very rapidly, and are, therefore, now generally galvanised. M. Olsoy has analysed the powder found in the pits of boilers, and found it to contain 86·26 per cent. of peroxide of iron, 6·29 per cent. of grease and other organic matter, and 4·25 per cent. of lime salts. In the face of these facts the question of an effective protective covering for steel becomes of supreme importance. What then is the most effective protective coating for iron and steel? At present the answer is, decidedly, zinc; but in the near future aluminium coatings may supersede those of zinc,

* A Paper read before the Society of Engineers, on October 3rd, 1898.

† Brit. Assoc. Rep. 1342-42.

‡ Y is based on the assumption that the metal is tolerably uniform in thickness, otherwise the thin portions will have a shorter life than the average of the section.

In experiments of iron in acid, it was found that the metals, according to their impurities, lost most in the same time—steel less than iron, soft steel less than hard steel. On the second day the soft steel lost more than hard; on the fourth day the less was equal.

although experiments in this direction have not yet met with success. Galvanised sheets made of steel with the oxide formed in rolling removed, and then coated with spelter, would no doubt be more generally used in boiler or tank work if the advantages were better understood. The extreme

CHEAPNESS OF STEEL PLATES

and improvement in manipulation has been followed by the substitution of steel plate stacks and chimneys for brick. It is, however, well for boiler makers to remember that the action of moisture, especially when impregnated with sulphur arising from soft coal, has a destructive influence on steel plates, rusting them rapidly, particularly in the lighter gauges. This may be somewhat delayed by frequent painting or varnishing. A coating of spelter on steel sheets is impervious to moisture, and therefore the life of the metal is preserved indefinitely, especially when the galvanised surface is painted with the ordinary commercial stack or boiler paints. Sea air, charged as it is with brine, is more destructive in its action upon galvanised ironwork than the air on land, as it forms a chloride which is readily soluble. Mr. Chas. Young, in a paper read before the Society of Arts, mentions that a zinc sheathing attached in plates to an iron plate which had been submerged in the sea off Portsmouth, was found to have dissolved to the extent of one ounce per square foot in twelve months, and that zinc

TO RETAIN A CLEAN SURFACE,

must exfoliate or waste at about the same rate as copper, namely, two ounces per square foot per annum. Zinc is much affected by all acids, organic and inorganic; hence zinc does not afford much protection to iron when in contact with oak. Soot or carbon forms a galvanic couple with zinc in the presence of acid and water. The action of water, containing lime salts, on zinc is very much the same as that of moist air, the metal becoming coated with a protective covering of mixed oxide and carbonate. Zinc which is chemically pure does not decompose water, or, at any rate, only very slightly; this, however, is not the case with the zinc of commerce, which is violently attacked by very slightly acidulated water. Hot galvanising is often condemned as reducing the tensile strength of iron and steel, when the fault really lies with the smith who sends the work to be galvanised when he has made a bad weld, instead of leaving it in the black for inspection. Too much reliance is often placed on galvanising for making joints watertight. But still zinc forms

THE MOST EFFECTIVE COATING FOR IRON at present in practical use, and is capable of withstanding the corroding influences which boiler tubes are subjected to.

(To be continued.)

At University College, Professor Osbert Chadwick, C.E., delivered an inaugural address in opening the course of municipal engineering and Chadwick lectures and demonstrations of municipal hygiene instituted by the trustees of the late Sir E. Chadwick. Relatively, said Professor Chadwick, little practical instruction could be obtained from lectures alone, however complete, and their utility was vastly increased by a course of practical work. The drawing office was an essential adjunct to academic instruction, and it was above all things necessary that the student should be an expert draughtsman, capable of drawing plans with accuracy, neatness, and expedition. Engineering, he maintained, was a high art, the art of applying the great sources of power in nature to the use and convenience of man—an art only to be acquired by experience, practice, and personal observation. In a well-equipped mechanical laboratory the student may be taught to produce the parts or whole of a machine, but obviously the construction of bridges, roads, and the like could not be attempted. The student, however, could be prepared with the essential scientific knowledge, and taught how to learn the profession of a civil engineer.

Trade and Craft.

BRIGGS' BITUMINOUS ENAMELS.

The largest and finest vessel in the world, R.M.S. "Oceanic," surpassing in dimensions even the "Great Eastern," is being coated with Briggs' bituminous enamels. Three other White Star liners are being done with the same material. Briggs' enamels are manufactured with large and carefully devised steam plant, and applied in the most efficient and economical manner possible. Orders for acres of work from many of the largest shipping firms in existence show the results of fair competition.

MESSRS. COLLEDGE AND BRIDGEN.

We have before us a leaflet illustrating a variety of sanitary enamelled wrought steel sinks manufactured by Messrs. Colledge and Bridgen, of Wolverhampton. One of these illustrations we reproduce; it represents the "Eclipse" sink with rolled rim, brackets, and brass strainer couplings. The firm manufac-

tures a variant on this pattern of sink, similar in every detail, but with the advantage of a splashier back. Another variety is "The Special." Whatever the pattern, however, there are advantages of workmanship common to all, inasmuch as each is light, seamless, and, within reasonable limits, indestructible.

MESSRS. WEBB AND CO.

Messrs. Webb and Co. have executed innumerable contracts for decorating walls and floors of hotels and restaurants, but this class of work is only one branch of a many-sided business, the extension of which, by-the-by, has necessitated a removal from Euston Road to more compact and convenient premises at No. 68 and 70, Lant Street, Borough, S.E., where the firm's warehouses and showrooms are now situated. Messrs. Webb's mosaic pavements and picture panels are now very commonly met with in churches and public buildings of all kinds, and several important contracts now in hand will enable the firm to further extend this decorative work. The showrooms at Lant Street are well stocked, and afford a happy hunting ground for the architect in search of various decorative accessories. Here we have seen tiles of tasteful design for dados, and amongst other things some fine marble and Ceramic and Venetian mosaics.

MESSRS. ADAMS AND CO.

A brochure on "Some of Adams and Co.'s best things" at this year's Sanitary Exhibition at Birmingham, gives special prominence to their "Titanite" ware. "Titanite" is the registered name of a new glazed ware of exceptional finish and strength—the firm say it has the finish of porcelain and the strength of fireclay. Besides, it does not craze and is impervious to moisture. It is used for closets, lavatories, urinals, and hospital appliances, and in cost only slightly exceeds that of the ordinary glazed ware. In this brochure there are illustrated lavatory basins which anyone might be proud to see fitted into his house. Their construction is based on the soundness of sanitary principles. They are up to date

with the latest fittings, and withal combine a taste and elegance of construction of which, years ago, so unimportant a thing as a lavatory basin would have been considered unworthy. The cheapest pattern here shown is the "Oval;" the most expensive is the "Surgeon's," which for neatness and elegance of appearance we have rarely seen equalled. Of the types of closets, Adams' patent seat-action combination closet must attain the highest standard of excellence yet known. There are other patterns worthy of note; for school work the Multiple closet has many advantages.

EMPLOYERS' LIABILITY.

IN the Westminster County Court a few days ago, Judge Lumley Smith, Q.C., and a jury had before them the case of Broom v. The Army and Navy Stores, which was a claim under the Employers' Liability Act for £280 damages for personal injuries by Henry Broom, a builder's labourer, of 1, Christchurch Villas,

Union Road, Clapham, from the Army and Navy Stores, Limited, Westminster, which he alleged he sustained through the negligence of a foreman whose orders he was bound to conform to.—Plaintiff's case was that one thing he had to do which was beyond his ordinary duties was to go round a gallery outside the fourth floor on that portion abutting on a well in the centre of the building. The gallery was of iron, and iron grids were lodged in the framework of the gallery. On one side of the frame was a ledge, and at each end a small piece of metal to lodge the grid on. Plaintiff had to go the round night and morning to open and close iron shutters to the windows. The shutters were an enactment of the London County Council as a fire-spreading preventative. On February 10th plaintiff was going round when a grid tipped up and

LET HIM THROUGH THE FRAME.

He fell 34ft. 6in. on to a skylight, and sustained serious and permanent injuries to his left arm. It was contended that the foreman was negligent in ordering plaintiff to walk on the gratings, which were not properly retained. The grating in question was defective, it having "a half-inch play" in the frame. Eighteen of the grids had been wedged up since this accident.—For the defence it was contended that under the Act, if there was any defect, it did not arise through the negligence of the defendants, but existed when they took over the building from the contractors. The architect was in no sense in the employ of the Stores, who were not bound to examine the building to see that all was correct.—Counsel for the plaintiff asked the jury to find the defendants' superintendent and foreman were negligent in not discovering the defect.—The jury found for the plaintiff for £140.

MESSRS. SHANKS AND Co., sanitary engineers, Barrhead, have secured the contract for the construction of a large underground convenience in the Market Place, South Shields. The work will be of the best quality throughout.

VENTILATION.

By W. N. TWELVETREES, M.I.M.E., M.S.I.

(Continued from page lxxxv.)

III.

APPARATUS used for lighting, other than electric lamps, add to the problems already furnished. Not only is air vitiated, but a considerable amount of heat is produced, the latter effect being sometimes pleasantly, and at others unpleasantly, obvious. A cubic foot

FIG. 11.

of coal gas is capable of generating 696 heat units, and of consuming the oxygen in about 15 cubic feet of air. As some oxygen escapes combination, it is proper to allow 30 cubic feet to a cubic foot of gas consumed. An ordinary gas burner consumes 0.083 cubic foot of gas per minute, requiring 1 cubic foot of air and generating fifty-eight heat units. If one gas-burner be allowed per head, a cubic foot of air must be included with other calculated quantities. The heat generated must not be overlooked, especially during warm weather, and it is easy to determine its effect, and to ascertain the volume of air required to limit increase of temperature to 20 deg. For this purpose the rule already given would be thus stated:—

$$V = 58 \div (20 \times .238 \times .0761) = 16 \text{ cubic feet.}$$

Petroleum lamps use about two-thirds the bulk of air required for an ordinary gas-burner, and heating power is in the ratio of 0.93 to 1.00 as compared with gas.

In order to ensure a perfectly healthful and wholesome atmosphere, it is essential that sufficient air should be introduced into every building for the purpose of diluting and removing exhalations from the skin, etc. The volume thus necessitated per head varies from 4 cubic feet per minute in private dwellings, and 66 cubic feet per minute in fever hospitals. Special circumstances attending each case must be considered, and provision be made accordingly.

Having now inquired into the relative effects produced by the various internal causes of vitiation in air, it will be convenient to summarise some of the results so obtained.

The total volume of air required for ventilation is not to be arrived at by simply adding up the amounts stated under various headings, because some of the different functions mentioned may be performed by one and the same quantity of air. Air respired is already charged with heat, carbonic acid, and vapour, but air introduced for the absorption of animal

heat is capable of also taking up vapour from the skin and that resulting from lighting appliances. Speaking generally, all air which has received heat has an increased capacity for moisture, conversely, air which has absorbed moisture has an increased capacity for heat; and, again, vitiated air is equally partial to either moisture or heat. Thus, separately considered, the minimum quantities of air required for the different functions of ventilation are as stated in Table VIII., and Fig. 11 is a diagram showing the minimum and maximum volumes, which have been generally advocated up to the present time.

TABLE VIII.

	Duty.	Cub. Ft. per Min.
1	Air for Respiration ...	31
2	" " Perspiration ...	3.5
3	" " Heat ...	4.0
4	" " Light ...	1.0
5	" " Exhalation ...	4.0
	Total ...	12.81.

In practice it is found that the volume necessary for either heat or exhalations is perfectly capable of performing the other duties stated as well as its own. This is shown in Fig. 12, where the air for exhalations is amply sufficient in volume to discharge all other functions. In some instances it may be found that the removal of personal warmth, of heat from gas-lights, or for dilution of exhalations, must preponderate, but the increased volume so provided is always found to represent the maximum quantity.

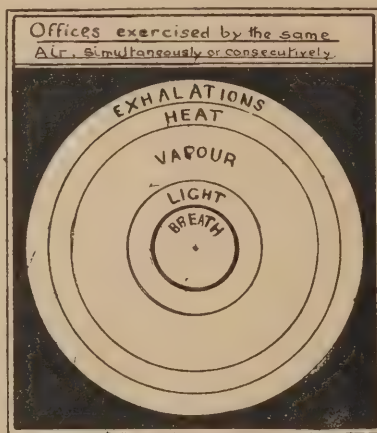

FIG. 12.

Considerable divergence of opinion exists as to the number of cubic feet of fresh air which should be provided for each person, the tendency, however, especially during recent years, has fortunately been towards increased supplies. Table IX. has been compiled from data given by well-known authorities, as well as from those obtained in a number of public and other establishments. Similar statistics, in cubic feet per minute, are graphically depicted in Fig. 13. These figures, as will be demonstrated later, may with advantage be considerably increased.

TABLE IX.

Description of Buildings.	Cubic feet per head per hour.
Dwelling houses ...	500
" " sick rooms	1000
Schools and colleges:	
" " Children	400 — 500
" " Adults	1000 — 1500
Theatres ...	1500 — 1750
Assembly Rooms ...	1000 — 2000
Workshops: Ordinary ...	2000
" Insalubrious ...	3500
Barracks, workhouses, prisons	1000 — 1500
Hospitals: Ordinary ...	2000 — 2500
" Fever ...	4000 — 5000

It should always be borne in mind that the quantity of air required is influenced by local and geographical situation. Considerably more air is necessary in large cities than in the open country, and the internal causes of vitiation, which have already been discussed, also exercise a marked bearing on the question generally.

The structural arrangements of buildings are not without their effect upon ventilation; wind, according to its direction, may assist or interfere with ventilation by penetrating through the walls, and it is always desirable that rooms should be of ample size. When this is the case the air is not so speedily vitiated, although it will soon become unfit for respiration if adequate ventilation be not ensured. In hospitals the number of cubic feet per bed ought not to be less than 1200, and in fever hospitals it is usual to allow at least 2000 cubic feet of space for each patient.

SIR MICHAEL HICKS BEACH has laid the foundation stone of the new church at Nailsworth, near Stroud.

THE Wallasey District Council has under consideration a new scheme for the water supply of the District, which is estimated to cost about £465,000. Mr. C. F. Deacon, C.E., has been instructed by the Council to prepare plans and to make surveys and trial borings at a cost of £700. The sub-committee selected to deal with the scheme propose to impound the waters of a tributary of the Clwyd in Flintshire, Nannerch being the place where a miniature Lake Vyrnwy will be constructed for that purpose. The gathering grounds will include nearly 3500 acres, and it is estimated that the supply will yield 2,600,000 per day. The water is said to be equal in quality to that at Vyrnwy. The distance from the reservoir to new Brighton is about eighteen miles, and the mains will probably be carried from Nannerch, which is situated at the back of Moel Famman, to a point opposite Thurston, where they will cross the Dee and come through the peninsula of Wirral. As the supply will meet the demands of a population of 104,000, and that of Wallasey is now calculated at 46,000, the district council would be in a position to supply Birkenhead with one-half the quantity obtained. At no distant period the corporation in that borough will most likely be compelled to supplement the supply of its own wells from some outside source. It is quite possible that Hoylake, West Kirby, and other districts in Wirral might be induced to participate in the new water supply.

FIG. 13.

FAST RESERVOIRS.

IT is useful just now to note the progress of the Staines reservoir works. The prospect of all London suffering from a water famine owing to the Thames running short, just as East London has suffered owing to the failure of the Lea, has (says London) brought the whole question of the water supply of London prominently to the fore again. In the meantime extensive works are going on at Staines, which have an important bearing on this subject. Nearly 2000 men are hard at work making two vast reservoirs, which will store water for the people of London to the extent of 3300 million gallons. Three of the chief water companies north of the Thames, the Grand Junction, the North Middlesex, and the New River, have combined to provide additional storage in the Thames Valley. Mr. Walter Hunter, M.Inst.C.E., a director of the Grand Junction, in conjunction with the late Mr. W. Fraser, M.Inst.C.E., formulated a scheme some five or six years ago for an enlarged system of reservoirs. He claimed that the capacity of the Thames for the water supply of London was misunderstood and greatly undervalued. He pointed out that the average quantity taken from the Thames was about 90 million gallons daily, while the average flow was about 1350 millions and the maximum flow about 20,000 million gallons daily. His idea was that a large additional quantity could be drawn from the river if

A PROPER SYSTEM OF RESERVOIRS were constructed. Originally a scheme was prepared for nine reservoirs, each with a capacity of 2000 million gallons, capable of ensuring an average daily supply of 300 million gallons. Two years ago Messrs. Hunter and Middleton were instructed to prepare plans, which were adopted by Parliament. These plans presented a good many modifications of the original scheme, as the three companies were anxious to carry out the recommendations of the Royal Commission as to increased storage. A joint committee was formed to superintend the works, consisting of three members from each of the companies. The committee got powers to raise £1,000,000 in debenture stock for the purpose of the necessary land and for the construction of the works. Under the Act the joint committee are not allowed to take more than 100 million gallons from the Thames in any one day. Only the surplus water above the flow in the river of 265 million gallons at Bell Weir is to be drawn upon. The intake is at Bell Weir, so that by the time the river reaches Teddington Weir the engineers claim that the flow would be at the rate of 364 million gallons. But between Sunbury and Molesey the water companies have a right to draw 130 million gallons, reducing the flow at Teddington Weir to 234 million gallons. The reservoirs are not expected to be complete for four years yet. The works were commenced last April, and so far progress has been rapid and without any drawbacks. The intake is situated on the Middlesex side of the river a little above Bell Weir, where

SEVERAL SLUICES ARE BEING CONSTRUCTED, and it is protected by screens to prevent leaves and other floating matter from entering the conduit. The first part of the conduit is closed; afterwards it flows towards the reservoirs open like a natural river. The conduit

is syphoned under the Great Western and the South Western railways, under the Wyrardisbury river, and also under the Colne. The pumping station is situated near the Billet Bridge, which carries the London Road over the River Ash. At the pumping station there will be five triple-expansion engines, each capable of delivering 16,000,000 gallons daily into the reservoirs. The water will be delivered into reservoirs through steel pipes, which are believed to be the largest yet constructed. Proper sluices will be provided for regulating the supply into and from the reservoirs. The reservoirs, which are two in number, known as No. 1 and No. 1A, are about a mile and a quarter in length and a mile across at the southern end, and over half-a-mile at the northern end. The embankments are being built at a height varying from 21ft. to 35ft. They are being built of material excavated from the interior of the reservoirs, the excavation just balancing the banks to prevent the necessity and expense of running material to spoil. The slopes of the embankments are three to one inside, and two to one outside the reservoirs. In the centre of each bank a puddle wall is being constructed 6ft. thick at the top, 7ft. at the ground level, and tapering down to 5ft., where it joins the London clay, into which it will be securely toothed. This construction, for which this part of the Thames Valley is favourably adapted, will make the reservoirs perfectly tight. The inside slopes of the reservoirs are to be lined with concrete 5in. thick for a depth of 15ft., so as to resist any wave action which may take place in so large a sheet of water.

Surveying and Sanitary Notes.

THE ceremony of cutting the first sod, preliminary to the construction of a new reservoir to supplement the Harrogate water supply, took place a few days ago. The site of the new reservoir is at Scargill, where the Corporation—who recently acquired the Waterworks Company's entire undertaking for £206,000—have purchased a gathering ground of 1100 acres from Sir H. D. Ingilby, of Ripley Castle. The reservoir will have a surface area amounting to thirty-two acres, with a maximum capacity of 220,000,000 gallons. It is anticipated that the work of construction will be completed in about three years, the estimated cost being £100,000. The work is being carried out by the Corporation, under the superintendence of Mr. W. E. Dixon, waterworks engineer.

FOR some time past a series of very important and interesting experiments have been made in East Kent, with the object of ascertaining the water producing powers of the great chalk areas. The investigations, which have been conducted scientifically, have produced some very valuable results, particularly in regard to the enormous quantity of the purest spring water which runs to waste daily by being poured into the sea from the base of the chalk cliffs. From observations made, it is estimated that at least one hundred million gallons of water is lost in this way daily in the St. Augustine's Division of East Kent alone. The experiments have been made at intervals over

a period of two or three years, and it is a very remarkable fact that, notwithstanding the great drought which is affecting the upper springs all over the country, the tests made during the last few days at the base of the cliffs between Dover and St. Margaret's show that there is absolutely no diminution in the supply of spring water, which is escaping into the sea. From observations made, there is no doubt that these outflows of water from the chalk strata occur all along the seaboard from Dover to the Medway. It is well-known, too, that in the marshes between Canterbury and Dover there are other great outflows of spring water at the surface.

SIR DOUGLAS GALTÓN, as chairman of the Council of the Sanitary Institute, recently delivered an address at the Parkes Museum, Margaret Street, as an introduction to a course of lectures and demonstrations in sanitary science, in the course of which he referred to the multifarious duties cast upon the sanitary inspector, and pointed out the need of special training for the discharge of these functions. He thought, however, that the most astonishing fact connected with recent legislation was that whilst the sanitary inspector, who was intended to be the right-hand of the medical officer of health, was required to possess considerable knowledge and technical skill, he was nowhere protected either as to his emolument or as to the tenure of his office. He urged that sanitation should be made a branch of elementary education; meanwhile the sanitary inspector was the missionary upon whom devolved the duty of urging the people to pay attention to sanitary details. In reference to the requirement of the Public Health Act (London), 1891, that sanitary inspectors should possess a certificate of competency from some authority approved by the Local Government Board, Sir Douglas announced that some delay had occurred in forming the joint board for this purpose, to be composed of delegates representing the Sanitary Institute and other bodies, and that consequently next year's examinations would be conducted by the Sanitary Institute, as before.

THE Lancet sees a new terror to the Londoner in the multiplication of underground electric railways, unless certain precautions be taken. It contains complaints that on the Waterloo and City line nothing has been done to secure the adequate ventilation of the tunnel in the event of an emergency. "It must not be forgotten," it says, "that visible smoke and plainly discerned smells serve after all in the ordinary underground railways as an excellent index of the state of the air, but in the absence of these things, as on the underground electric railways, there is no such guide, and insidious poisoning by repeatedly inspiring human exhalations is possible, if not, indeed, suffocation." The other day there was a breakdown on the line, and the delay was sufficiently long to cause a marked sense of suffocation to the passengers. "It is assumed, and correctly, that the advance of a train through a tube which it closely fits is sufficient to maintain an adequate change of air in the tunnels, in which case no extra provision for ventilation need be made, but in the event of a breakdown the supply of air would soon be exhausted, and the result might be disastrous and comparable with the awful historic tragedy of the Black Hole in Calcutta."

Property and Land Sales.

Sales for the Year 1898.—Telephone No. 669 Bank.—Telegraphic address, "Akaber, London."

MESSRS. BAKER & SONS beg to announce that their SALES of LANDED ESTATES, Investments, Town, Suburban, and Country Houses, Business Premises, Building Lands, Ground-rents, Reversions, Shares, and other Properties will be held at the Mart, Tokenhouse-yard, E.C., on the following Fridays during the year 1898:—

October 28 | November 11 | November 25 | December 9
Auctions can be held on days besides those above specified.—11, Queen Victoria-street, E.C.

By order of the Bridge-house Estates Committee of the Corporation of the City of London.—A highly valuable Building Site, covering an area of considerably over an acre in the heart of the City.

MESSRS. BAKER and SONS are instructed by the Bridge-house Estates Committee to LET by AUCTION, on Building Lease, for a term of 80 years, at the Mart, Tokenhouse-yard, on FRIDAY, OCTOBER 28th, at TWO o'clock, to be offered in one lot, and if not so disposed of in four lots, the important BUILDING SITE, comprising Nos. 5, 6, and part of No. 7, West-street, Nos. 36 to 48 (inclusive), Finsbury-circus, Nos. 2 and 4, Circus-place, Nos. 101 to 116, London-wall, and Albion Hall, with warehouses, &c., adjoining, occupying a total area of 49,000ft., and possessing frontages of about 750ft., offering magnificent sites for the erection of bank, insurance, and other offices, shops, professional or business premises, well worth the attention of builders, capitalists, and others, affording an opportunity seldom obtainable of acquiring prominent building sites in the City.

Particulars, plans, and conditions of sale of the City COMPTROLLER and CITY SURVEYOR, Guildhall, E.C.; and of the AUCTIONEERS, 11, Queen Victoria-street, E.C.

Strawberry-hill, Middlesex. Within eight minutes' walk of the Station on the L. and S.W. Railway.

MESSRS. TOPLIS and HARDING will SELL by AUCTION, at the MART, E.C., on FRIDAY, NOVEMBER 11th, at TWO o'clock punctually:—

The valuable FREEHOLD PROPERTY known as Nos. 5 and 6, Waldegrave-terrace, Strawberry-hill, Middlesex, producing rentals, actual and estimated, amounting to £60 per annum, together with a plot of FREEHOLD BUILDING LAND adjoining, ripe for development, and having a frontage to Waldegrave-terrace of about 55ft., a depth of about 154ft., and an area of about one-third of an acre.

Particulars, plans, and conditions of sale may be had at the Mart, E.C.; of F. G. MEADOWS, Esq., Solicitor, 9, Fenchurch-buildings, E.C.; and of Messrs. TOPLIS and HARDING, 66, Cannon-street, E.C.

Sale of Valuable Freehold Land.—Harlington, Middlesex.

SEDGWICK, SON, and WEALL will SELL by AUCTION, at the Mart, Tokenhouse-yard, London, E.C., on MONDAY, OCTOBER 31st, 1898, at TWO o'clock precisely:—

23 acres of valuable BUILDING LAND, with good frontages, close to Hayes Station on the Great Western Railway, ripe for immediate development. An enclosure of Arable Land, believed to contain brick earth of great depth, close to Harlington Church, containing about seven acres; also

A Piece of Building or Accommodation Land, containing 1a. 2r. 0p., situate in New-road, and suitable for the erection of a block of cottages.

Particulars and conditions of sale may be had at the Mart, E.C.; of Messrs. BEDFORD, MONIER-WILLIAMS, and ROBINSON, Solicitors, 6 and 7, Great Tower-street, London, E.C.; of Messrs. SEDGWICK, TURNER, and JODIE, Solicitors, Watford, Herts.; of Mr. E. P. NEWMAN, Land Agent, Hillingdon, Uxbridge; of Mr. R. NEWMAN, Auctioneer, Harlington, Hounslow; and of the AUCTIONEERS, Watford, Herts.

Puvis de Chavannes.

A MEMOIR.

THE great romantic school of modern painting will soon be but a memory. Yesterday Burne-Jones went from us, to-day Puvis de Chavannes has joined the great innumerable multitude. Wholly absorbed into that world from which the inspiration of their works proceeded, and in which themselves mainly lived, those makers of history have in their turn become historical.

They have gone back to their own sphere and left us strangely solitary.

There is something very fitting in the nearness of these two departures. None can have studied their works without seeing that

decoration of large public buildings, were unhappily denied Burne-Jones. The indifference, ignorance, or incuriousness of public bodies and architects shut the latter artist out from the noblest of all forms of decoration, and while Puvis de Chavannes was covering walls of museums, municipal buildings, lecture halls, and churches with his marvellous compositions, the genius, the colour instincts, the decorative faculties with which Burne-Jones was so richly endowed, were given no like opportunities of development.

It is not suggested that the French are in any way more liberal towards artists than ourselves. After years of study, after repeated rejections at the Salon, Puvis de Chavannes received at the age of 37 his first commission. The State, that is to say, a committee of artists, purchased in 1861 a large decorative composition. It was destined for the staircase of the museum at Amiens. Overjoyed, the painter presented the corresponding panel to the municipal authorities, and Amiens is now rich in fine samples of his work. But it is rich largely because of the painter's own generosity. According to M. Arsene Alexandre, only one private commission, the "Doux Pays," painted for M. Bonnat, was ever received by M. de Chavannes. And France is full of *patrons* of Art.

young and struggling artist and fawn on him when older and successful, were just as rife in France as here. All through his life Puvis de Chavannes was a butt for the feeble-witted critic, a mark for the mockery of the Philistine and the lower public. But he treated it all with a fine indifference; and the series of masterpieces grew unchecked by any critical onslaught. The painter knew his strength, and, comforted by the admiring friendship of men like Delécluze, Paul de Saint Victor, Theophile Gautier, and Theodore de Banville, he retired within himself, lived out his dreams, and achieved his own salvation. Amiens, Rouen, Portiers, Lyons, Marseilles, the Sorbonne, The Pantheon, are to-day places of pilgrimage to all lovers of noble artistry.

Puvis de Chavannes was born at Lyons on December 14th, 1824. He was a descendant of an old Burgundian family, and was himself a typical specimen of that marvellous race which has for more than 600 years enriched France with so many celebrated painters, sculptors, and artists of all kinds.

He was educated at Lyons and, strangely enough, while at college resolved to take up a scientific career. But at the critical moment he made a journey into Italy; and thenceforth he determined to be an artist.

ASHBY ST. LEDGERS: THE BIRTHPLACE OF THE GUNPOWDER PLOT.

though separated by race and place and circumstance, both men lived in the same world, remote, mystical, serene. Both men breathed the same spiritual atmosphere. Though their methods were different they were twins in mental attitude towards nature and human affairs. Both showed the same concentrative-ness, the same ingathering of spirit from common things and thoughts, the same reverent outlook, the same avid appetite towards beauty. Each, as was fitting, admired the other as the complement of himself. The largeness of style, the spaciousness, the architectural dignity of design acquired by Puvis de Chavannes through long years spent in the

From the very beginning of his career he was, as Burne-Jones himself, assailed by the abuse of the vulgar and the ridicule of the stupid. The great mass of the public, as ever, too lazy to think, too careless to see, was roused by the attacks of the orthodox critics to unreasoning hatred of what it failed to understand. That same despicable blindness to real beauty which makes our leading comic papers shower ignorant abuse on all that is noble when it is new, the same pitiful toadyism which makes them beslaver with vulgar praise whatever survives their attacks, that same spirit which made them scoff at Burne-Jones when a

After studying for a while under Henry Scheffer, the brother of Ary Scheffer, he then made a second journey into Italy with one of his friends, Bauderon de Verneron. And it seems at least probable that the magnificent frescoes of Piero della Francesca, of Fra Angelico, of Luca Signorelli, and Ghirlandajo, inspired in him that passion for wall decoration which afterwards made him famous.

On his return he entered the *atelier* of Delacroix. The latter, weary of teaching, discouraged by lack of appreciation, closed his studio and dismissed his pupils three weeks afterwards. Puvis de Chavannes then

went to Couture for instruction, and after three months left him suddenly, disgusted with the artificiality of his methods and his teaching. From that moment the great painter became his own master. He took, in 1852, that famous studio in Place Pigalle, which he only left two years ago.

From that quiet little place proceeded, without rest, without haste, those embodied visions of peace and tranquil beauty we now passionately worship. Undisturbed by any storms without, in the inexpugnable calm of his soul he worked and waited. More than anything else a sentiment of peace disengages itself from the work and enwraps the spectator in its eternally beneficent effluence—that effluence which proceeds from every noble nature. So much is this felt in his own country that M. de Vogüe, in a most eloquent and noble article on the great painter, says:—"He has taken with him, wrapped in his shroud, like the reflux of the wave behind a departing ship, all that remained to us of peace. . . . For the first time the ritual invocation in the office for the dead, 'Requiescat in Pace,' seemed to me unnecessary. That blessing we implored for him he had enjoyed these many years—the prayer was for ourselves and not for the soul departed." He needs no monument who has thus moulded the minds and souls of his fellowmen.

As recorded above, the first great decorative scheme was that prepared for Amiens, and here, so far back as 1861, the painter showed that amazing power of resuming in a single scene the poetry of a whole county, and of expressing that poetry in a single pregnant phrase—the mere titles, *Picardia Nutrix* (1865); *Bois Sacré* (1883); *Inter Artes et Naturam* (1890-92); *Ludus pro Patriâ* (1879); to name only a few, are full of suggestion and inspiration.

This scheme was followed by others for Marseilles, Lyons, Rouen, Portiers, the Sorbonne, and the Town Hall, and the Pantheon in Paris, and the Boston Library. They cannot be described, they must be seen; and to see them there is an education of the highest kind. They come to one as a spiritual revelation—they strike upon the mind of the beholder with a kind of shock, as of some long desired but un hoped for vision of beauty—a vision presented without flourish, without apparent effort, silently, irresistibly incuriously, as by Nature herself. Indeed, it is Nature who speaks to us in him—Nature concentrated, ennobled, purified, in the alembic of a mighty soul. The man who did all this was as simple in his life as in his works. He was always cheerful, always ready to sing, to drink, to start excursions with his friends. He did not reject what life has to offer; he accepted and enjoyed it with a tranquil mind. He saw and knew how to express with the greatest sanity and clearness the glorious beauty of it all, and we are as much the poorer by his death as we are the richer by his life—a life spent in the service of his country and his Art. H. W.

MR. J. WOOLLEN writes from 33, Albert Square, Clapham Road, S.W.:—"Apart altogether from the fact that Vauxhall Temporary Bridge is an instance of as wanton a waste of public money as it was possible for even officials to devise, actual experience during the time it has been open to public traffic has clearly demonstrated that it is a source of danger to the public and of intense cruelty to the poor horses that toil up or down its steep inclines. It is totally unfit for vehicular traffic, and public safety demands that such should be prohibited. . . . With wintry weather, narrow slippery roads, and steep declines, only miracles can possibly save heavy vehicles like omnibuses from violent collision with other traffic that may be passing, or stone or concrete wall on one side of the river, or brick wall similarly situated on the other side."

ASHBY ST. LEDGERS:

THE BIRTHPLACE OF THE GUN-POWDER PLOT.

By WILLIAM YOUNG, P.A.S.I.

THE anniversary of "Guy Fawkes Day" is upon us. It was at Ashby St. Ledgers that the diabolical Gunpowder Plot was hatched, and where the authors are said to have met to discuss this historic conspiracy.

The place is situated out of the ordinary route of the tourist, seven miles from Rugby; the nearest railway station is Welton, which is about two miles distant. It immediately adjoins the village of the same name, and is a very quiet and secluded spot.

The historical room shown in the sketch on our front page is part of an ancient building over an old gateway, consisting in all of two rooms—one evidently a secret closet without a window, and the other the scene of the memorable meetings—approached by a handsome massive oak staircase, with the dust of centuries upon it, intermittently disturbed by the encroachment of a now and then strolling tourist, or the villagers' friends. The heavy old oak door at the bottom, redolent of the past, with its rusty hinges, croaks noisily as it is pushed open, as if in protestation at such unseemly intrusions.

The construction is of half timbered work, and the massive beams supply ample testimony of the difference between modern scientific calculation and old-fashioned ignorance and lavishment.

The principal room, which is situated immediately over the gateway, is of a good size, with a casement window and panelled walls. The mantel and fireplace are of carved oak, with a large rusty dog-iron grate, and several antique swords and pistols of the seventeenth century hung over. The floor is also of oak, and the whole appearance of the place, with its decaying smell, seems to take one back to the time when those swords and pistols were lying ready to the hands of that desperate band, who carried their lives in their hands at these clandestine meetings.

The reason the "rendezvous" was appointed here was because the leader, Sir Robert Catesby, lived in the house adjoining, known as "Ashby Ledgers," and which was approached by this same gateway, which constituted, in fact, part of the stables belonging to it.

The derivation of the name "Ashby St. Ledgers," or "Ashby Ledgers," as it was then called, may prove of some slight interest. "Ashby," or "Ascebi," comes from the Saxon "Arc," an ash tree, and *bye* a dwelling or habitation; "Ledgers" after the patron saint Leodegarius of the church adjoining.

The house is a charming and interesting old place, dating as far back as 1187 to the reign of Henry II. It was possessed by the Catesby family for several centuries previous to the Gunpowder Plot, and the first recorded historical incident connected with it, is that Sir Wm. Catesby, the favourite of Richard III., was taken at the Battle of Bosworth, 1485, and executed nine years afterwards. His grandson, also Sir Wm. Catesby, was next cited before the Court of the Star Chamber for harbouring Jesuits in the reign of Elizabeth, and condemned in 1581.

Sir Robert Catesby, his son, lived here for some time with his mother, although he was not actually born in the house, and eventually became notorious as the instigator and leader of the Gunpowder Plot Conspiracy in 1605. How this diabolical scheme was happily frustrated is common knowledge; suffice it to say that Sir Robert and some of his infamous accomplices escaped to Holbeach King's Swindon, in Staffordshire—a house belonging to one of the doomed band—where after a desperate stand they were shot down November 8th, 1605.

Guy, or Guido Fawkes, *alias* Johnson, the

man mostly associated with November 5th, and to whom the task was allotted to fire the train, was a foreigner, and formerly an officer in the Spanish Service. He and the remaining conspirators were captured and executed in London.

Curiously enough the Secretary of State at that time was Lord Salisbury.

After the Catesbys the house passed into the hands of the P'Anson family, from them to the Ashley family, and then by marriage to the Senhouse family, in whose possession it still remains.

"Next door," as one may say, stands the church, a stone building, chiefly in the perpendicular style; it contains a monument erected to the memory of Sir Wm. Catesby, the favourite of Richard, III., consisting of effigies in Heraldic costume.

Of the house itself a little more must be said.

It is built of stone in the early English style, and it is supposed about the year 1187, but the principal part of the existing structure, viz., the west and south fronts, were built in the reign of Edward III., between 1336 and 1360; architect unknown.

The dining-room or south end was restored by "Brian P'Anson" in 1652, and the east front by the late Capt. Senhouse in 1852.

There is a tower at one end with a stone balustrade; and the stone gables, battlements, and balustrades, in all their colours of weather-beaten richness, present a charming appearance, and, despite the restoration it has at times received, it is a good example of the Architecture of its time.

The interior is in parts as altogether charming as the exterior. It has a spacious entrance hall, with oak-panelled walls, on which hang antique swords, pistols, and blunderbusses, while in a corner one is confronted by a knight in full armour. The dining-room is a charming room, also oak-panelled from floor to ceiling, with two large, stone-mullioned bay windows, and a handsomely carved oak mantel, in which is incorporated the coats-of-arms of the families.

Out of a separate chamber an open newel staircase, in massive oak, with carved newels and banisters of very bold and beautiful design, leads to the floor above.

The garden completes the harmony of the whole. In one corner there are four stone statues, emblematical of the seasons, surrounding a large figure of "Atlas," with his heavy burden, while the main entrance is beautified by its "Guardian of Stone."

Innumerable sun dials are dotted and scattered about, and an old terrace with its decaying lichen-carressed stone in all its rich and beautiful colour-tones, over which like a sentinel hangs a gigantic mulberry tree, add additional charms and quaint notes to this already old-world corner.

THE corner stone of the new district church for the parish of Holy Trinity, Worthing, which is to be erected in Tarring Road, at a cost of between £3000 and £5000, has just been laid.

A ZÜRICH correspondent writes under date October 22nd:—"The cantonal authorities of Argovie have completed the restoration of the Schloss Habsburg (*lit.*, Habichtsburg, the Castle of the Hawk), near Schinznach, on the Aare. The castle was built by Werner, Bishop of Strasburg, of the Hapsburg family, in 1027. This was in the thirteenth century the seat of the first Rudolph von Hapsburg, Count of Argovie, the favourite of the Emperor Frederick II., and Governor of Lucerne, Zug, Glarus, &c. He was the founder of the Hapsburg dynasty. The building, which had descended to the low estate of a farmhouse, has now been restored to some resemblance of its historic past. The windows have been filled in with stained glass bearing the arms of Austria, the fine oak carving on walls and ceilings freed from its ancient coatings of plaster and whitewash, and the exterior woodwork of the house painted with the Austrian and Swiss national emblems and colours. It is intended henceforth to preserve the building and grounds as a national monument."

SPAIN: Its Picturesque Cities and Monasteries.

V.—THE MONASTERY OF SANTAS CREUS.*

By F. HAMILTON JACKSON, R.B.A.

(Continued from page 181.)

BEYOND the refectory is the Royal Palace, which was built by Pedro III. and Jaime II., the latter of whom used it as a royal residence in his frequent visits to the monastery. One enters through a plain doorway a sort of vestibule, 24ft. by 15ft., with a wooden roof painted with the arms of the house of Aragon and of the abbot under whose abbacy the building was erected. From this vestibule one enters the *patio*, which is Gothic, and very fine both as Architecture and workmanship. It is about 24ft. square. In the centre is a well of excellent water, which was covered by a 17th century well-head, but most of this work has been destroyed. On the right a staircase ascends to the first floor, the handrail of which is supported by two flying arches which meet in the middle upon a porphyry column.

The clustered columns supporting the arches rest upon this column, so that the arcade is regular all round the *patio*. The handrail and the edges of the steps are moulded, and at the bottom of the rail is sculptured a little group of crouching animals.

Above the inside of the door is carved the shield of Aragon, supported by two flying angels. The gallery occupies the

* The Chapter House at Santas Creus is singularly like that at Poblet, and we give an illustration of the latter for purposes of comparison.

other three sides of the *patio*, being placed above a very flat vaulting. It consists of a low parapet which serves as base for eleven slender marble columns, the well-carved capitals of which sustain moulded pointed arches and a thin wall. It has a flat ceiling made of wood, and panelled, and painted in the same way as the vestibule. Some time after the erection of this gallery a second story was added, the weight of which, being more than the architect had calculated on, produced cracks, and other signs of ruin. After buttresses and various mendings up and alterations had been tried without success, in 1892 the second story was taken down, thus restoring the design to its original state. The rooms to which this gallery leads are not of any special interest. There were two other doors on the ground floor, one communicating directly with the exterior, and the other with the refectory. After the Kings ceased to make use of this palace it became the residence of the Abbots until 1562, when the palace in the outer cloister was erected. At one end of the building is a tower called "El torre del Homenaje," "the tower of the homage," because in it Don Fray Jaime de Aragon, the eldest son of James II. was shut up by his father, before he became a monk, as a punishment for the rebellious and disgraceful acts by which he embittered the last days of that distinguished monarch.

Beyond the ancient cloister and to the left is an interior court which contained the earliest buildings of the monastery in which the monks lived while the church was building, together with the principal dependencies prescribed by the statutes of the order. Of these buildings the only one now remaining is the Chapel of the Holy Trinity, commonly called that of St. Bernard, in which the religious rites were performed. It is but 30ft. long by 17ft. broad, and is perfectly plain. Close beside it there still remained until a few years ago the room of the Queen D. Petronilla of Aragon, with a window screened by a grating through which she could assist at the mass in the chapel.

This room had a rich *artesonado* ceiling, but all has now perished, together with the other buildings, which were used as an infirmary, with its dispensary and chapels, &c., and as dwellings for the aged monks who were not obliged to conform to the strict rule of the order. There was also a tailor's shop here for necessary repairs to the clothes of the community.

On the first floor, above the Chapter House, was the dormitory for the young monks, and the library. The former is 141ft. long by 34ft. broad, and had a roof, now restored, supported by eleven slender pointed stone arches moulded at the angles. It was built at the end of the twelfth century, and D. Petronilla, the widow of Ramon Berenguer IV., gave a sum of money towards it in 1173, and from 1175 set aside the produce of a garden and a vineyard for the same purpose. The cells were 12ft. by 8ft., each lighted by a small window, and were ranged in rows along the walls, leaving a broad passage down the centre. The traces of them were only destroyed in 1870, when the dormitory was prepared to house the prisoners of Tarragona during the epidemic of fever of that year. Until that date the cell occupied by San Bernardo Calvo for a long time was preserved and much venerated. The library is situated to the south of the monk's dormitory, and is entered from it by a staircase of two flights meeting on a platform before the door. It is a rectangle of 36ft. by 22ft., with a rich *artesonado* ceiling, finished with a beautiful cornice. This library was very rich in manuscripts and early printed books, most of which have disappeared, though a few are preserved in the public library at Tarragona. The manuscripts were of the thirteenth, fourteenth, and fifteenth centuries, and in several languages, among which were Greek and Provençal.

The printed books included more than 150 in Latin and Spanish—some of which came from the presses of Basle, Florence, Ferrara, and Venice, the earliest date being 1499.

MONASTERY OF SANTAS CREUS: INTERIOR OF CHAPTER HOUSE. SKETCHED BY F. HAMILTON JACKSON, R.B.A.

Staircase in Royal Palace
Monastery of Santas Creus

SKETCH AT A SPANISH MONASTERY: BY F. HAMILTON JACKSON, R.B.A.

They formed part of the library of the Archbishop of Tarragona in 1594, who left most of his books to the Escorial, but a doctor of the town bought these after his death and left them to the monastery.

The monastery of Santas Creus, like that of Poblet, had the honour of being the last resting place of kings of Aragon and magnates of Catalonia, the majority of those distinguished monarchs who governed Aragon, Catalonia, and Valencia, and of the equally distinguished heroes who assisted in the heroic deeds of the Moorish wars being interred in one of these two monasteries. The important royal sepulchres are those of Pedro III., called "El Grande," and James II., which stand in the transepts one on each side of the nave, touching the piers of the crossing. The monument of the former is on the left of the spectator when facing the high altar, and is a work of the end of the thirteenth century.

The monarch died at Villafranca de Panades in 1285, and was translated to Santas Creus in 1300. The tomb consists of a slightly oval porphyry coffin said by some to have been a bath in a Moorish king's palace at Majorca, by others to have been a trophy of war brought by Roger de Lauria from Sicily. It rests upon crouching lions of marble, somewhat in the Italian Romanesque manner, and is covered by a richly carved Gothic cover of a tabernacle form, with canopied niches at the sides, tenanted by figures. It is 7 ft. 6 in. high, and stands beneath a canopy of the

height of 23 ft., which is rectangular in plan, and consists of ten slender columns of jasper which sustain large traceried arches crowned with finials and with pinnacles at the corners. The tracery consists of three sexfoils above three trefoiled arches, the external mouldings of each member being simple circles, and pointed arches of unequal height. On the shorter side there are but two arches, and the sexfoils become quatrefoils. At the base of the pinnacles at the angles the symbols of the evangelists project, gargoylewise. The capitals are delicately and beautifully cut, and the mouldings well considered, though rather later in effect than the date of erection would lead one to expect. In Don Pedro's will, after ordering that he should be interred in this monastery, he set aside 10,000 "morabetines" of gold for the expenses of the "assistance" and the construction of the monument. On one of the pilasters is a time-worn stone bearing a sepulchral inscription which runs thus: "Peter, whom this slab covers, subdued nations and kingdoms and cast down the mighty; he made much noise in the world. He realised all his enterprises, he made his soldiers brave and magnanimous. He who was first in war now humbly lies here. Constant to his proposals, true in his speech, and faithful to his promises was he, and valiant in arms; governing strongly with equal justice for all he was praised by them, but his energy of character was above all praise. He adored Christ by means of

repentance from which he received happiness. May the Virgin Mary be his pious conductor." Surely a character worthy of honour and capable of great deeds. The lid of this tomb was raised in 1857 sufficiently to show that the body of the King was still there, clothed in a monk's habit.

In the other sepulchre in the opposite transept are buried James II. and his wife, D. Blanche of Anjou. The monument is a good deal like that of his father Don Pedro, but is much more ornate, and the tomb itself is Renaissance in style. The traceries are composed of quatrefoils throughout, the external arches are crested with crockets, the finials are more elaborate, and there is a central pinnacle with open arches crowning the edifice. On the lid of the sarcophagus are effigies of the two persons buried within, the whole being carved with great delicacy, but being a little out of harmony with the canopy owing to the difference in style. It was executed by Bertram Riquer, the architect of King James's palaces, in 1312, about two years after the death of the Queen. The King's epitaph is modelled on that of his father, but is longer and more grandiloquent. I quote a part of it—"He was not lazy in subduing kingdoms, and he subdued Murcia and Cerdeña. He ruled at one time five kingdoms in one place and another; he gave back three without ransom, only preserving the dignity of Signory—he was humble hearted, pure from the miserableness of sin, pitiful, pure of spirit, eloquent, just in his judgments and valiant in war and in the use of arms. Of a joyful countenance and not melancholy, easily appeased and modest he deserved to be called 'the pacific,' for he was a friend to peace. He now has the Kingdom of Heaven for having faithfully confessed his Lord. May He who governs all things pardon him all which he did without malice." He died in 1327 at Barcelona, at the age of sixty-five, where his body remained until 1410. The following royal personages were also buried at Santas Creus, but the occurrences of 1835 destroyed their tombs. D. Margarita, second wife of King Martin, *El Humano*, who was abbess of the convent of Bon Repos after the death of the King. In 1473 this convent was abandoned, and the ashes of those who had been buried in the garth were translated to Santas Creus—the Infante Don Fernando Sanchez, natural son of James I., the founder of the noble house of the Castros of Aragon; the Infante Don Fernando, Marquis of Tortosa, son of Alfonso the Fourth and Leonor of Castile, and the King Don Alfonso III. of Aragon.

Among the great men who are buried in the monastery may be mentioned first the celebrated Admiral Roger de Lauria, to whom is attributed the saying "that he would stop the fishes even, in the Mediterranean, who did not bear the arms of Aragon." He died in 1305 at Valencia, and in his will directed that he should be buried near to his Sovereign, having been with him in life in his glorious undertakings. He lies within a shallow grave on the right of King Pedro's tomb, covered with a slab bearing his arms. From the inscription the line bearing his name has been obliterated. Close to the door into the cemetery in a sepulchre supported by five columns are the mortal remains of the Baron Arnaldo Guillermo de Cervello and his wife, one of the Castro family, barons of Llacuna. It is thought that during the restoration of this tomb it was made into a resting-place for the other remains of royal and historical persons scattered to the winds during the disturbances of 1835. In the nave is a pretentious monument put up in 1756, with white and coloured marbles, containing the bodies of ten or more members of the families of the Moncadas and Medi a Celi. It bears a long and pompous inscription stating that the Duke of that period had collected the bones of his ancestors into this tomb so that his duchess might rest more comfortably among them! In the centre of the nave is a stone bearing this inscription: "Here rest the bones of the nuns of the destroyed convent of Bon Repos of the holy Cistercian order, translated to this monastery of Santas Creus, hoping to be translated to a better resting place."

In the cloister are numerous tombs set in semi-circular niches made in the walls. They are most of them much the same in character, a sort of chest of stone carved with more or less elaboration on the front, and with a ridged lid upon which is sometimes set an effigy of the person who rests within.

The first of these which we encounter on the south side is that of Don Ramon Alemany de Cervello, who died in 1229, and was buried here in 1285. He was one of those who most distinguished themselves in the conquests of Majorca and Valencia under James I. His tomb has six niches on its face with two figures in each, a range of twelve shields bearing stags filling the spaces between the canopies and pinnacles. Upon the cover is a recumbent figure about the size of life of an armed warrior whose feet rest upon a lion. A little further on is a somewhat similar tomb, which contains the remains of Don Bernardo de Salvo and others of his family. This tomb has a recumbent figure clad in monastic garb on the lid, and the front is ornamented with sunk quatrefoils, the centre one containing a crucifix and the other two the family arms; it dates from the fourteenth century. On the wall to the left of the chapter house is the tomb of two members of the family of Aguilo, barons of Talavera. This family was descended from Don Ramon de Aguilo, great grandson of Yolt de Cervera, one of the nine barons who aided the Catalans in the war of the reconquest. Robert de Aguilo, called El Bardet, who was prince of Tarragona, was of this family. Close by is a tomb, supported by brackets, which contains the remains of two marquises of Barberá, of the family of Pinos, the descendants of another of the nine barons. The Admiral Galceran de Pinos who was made prisoner by the Moors in 1147 in the war against Almeria, but escaped after five years captivity, also belonged to this famous family, and next to this is the Moncada tomb, which still contains the remains of the brothers Don Guillermo and Don Ramon, who died in 1229 during the conquest of Majorca, though most of the bodies interred there were removed to the Medina Celi monument in 1756. It is a Romanesque tomb with little twisted columns, between each two of which are four circular plaques. The cover is divided into many compartments, which contain various shields, cows, and castles. The Moncadas were descended from Dapifer, another of the celebrated nine barons, who, having distinguished himself in the taking of Monte Catheno, took the name of Moncada, derived from it they say.

In the Chapel of the Assumption is the tomb of the foundress, D. Magdalena Salva de Valls, the slab covering which shows in relief her figure robed in the Cistercian habit. Several similar slabs are in the floor of the chapter house, among which may be mentioned one of 1366 showing a bishop with chasuble, mitre, and crosier, and others showing the abbatial costume. In the next walk is the Cervello's tomb, in which five barons of Llacuna lie buried. This family is descended from another of the nine barons, Raimundo de Cervello. The family of Cervera has two tombs here, they were descended from Yolt de Cervera already mentioned, a descendant of the Dukes of Saboza, who in the time of Charlemagne gained the estate of Cervera, acquiring at the same time the lordship of Castillo. Close by is the tomb of the family of Queralt, dating from 1288. The founder of this family was also a grandson of Yolt de Cervera. A little further on is the tomb of the "Unconquered Amazon," D. Guillermina de Moncada, wife of Don Ramon de Cervello. She was so called because when her husband was taken prisoner by the Moors she undertook a campaign against them which resulted in his liberation. The tomb is Renaissance in style with a shield on its cover. The front is divided into three parts, the centre of which contains in relief the equestrian statue of the warlike lady clothed in mail and with sword and spur.

Among these tombs of the valiant and noble is a slab of marble fixed in the wall close to the eastern door of the church, which records that "here lie the remains of him who in life

was a chemist in Barcelona, Pedro Judice, who died in 1315." One more tomb may be mentioned, that of the family of Montoliu, the lords of Renan and Bon Repos, which had its origin in Germany, and whose representative in the eighth century accompanied Louis the Pious to Catalonia. The style of all these is similar, the front being panelled with foiled panels of various shapes, often with shields within them bearing the arms of the various families, and with a gabled top, often also panelled, and I have gone through the catalogue at such length because of the historical interest of the names; though it is difficult to be critical in this beautiful quiet cloister, with the sun striking down through the slightly leaved trees in their tender spring green, and with the feelings stirred by the knowledge that the dust of many of the noblest warriors who fought successfully against the Moors and drove them from this part of Spain lies around one.

On the last page of a fourteenth century manuscript book which is preserved in the library at Tarragona, and which came from this monastery, is a Latin note giving the dates of construction of some of the most important buildings. This note says that the church was commenced in the month of September in the year 1174 "to the honour of the Virgin," that in 1191 the first stone of the foundations of the dormitory was laid, and that on Whit Sunday in the year 1211, about three o'clock, the convent was transformed into a new church, Don Bernardo the abbot presiding, with forty-five monks. In 1302, on St. John Baptist's day, the refectory was commenced. In 1313, on the 13th Sept., the first stone of the foundations of the cloister was laid, and it was finished in 1341. This was written by Fray Bartolomé de la Darnosa in June, 1367, the dates being taken from ancient books belonging to the monastery. On the 1st January, 1376, the walls round the church, the cloister, and the dormitory were begun as a sort of relief works on account of the famine, which was the most severe of the century. These works went on till February 23, 1378, at

which time the scarcity had passed away and they no longer hurried over the work.

Among the relics preserved in the monastery was one called the "holy hand." The story of this relic was as follows: Two monks who were friends agreed that whichever survived the other should pray for his friend's soul nightly by his tomb. One died, and the other according to his vow went to say a *De Profundis* every evening in the cemetery. - One evening as he rose after giving the benediction he saw a hand on the ground which repeated his actions! As this prodigy occurred not once but many times the monk reported it to the abbot, who, with the rest of the community, went to the cemetery at the right time and entreated the dead saint to allow his hand to be preserved as a memorial of the miracle. A cross of stone was erected in the cemetery on the spot where it appeared.

LEITH ACADEMY, built at a cost of £33,000, exclusive of the site, has been formally opened by Lord Reay.

SIR WILLIAM HARCOURT, Bart., has opened at Aberystwyth the new central block of the College buildings.

AFTER extensive repairs lasting over more than two years, the church of St. Mildred, Bread Street, has been reopened for worship. The church is one of the finest examples of Wren's interior Architecture, with its extremely handsome cupola and rich decoration, and was opened in 1683. Very wisely, the fine old oak pews have been preserved, as well as the panellings and altar piece, with its quaint pictures of Moses and Aaron. The carving of the pulpit and sounding-board is superb, and is attributed to Grinling Gibbons and his pupils. In the course of some previous alterations the beautiful carved altar rails of Charles II. work were removed, and arranged round the font, but have now been restored to their original place, and many other improvements have also been effected to render this one of the brightest and most characteristic of City churches.

AT THE MONASTERY OF SANTAS CREUS: TOMB OF D'RAMÓN DE CERVELLO.

THE MONASTERY OF POBLET. INTERIOR OF THE CHAPTER HOUSE.

GLAMIS CASTLE.

A MYSTERIOUS CHAMBER.

THERE are few stories of haunted chambers in ancestral castles better known than that which is connected with Glamis Castle. Several variants of the tale are given; but these all have in common the notable peculiarity that the location of the mysterious chamber is unknown. A writer in Chambers' Journal offers an ingenious solution of the much debated question. An examination of the evidence (says the writer) shows that the oral tradition was in existence about a century ago, and that the earliest printed record dates for over seventy years. Earl Beardie was dead three centuries and a half before the former time, yet his name may have survived as a nursery bugbear, just as that of the Black Douglas was used to terrify children in Sir Walter Scott's early days. The evil reputation of Earl Beardie was a local Forfarshire superstition long after he had gone to receive the reward of his misdeeds. A story, therefore, which had any mystery connected with it would naturally be associated with his name. Hence the secret chamber at Glamis need not have been constructed previous to 1454—the date of Earl Beardie's death—so as to link his name with it. Indeed, it is far more likely to be an erection of a much later date, when the name of the "Tiger Earl" had been canonized in an evil sense. It may here be explained that many structural curiosities at Glamis Castle have been only recently discovered. A

SPLendid FIREPLACE IN THE DRAWING ROOM, which was not known to exist, was accidentally found a few years ago; and a secret staircase, which appears to have been built about 1670, had been closed up, and was discovered in 1849, when some alterations were in progress. The principal renovator of the ancient Castle of Glamis was Patrick, first Earl of Strathmore, who was born in 1642 and died in 1695. In the "Book of Record," written by this Lord

Strathmore, and published by the Scottish History Society in 1890, he gives very full details of the work done by him at Glamis Castle. For instance, the construction of this back staircase, so long forgotten, is distinctly described; and from his references to certain leaden statues which he had erected in the grounds, these works of art were recovered from their undignified seclusion in some of the cellars, and have been restored to their original positions. When confronted with a mystery like that of the secret chamber, one naturally turns to the "Book of Record" to see if it contains any allusion to this apartment. The diligent student of that remarkable book will find two curious entries that seem to have some bearing on this subject. Writing on June 24th, 1684, Lord Strathmore records the following transaction:—"Agried with the

FOUR MASONES IN GLAMMISS

for digging down from the floor of the lital pantry off the Lobbis a closet designed within the charterhouse there, for wch I am to give them 50 lib. scotts and four bolls meall." The work of constructing this closet or small chamber was more serious than the earl had contemplated. Judging from similar chambers which he caused to be made at his other residence at Castle Lyon (now Castle Huntly) in the Carse of Gowrie, the closet was probably dug out of the thickness of the wall. On 25th July there is another reference to this closet, which shows that its construction was an arduous undertaking:—"I did add to the work before mentioned of a closet in my charterhouse severall things of a considerable trouble, as the digging thorow passages from the new work to the old, and thorow that closet againe so that as now I have the access off on flour [one floor] from the east quarter of the house of Glammiss to the west syde of the house thorow the low hall, and am to pay the masones, because of the uncertainty yrof dayes wages, and just so to the wright and plasterer." From these precise entries it is plain that in 1684 the first Earl of Strathmore caused

A SECRET CHAMBER

or closet to be constructed, with an entrance from the charter-room. This was by no

means an unusual thing, for many noble Scottish families have had frequent occasion to conceal documents that would have compromised them in times of war, and even a charter-room might not have been secure against the searches by enemies. The first Lord Strathmore, himself, for instance, was deeply implicated in a Jacobite plot with the Earls of Southesk and Callander in 1689; and though he afterwards became reconciled to William III., it would be useful for him to have a secure hiding-place for treasonable papers. Several of his descendants were concerned in the risings of 1715 and 1745, and a chamber of this kind would be useful either to secrete documents or to afford shelter to a fugitive. The third Earl of Strathmore died of wounds he received at Sheriffmuir in 1715. By that time the masons who had constructed the secret chamber thirty years before would have passed away, and the lingering rumours of its existence would be linked in popular mind with the mysterious Earl Beardie. For obvious reasons the successive Earls of Strathmore would not seek to dispel this superstition, and thus the simple "closet designed within the charter-room" has been elevated to the dignity of a haunted chamber. At least this suggestion is a reasonable one. Certainly the secret of this mysterious closet has been faithfully kept alike by the Earls of Strathmore and their factors. In the middle of last century this secrecy was of vital importance. It has since become habitual and traditional.

THE roof of a church in the Faubourg de Santa Lucia, Verona, Italy, while undergoing repairs, fell in. Several lives were lost.

An extraordinary scene was witnessed at Feltwell, in Norfolk, where the tower of St. Nicholas' Church has been under repair, and girt round with scaffolding. Suddenly, while the workmen were at breakfast, the tower swayed and then fell with a tremendous crash into the churchyard, wrecking gravestones, filling the place with rubbish, and sending up clouds of dust. The belfry contained a fine peal of bells, which were scattered in all directions.

THE NEW THAMES BRIDGE.

THREE score years and twenty is by no means the allotted span of a bridge, yet that is the age of the structure crossing the river at Vauxhall, which is now in process of demolition. It is not that the bridge is too old, it is young as bridges go, but, like much else in these go-ahead times, it has outlived its days, and it is now being sacrificed to make room for a bridge more in keeping with the requirements of a neighbourhood concerned with something more than a pleasure garden, and of a traffic which does not consist of the equipages of the rich and the fashionable alone. And so now that a temporary bridge has been thrown across the river to accommodate the diverted stream of traffic, old Vauxhall Bridge is in the hands of the destroyer. Already its sides are stripped of their iron palings, the roadway is in a state of upheaval suggesting the effects of an earthquake, and broken iron plates and girders (all cast-iron, a relic of engineering methods gone for ever) are piled up ready for the melting-pot. It is estimated, says the *Globe*, that over two thousand tons of scrap-iron and

NINE THOUSAND TONS OF STONE

from the old piers and abutments will have to be removed by the contractors, Pethick Bros., of Plymouth, before they are in a position to commence the work of rebuilding. Vauxhall Bridge seems destined to mark important changes in Thames bridge construction, for that now speedily disappearing was the first iron bridge thrown across the river, and the one to be put in its place will be the first concrete bridge ever built over an important river in this country, and at the same time it will, we believe, constitute the first notable attempt at bridge construction by the London County Council. Considerable interest therefore attaches to the work, and the novel methods (now made public for the first time) by which the old structure is to be removed, and its successor placed in position, will tend to enhance the interest which the expert may be expected to evince in so important an undertaking. On the Continent

CONCRETE BRIDGES

are no novelty; they are in use over the Seine, in Geneva, and in other places, and have been found to perform admirably all that is required of them, but the fact that the traffic over a London bridge is far greater and heavier than in any Continental city is one not to be lost sight of, and gives additional importance to this first experiment of Sir Alexander Binnie in concrete bridge building on the Thames. One great advantage, it appears, of this kind of bridge is the greater rapidity of construction and the saving of expenses (chiefly in labour) which is involved in bringing stone from a considerable distance and hauling it into position. Concrete can be made on the spot, as it were, and while being much more easy of treatment in the process of construction, is claimed to possess all the strength and durability of granite. It need hardly be said that only the heart of the piers and arches will be of concrete, the external portion of the structure being composed of more imposing material—in this case

SCOTCH GRANITE.

Waterloo Bridge (a granite structure) is said to be the finest of our bridges looking at it from an architectural standpoint, and in the new Vauxhall Bridge an attempt will be made to build on the Waterloo lines, at the same time rendering it more light and attractive in appearance. Many attempts were made to bolster up Vauxhall Bridge before its obvious unsuitability for present needs, and the urgent demands of those in the district it serves, came to be recognised. The bridge, opened in 1816, was built by a private company chiefly for the convenience of the fashionable world, which made Vauxhall Gardens a rendezvous. With its surrounding market gardens and fields there was then no thought of such a traffic as has of late years rendered Vauxhall Bridge, with

its 24ft. carriage way, at times quite impassable. It was more suited to its earlier purpose; indeed, over £250,000 was spent on its construction; albeit it was purchased some twenty years ago by the Metropolitan Board of Works for £75,000. Not only the traffic over, but that under the bridge has, of course, increased enormously since 1816, and the fact that the bridge has nine arches, and that its piers occupy about one-sixth of the waterway, has rendered it a source of danger to navigation, particularly as the ebb tide is often given to running here at a surface velocity of $7\frac{1}{2}$ miles an hour. The deepening of the river bed in the process of time had exposed the foundations, and about ten years ago an attempt was made to protect them with blast slag and cement, but the current soon commenced to play havoc with the protective works. It became dangerous for any load weighing more than ten tons to pass over Vauxhall, whereas the new bridge will be allowed to take a weight of over thirty tons. It may be mentioned that Westminster Bridge, considered by many to be the handsomest of the London bridges, can only take fifteen tons (the new Vauxhall will be almost as wide as Westminster), and that the safe capacity of Lambeth Bridge, which is guarded day and night by men who are ready to close it at any moment should a crowd assemble, such is its want of strength, is but three tons. The removal and

RECONSTRUCTION OF A BRIDGE

must necessarily impede to a considerable extent the traffic on the river itself, and any method which will tend to lessen the inconvenience must confer an undoubted benefit on those who use the great waterway. Messrs. Pethick claim to have hit on a plan which, while conferring this benefit, will at the same time expedite the work of demolition and rebuilding, more especially having regard to the fact that the piers of the new bridge (and it is only with the structure up to what is known as the spring line that the present contractors are concerned) are to be of concrete, faced, as already stated, with granite. The work is to be carried out with the help of a "Blondin railway"—overhead cable trucks—the idea very naturally being taken from the granite quarries of the North, to which recourse is to be had for the stone. There these cable cars are used to lift the granite out of the deep quarries and convey it to the railway trucks or lorries. On each side of the river a mast 90ft. high will be erected, carrying a cable of 1000ft. span and $2\frac{1}{2}$ in. in diameter. A truck running on the rope will be able to convey from three to four tons of the

DEBRIS OF THE OLD BRIDGE

or of material for the new structure, along the whole extent of the span in less than two minutes. There is talk of having two cables. The trucks can be lowered to any level from the cable line, so that there will be no difficulty in getting down to the foundations of the bridge, which are to be laid 25ft. into the bed of the river, going into the London clay, a somewhat different plan from that of the present structure, the foundations of which are built on a wooden platform not more than 3ft. below the river's bed. The task of building the new piers will be carried on, not in iron caissons, the usual method, but in coffer dams constructed of grooved piles, to ensure their being watertight. There will be only four spans to the new bridge, half the number of the old, but the greatest width between the five piers which will replace the nine of the old structure, would admit of three steamers passing under abreast. The parapets will be 89ft. apart, whereas old Vauxhall measures but 36ft. across, and the length of the bridge is put down at 1000ft., against 809ft., the present distance between abutments. The method of construction, as revealed in the bridge now in process of demolition, compared with that to be adopted in the new Vauxhall Bridge, affords striking evidence of the advance in a single department of engineering science during the present century, and it is believed that the architectural proportions of new Vauxhall will show an equally notable improvement.

The Society of Architects' Examination.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Mr. Arthur Cates was for so many years intimately connected, as Chairman of the Examining Board, with the R.I.B.A. examinations, that one naturally listens to him with respect when dealing with this subject. His letter in last week's BUILDERS' JOURNAL is consequently all the more to be regretted, in its effort to stir up a non-existent conflict between the Institute and the Society, to prove that the R.I.B.A. exam. meets all cases—which it is far from doing.

The Society provides a single qualifying examination, which the R.I.B.A. does not, for all assistants, whatever their age, and whether they be chief assistants or those holding comparatively junior rank.

The Institute limits are severe, often anomalous, and in a large number of cases quite prohibitive. The triple examination scheme is most excellent; but it can only apply to the younger men of leisure and means. The scheme of a single "Special Examination" is only open to the few, owing to the restrictions imposed.—Yours, &c.,

G. A. T. M.

Oct. 28th, 1898.

The "Bitter Cry" of the Outcast Architectural Assistant.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I thank your correspondent "A.R.I.B.A." for his letter, and I trust that it may result in much prominence being given to the mere pittance paid to fully qualified architect's assistants. From my experience the Profession is not overcrowded, but is the worst paid under the sun, and it is quite time that assistants should speak out and demand a larger salary from their employers, for I question very much whether in any trade or other profession an employer makes so large a percentage of profit out of his employees as an architect and surveyor does out of a fully qualified assistant.

Do we assistants fully realise how much our employers make out of our services in a year? I think not, or we should never submit to the usual two guineas a week salary, for which we are expected to be competent in all branches of the Profession.

May I be permitted to refer to myself. I am chief assistant to a firm of architects and surveyors in the provinces, and receive a salary of £2 10s. per week after having been in their employ four years. The greater portion of the working and detail drawings are prepared by myself, and, in addition to writing specifications, superintending works, &c., &c., I take out all the quantities. During the last twelve months I have taken out quantities for different buildings, the contracts of which amount roughly to £24,000, for which my employers receive—at $2\frac{1}{2}$ per cent. commission—£600. The time I put upon those quantities would altogether amount to about twelve weeks, which at £2 10s. per week comes to £30, and this is all I receive out of £600 going into my employer's pockets. I contend that an assistant who puts at any rate a clear £550 into the pockets of his employers in three months, would, if he were fairly paid, be receiving a salary of at least £5 per week.

Some of your readers may say: Why not get a better berth? but I am afraid that were I to change I should not get more than £2 15s. per week, which is regarded by most architects as a very liberal salary.

I think that before we can expect any alteration as to our wages we shall have to combine in some way or other, and I hope that something practical may result from this correspondence. Apologising for taking up so much of your valuable space, I am, sir, yours faithfully, PROVINCIAL ASSISTANT.

THE strengthening of the venerable tower of St. Peter's Church, Liverpool, which also serves as the Pro-Cathedral of the diocese of Liverpool, continues.

DWELLINGS FOR THE POOR.

SOME LOCAL GOVERNMENT BOARD REQUIREMENTS.

THE Local Government Board has imposed such requirements upon the Lincoln Corporation that the latter has been obliged to drop its scheme for the housing of the working classes. Particulars of the scheme and the criticisms are contained in the following report, prepared by the City Surveyor: (1) On November 25th, 1897, the Sanitary Committee approved a scheme for the erection of 30 houses, viz.: 14 houses to cost complete £195 each, at a proposed weekly rent of 5s.; 11 houses to cost complete £148 each, at a proposed weekly rent of 4s. In addition to the above there were five houses specially designed to meet the exigencies of the site. On December 7th, 1897, the Council considered the above scheme, and deeming the rents too high referred the matter back to the Sanitary Committee for reconsideration. (2) On December 29th, 1897, the Sanitary Committee approved of

A REVISED SCHEME

for 40 houses, viz.:—12 houses to cost complete £168 each, at a proposed weekly rent of 4s. 8d.; 26 houses to cost complete £132 each, at a proposed weekly rent of 3s. 4d. In addition to the above there were two houses specially designed to meet the exigencies of the site. On January 5th, 1898, the Council approved this revised scheme, and authorised application to be made to the Local Government Board for the necessary loan. (3) In reply to this application a communication dated April 5th, 1898, was received from the Local Government Board and considered by the Sanitary Committee, together with the Surveyor's reports thereon, dated April 12th and 19th, when they authorised the amended plans to be returned to the Local Government Board. The cost of the emendations, consisting of

ADDITIONAL DRAINAGE DETAILS,

provision of bedroom fireplaces, skylights over staircases, and extra thickness of passage walls, was estimated at £200. (4) The Local Government Board inquiry was held on 22nd July, 1898. (5) A further reply, dated 22nd August, 1898, was received from the Local Government Board, wherein they ask for the site to be covered with cement concrete (which was also to be placed round all drains), for all bedrooms to be made a minimum size of 80 square feet, and for the provision of a depth of open space of 15ft. at the rear, instead of 10ft. as required by the Building Committee. It should be understood that all the requirements of the Local Government Board are over and above those insisted upon by the Corporation when approving plans.

THE ADDITIONAL ESTIMATED COST

of the above is £458, but it must be distinctly understood that the scheme now only consists of 37 houses (instead of 40), three having to be eliminated to provide the additional open space, and the increased size of bedrooms. The estimated cost will therefore now stand as follows:—12 houses to cost complete £189 each, at a proposed weekly rent of 5s. 3d.; 23 houses to cost complete £153 10s. each, at a proposed weekly rent of 4s. 3d. Part of the additional cost is owing to the statement of the Local Government Board inspector, that it is against their regulations to allow more than 30 years for the repayment of the loan for the buildings, whereas the former calculations were based on 40 years. The total amount required to be borrowed (if this last amended scheme is carried out) will be £6900, as against £6500, though three houses less are to be built as mentioned above.—The above report has been considered by the Sanitary Committee and by the City Council in Committee of the whole. It was resolved to inform the Local Government Board that they consider the Board's later conditions unnecessary and unreasonable, and that, in consequence, as the object was to build decent houses for the working classes at low rents without cost to the rates, the Council will be compelled to abandon the scheme.

COGAN OLD CHURCH.

COMPARATIVELY few people visit the Parish Church of Cogan, though many are familiar enough with the new church that stands in New Cogan to the left of the road on ascending the hill into Penarth. The Parish Church lies in the midst of a rural district, hard by the roadside, about half-way between modern Cogan and Lavernock. Twenty years ago it was roofless, and stinging nettles flourished in the nave. The birds nested in holes in the wall, the eastern wall leaned outward a foot or so from the Perpendicular, and it appeared as though in a very short time there would not be one stone left upon another. But time works changes which are not all destructive, and to-day the little church is at all events secure. To the antiquary the church is especially interesting. Very small in size, not more than 50ft. in length, it dates back from Norman, if not still earlier, times. At the same time there are traces of Early English work in it. In the churchyard opposite the south porch is the

BASE STONE OF THE OLD CROSS,

all vestiges of the shaft and head have disappeared. The interior of the church presents many points of interest, not the least of which is the "herring bone" work in the walls, which bespeaks great age. The nave and the chancel are separated by a thick cross wall and low Norman arch. In the chancel are several graves of the Herbert family bearing date 1670—the family through which the present Marquis of Bute inherits part of his estates. These graves are now covered by a wooden floor, but by an ingenious arrangement the boards can be easily removed and the old tombstones laid bare. All round the wall to a height of a few feet oak wainscot covers the original stone plaster. At the west end of the church, close to the old font, is a curiously raised dais, now covered with a wood floor, upon which, it is supposed, the knights of the district formerly sat or knelt when performing their devotions. The ancient font is

A WONDERFUL OLD RELIC,

about which a curious story is told. Towards the end of the last century, when services at the church were discontinued, the parishioners of Sully were anxious to secure the font, and to this end asked leave to remove it. The leave was granted by the diocesan authorities, much to the chagrin and wrath of the farmers of Cogan, for at that time bad blood existed between them and the men of Sully. Determined that the font should not be removed, the farmers of Cogan went one dark night to the church armed with hammers, and broke the font in pieces. In this state it long remained, but afterwards such of the fragments as could be found were fitted together, though little more than the base and lower part of the basin now remain. The beautiful reredos which has recently been placed in the church, and which will be dedicated in the course of the next few weeks, has been erected by Lord Bute in memory of the late Mr. James Andrew Corbett, at whose suggestion the restoration work was commenced. The reredos, which is of bronze, is a work of great beauty. It is quite unique in character, and represents the Transfiguration. In the centre is our Lord, with a nimbus, in robes of gilt-bronze and aluminium. On either side are representations of Moses and Elias, and the figures below are St. Peter, St. James, and St. John. The lower part of the reredos is in the most chaste open bronze work in the Perpendicular style. Mr. C. B. Fowler was the architect for the restoration.

SHEFFIELD COUNTY COUNCIL has decided to accept the Duke of Norfolk's offer to sell to the corporation the whole of his markets and market rights in the city for £530,000.

A SYNDICATE is in course of formation to build and carry on a first-class theatre at Hampstead on a freehold site near Hampstead Heath Railway Station and the tramway terminus. The theatre is to hold about 2500 persons, and is to comprise a spacious pit and stalls, two tiers of boxes, and a large gallery.

ARTS AND CRAFTS IN THE CITY.

UNDER the auspices of the Worshipful Company of Turners, and by permission of the Lord Mayor, the exhibits in the twenty-ninth annual competition in turning in wood and metal were last week on view at the Mansion House. The number of exhibits were not large, but the quality of the work was above the usual average, and speaks well for the continued progress made under the influence of the Guild. The judges in the wood-turning classes, Mr. Burdett-Coutts, Mr. James Livesey, Mr. A. Murray, and Mr. G. W. Holtzapfel, considered that the quality of the work in general design and execution was up to the required high standard, and they were especially pleased with the improvement shown by the apprentices. The amateurs, both in wood and ivory, have come well to the front in support of the exhibition. The winner of the first prize for

WOOD-TURNING

was Mr. William Gleeson, of Cardiff, who sent four massive and handsome newels, three in teak and one in walnut, fit to adorn the stairs of some stately mansion. Mr. Gleeson received the silver medal and Freedom of the Company, and, subject to the consent of the Court of Aldermen, the Freedom of the City of London, and 5gs. Mr. R. H. Isaacs came next for the bronze medal and 4gs., with three sets of square pine balusters. Among the apprentices, Mr. L. G. Seegar, of London, stood first with two mahogany flower stands, and Mr. H. Wilson, of Coventry, second with nine deal balusters. There were five other prize winners, all of whom have produced highly meritorious work. The metal exhibits are very scanty, and hardly representative of turning in metal. Mr. A. W. Curzon, of Clerkenwell, was awarded the silver medal and the Freedom of the Turners and of the City of London with three escapements for marine and pocket chronometers. The other prize winners were Mr. F. Jackson, of Peckham, Mr. T. Taylor, of Sheffield, and Mr. W. Hayes, of Wimbledon. What is lacking at the Mansion House is

THE METAL WORKER'S ART

is, to a great extent, found at the Ironmongers' Hall, where another of the Guilds, the Founders' Company, has organised an exhibition of articles entered for competition by founders, designers, craftsmen, and apprentices engaged in foundry business within the metropolitan area. On the committee are Mr. W. E. Chambers, the Master, and Messrs. Herbert and Bertram, the Wardens of the Founders' Company, Professor Aitchison, R.A., Mr. Alfred Gilbert, R.A., and Mr. G. J. Frampton, A.R.A. Here, again, as at the Mansion House, the number of the exhibits is strangely small, but so far as it goes the display is satisfactory enough, and, in some of the specimens, of high quality, as, for instance, in Mr. O. Whiting's door knocker, a well-designed "Prometheus," and Mr. A. C. White's female head, which might have come from some French sculptor's studio. The ornamental and decorative work in metal is excellent in finish if not always original in design, and, small though this exhibition is, it is to be hoped that the Founders' Company will see their way to continue the encouragement which they have given, and which has been assisted by the Ironmongers in the lending of their beautiful hall to this important branch of art.

THE new county intermediate school of Machynlleth, Montgomeryshire, was opened last week. The building has been erected at a total cost of £2000.

THE exhibition buildings at Coolgardie are completed, and the Government railway siding has been constructed. Goods can therefore at any time be forwarded for the port of arrival and delivered in the exhibition grounds. Arrangements in reference to obtaining improved travelling facilities to Australasia for Great Britain and the Continent of Europe, and securing a British Art Section for the exhibition, are in progress.

EXCAVATIONS AT THEBES.*

BY JOHN E. NEWBERRY, A.R.I.B.A.

WHEN the Committee of the Architectural Association asked me to read a paper on "Excavations at Thebes," I accepted without much thought of the great range that such a generalised title might be taken to embrace; for the site of ancient Thebes is the place of all others in Egypt where digging for antiquities has been carried on from the earliest times. Professor Petrie remarks that what we now find are but the last leavings of a hundred generations of incessant pillage. But this paper will only deal with the excavations that

I personally assisted in making during two seasons' work for the Egypt Exploration Fund, and, by the kindness of the Committee of that Society, I am able to show you a series of lantern slides from photographs taken whilst we were unearthing the Temple of Hatshepsut, now known as Deir-el-Bahari, or the Convent of the North. The result of this excavation, to quote an article in the *Edinburgh Review*, "has been to give back to the world a temple which, though ruined in some parts, unfinished in others, is, perhaps, the most beautiful, certainly the most original in Egypt, and the earliest of those now standing

ON THE PLAIN OF THEBES."

I propose to divide my paper somewhat as follows:—First, a description of the site and surroundings of our work. Second, a brief sketch of the vicissitudes that this temple has passed through, which, to be intelligible, must include a recital of a few of the facts of ancient Egyptian history. Then I will endeavour to

describe our mode of work and the architecture of the building and its details. The site of the ancient city of Thebes in Upper Egypt is now marked by Arab villages, the principal being Luxor, Karnak, and Gournah, some 450 miles from Cairo by the river. When I returned from there in 1894, the railway alongside the Nile from Cairo only extended to Sohag, but now it passes through Luxor and Assuan, on the way to Khartoum. But no one should attempt a first visit by train if he can possibly afford the time and extra expense of going by steamboat, or better still by dahabiyeh. The *Edinburgh Review*, in the article which I have already quoted from, aptly remarks that "One cannot journey into

THE PAST OF SOME FOUR THOUSAND YEARS AGO

in thirteen hours of noise and dust. Five days on the Nile post-boat give a more fitting preparation, with their uninterrupted hours on a glassy water, through a landscape, monotonous

* A paper read before the Architectural Association at a meeting held on Friday, October 28th, 1898.

COMPETITION DRAWING FOR AN INFANTS' SCHOOL IN A NORTH COUNTRY VILLAGE. BACK ELEVATION. BY G. LL. MORRIS.

PLAN OF INFANTS' SCHOOL IN A NORTH COUNTRY VILLAGE. BY G. LL. MORRIS.

enough, but with a strange incomprehensible fascination of its own." To continue the quotation in the writer's own poetic words: "As one goes further south, the colouring becomes more vivid; the hills are no longer tinted with pale pink and purple, but glow at evening with the colour and transparency of a sunset cloud, or like snow peaks with their rose light and aerial blue shadows. At last, where the hills, no longer flat-topped, but with sharp peaks and jagged outline, open out round a fertile plain deep in corn, one comes to Luxor. It is sunset when one arrives by the post-boat; the sky glows behind the Libyan hills, the water towards the west is a sheet of gold and crimson, the pylons and obelisks of Karnak rise black on the left. Under the hills on the west bank one can faintly trace the white terraces and colonnades of Deir-el-Bahari; the Colossi are no more than two misty points against the hill; the giant pillars of Luxor stand out against the purple sky where night rushes up from the east; and Thebes is reached." A map of a part of the Theban district taken from Lepsius' "Denkmal" shows that on each side of the Nile stretches a belt of fertile land; it is much wider on the east side, extending for perhaps four miles from the river to the mountainous desert of the Arabian hills beyond. Here by the river are the remains of the mighty temples of Karnak and Luxor, created for the worship of Amon, and the work of many generations. On this side stood the ancient city of Thebes. It will be seen that the map shows the cultivated land on the west side to be only a narrow strip, which ends as abruptly at the foot of the barren limestone cliffs as a lawn adjoining the gravel walk in a garden.

EGYPTIAN TOMBS

were always placed in the desert, partly that they might be beyond the reach of the Nile, and partly because every inch of cultivated ground was, and is, so valuable. The hills here are regularly honeycombed with tombs, and this western side is simply one vast necropolis, the biggest in the world. The northernmost cliffs, known as the Drah abu'l Neggah, contain the earliest tombs. To the south-west is the entrance, a narrow gorge, to the natural amphitheatre of cliffs in which the temple of Deir-el-Bahari is situated. Beyond in the desert is the wonderful valley of the Tombs of the Kings, approached either by a ravine north of the Drah abu'l Neggah, or by a steep mountain path over the cliffs. On this side of the river are also the Ramesseum, the temples of Seti I., Medinet Habu, Der el Medineh, as well as the famous Colossi. Lepsius believes that the temple of Deir-el-Bahari was formerly connected with Karnak, since the axis of the prolonged dromos would lead straight to

THE GREAT TEMPLE OF AMON.

The remains of the Sphinx Avenue, from Karnak to Luxor, can be traced, and in places the ram-headed monsters are still to be seen. The ancient Egyptian name of the city is read as Uas, and its scriptural name was No, or No Amon, the city of Amon; no satisfactory explanation has been given as to why the Greeks called it Thebes, a name borne by cities in Boeotia, Attica, Thessaly, Cilicia, Asia Minor, etc. It will be convenient here to

briefly remind you that Egyptian history is divided into dynasties:—These are grouped into the *Ancient* kingdom, including the I. to VI. dynasties; the *Middle* kingdom, XII. to XVI., and the *New* empire, XVII. to XX., which is dated at 1600 B.C. to 950 B.C. Following this is the period of foreign domination, XXI. to XXV., or 950 B.C. to 663 B.C.—the late Egyptian period, XXVI. to XXX., or 663 B.C. to 332 B.C., and

THE GRÆCO-ROMAN TIME,

which includes the Ptolemies, the Romans and the Byzantines, from 332 B.C. to 640 A.D. The history of Thebes under the Early Empire is veiled in uncertainty, but it is known to have been the capital of a nome or province and was ruled by princes of its own. A Vith dynasty tomb has lately been discovered in the Drah abu'l Neggah by my brother, Mr. Percy Newberry, which I believe is the earliest known tomb in the neighbourhood. In the Middle kingdom, Thebes rose to a more commanding position, but its greatness dates only from the beginning of the New Empire, or, say, 1600 B.C. The liberation of the country from the Hyksos, and the reunion of the kingdoms of Upper and Lower Egypt was directed from Thebes,

and for centuries it continued to be the favourite seat of the Pharaohs. Historically, the interest of Thebes centres on one of the most fascinating periods of Egyptian history—the XVIIIth and XIXth dynasties, being the time of the Amenhoteps, Hatasu, or, more correctly, Hatshepsut, the Thothmes, Seti, the Rameses, and Merenptah, of Israelitish fame. But the sun of Thebes began to set when the Royal residence was transferred to Lower Egypt in the XXist dynasty. Alexander the Great and the Ptolemies probably found Thebes still a great, though decadent city, but they assisted to embellish it, as some buildings of this period attest. After many rebellions, the great city revolted for the last time in 30-29 B.C., taking part in the insurrection of Upper Egypt against the oppressive taxation of the Romans. Cornelius Gallus, the prefect, overthrew the rebels, and is said to have utterly destroyed the ancient town. From this time Thebes is only mentioned as

A GOAL FOR INQUISITIVE TRAVELLERS.

The introduction of Christianity and the edicts of Theodosius were followed by the destruction of many pagan statues, and the obliteration of countless inscriptions. Later the rock-cut tombs, at first occupied by Christian hermits, were converted into peasants' dwellings; Christian churches were erected in the temple halls, and mud-brick houses built between the columns of the Temple of Luxor. Carefully worked blocks and slabs were removed from the monuments, which were used as quarries, and much beautifully carved limestone has been burnt for making lime. In considering the history of

THE TEMPLE OF DEIR-EL-BAHARI

we must first glance at what we know of the reign of its great founder, Queen Hatasu, or Hatshepsut. In the first excavation of the temple it was not at once discovered that she was its founder, as in nearly all the inscriptions the name of her successor, Thothmes III., has been substituted for that of hers. But further observation has shown that, although she is always depicted on the reliefs in male

INFANTS' SCHOOL IN A NORTH COUNTRY VILLAGE. END ELEVATION. BY G. LL. MORRIS.

attire, the personal pronouns in the inscriptions are feminine, and the names of the king were incised deeper than the surrounding hieroglyphic signs. Such usurpation is not uncommon among the Egyptian kings, but the persistence with which every trace of the queen's reign has been erased seems to point to something more than the mere desire for fame. This destruction is attributed to the queen's nephew, Thothmes III., and the reason may be found in the

HISTORY OF THE SUCCESSION.

Professor Petrie in his "History of Egypt" says that the father of Hatshepsut, Thothmes I., died before he had a son old enough to succeed him on the throne; some five or six months before his death, and whilst he was probably in failing health, he associated his daughter with him, as she was the heiress in the female line, in which royal descent was specially traced. She was then about twenty-four years of age and of great capacity and power. Two or three months later the king married her to his eldest son, Thothmes II., who would otherwise have had no claim to the throne, being the son of Mutnefert, who was not a royal princess. Ten weeks later Thothmes I. died. His son, who was now king in name, was but seventeen years old, appears to have shown no abilities, and must have been a weakling, for he did not go on any campaigns, undertook no wars; in fact, did no great work of any kind, and at thirty he died. During his life his sister probably entirely organised public business, and at his death she was left sole legitimate ruler at about thirty-seven years of age, the only person who could challenge her power being her little nephew, Thothmes III., then, perhaps, nine years old. He had no claim to the throne, being the son of a woman named Isis or Aset, who was not of royal blood. But Professor Petrie considers that his aunt did all she reasonably could be expected to, for she associated him with her in the kingdom;

PUBLIC DATING OF DOCUMENTS

was carried on in his name; and she married him to her second daughter, Meryt-ra, as soon as might be, and thus gave him the position of heir. If she held on firmly to her royal prerogative, she only did what any other capable ruler would have done. No doubt it was galling to a very active and ambitious young man to be held down to peaceful pomp and routine. . . . But, to quote Professor Petrie again, all things come to him who waits. Egypt developed greatly during this twenty years of peace and progress, and at the Queen's death Thothmes III., now thirty-one years old, succeeded to the full power. He was then able to launch into that mighty series of campaigns which mark the highest extent of Egyptian power, and which gloriously occupied twenty-eight years of overflowing energy. We can now form some idea of the force of character and ability of Queen Hatshepsut by the fact that she is, as far as we know, the only woman in the great historical period that overcame the prejudices of a changeless people and broke the male line of succession. By one means or another she kept her throne, and only after many years could her mighty nephew

WREAK HIS VENGEANCE ON HER MONUMENTS.

But Hatshepsut's temple suffered at other hands than Thothmes III. Amenophis IV., Khuenaten, or, as the name is now read, Akhenaten, the so-called heretic king, hacked out here, as everywhere, the figures and names of Amoh-Ra, and the inscriptions and reliefs were left thus mutilated until the time of Rameses II., who restored them, though in a style unworthy of the first hand. For centuries after the temple remained practically unaltered, though there are evidences that the unfinished northern colonnade was used by a colony of embalmers as early as the XXII. dynasty, and many burials have been discovered in this part of the XXVI. dynasty. Under Ptolemy Euergetes II. a few minor restorations and some important additions were made. On the introduction of Christianity a community of monks established themselves,

and founded a Coptic convent, known to the Arabs as Deir-el-Bahari, which was built with bricks brought from an edifice of the XXVI. dynasty at the Assasif. The

CHAMBERS OF THE TEMPLE

were converted into chapels, and the "heathen" representations on the walls barbarously defaced. The earliest detailed description of the place is given in the account of the French expedition of 1798, and later on we read of it in the works of Wilkinson, Lepsius, and Mariette, the latter of whom undertook important excavations in 1858, and published a monograph on the temple. But it was reserved for the Egypt Exploration Fund, under the able guidance of M. Naville, to bring to light one of the most interesting temples of Egypt, of which up to 1892 two-thirds were covered by mounds of rubbish that reached to a height of 40ft. in places. As I am addressing an architectural audience I cannot do better than begin my description of the temple with a ground plan. This only reaches as far east as the lower colonnade, the excavation of the lower part not having been commenced when the drawing was prepared. The plan is very remarkable, quite different from all

OTHER TEMPLES IN EGYPT,

and was probably suggested in great measure by the site. It consists of three great terraces or platforms cut out of the east slope of the mountain, and rising one above the other from the level ground, the upper platform being backed against the vertical cliffs, which here rise to a height of 384ft. Centrally placed sloping ways, or inclines, lead from terrace to terrace, and along the front of each terrace the ceiling stones of the one above were carried over on the top of a double colonnade, thus forming a kind of cloister underneath. The upper and part of the middle platforms are terminated by a series of chambers, excavated and then built into the solid rock. The sphinx avenue, some 24ft. wide, with trees planted at intervals, led from the plain, or perhaps the river, to the gateway of the lower court, or entrance to the temple precincts, and formed a continuation of the axis of the temple, running approximately east and west. Only the scantiest traces remain, but these are enough to show that the gateway was flanked with

GREAT GRANITE OBELISKS,

which stood on pedestals. This first court, or lower platform, measures about 325ft. by 263ft. wide; and the excavations have proved that it was treated as the garden or orchard of the temple; round pits cut in the rock some 10ft. deep have been discovered full of Nile mud, with the stumps of palm or apricot trees still in them. The western colonnades are in ruins, but we can see that they each consisted of twenty-two pillars, arranged in double rows. The back row was sixteen-sided and the front row seven-sided at the back and square in front. The top of the stone ceiling of this colonnade formed the floor of the court above, the middle platform, which is at a level of 21ft. higher up. It measures roughly 279ft., by 250ft. wide. On the west it is bounded by a double colonnade, each side consisting of eleven pairs of square pillars. Two steps at the north end of the colonnade descend to a hypostyle hall, in which are twelve sixteen-sided columns arranged in three rows, which support massive architraves and a flat stone ceiling. Three steps lead up to

THE SHRINE OF ANUBIS,

consisting of three small chambers, with elliptical vaulted ceilings. On the north side of the court is a colonnade of fifteen sixteen-sided columns, and in the wall behind are four small vaulted chambers. The south side of this middle platform is supported by a retaining wall ornamented with wide, flat pilasters, surmounted by alternating hawks and urasi of colossal size. To the south-west of this court, and at the same level, is the little shrine dedicated to Hathor, goddess of the dead. It has since been found that this was reached only from below, by a flight of steps, of which a few traces still remain. The innermost chambers are hewn out of the rock, and are preceded by two covered vestibules, which are now in ruins. The first had sixteen-sided

columns and four square pillars, with semi-circular attached shafts, terminating in Hathor-headed capitals, the remains of which are now lying shattered on the ground. The second vestibule, at a slightly higher level, has four central columns with round shafts and sixteen-sided columns on either side. The shrine proper is raised two steps, and consists of three chambers, each with several niches surrounding it. Here we find conformity with the same law which prevails in hypæthral temples, and which M. Perrot has named

"THE LAW OF DECREASING DIMENSIONS."

Thus from portico to sanctuary the dimensions of the building decrease in every way, and the floor itself rises. The innermost room contained the sacred emblem of the goddess, perhaps a golden cow, enclosed in a tabernacle or shrine. The sacred boat, which bore the tabernacle, was probably kept in the room immediately preceding. The various lateral niches were used, it is supposed, as store chambers, to serve for offerings, the divine vestments and all the sacred furniture. We now ascend to the level of the upper platform, which is again 21ft. higher up. The terrace in front of the central court had a row each of square pillars and sixteen-sided columns, as remains show, on the north side. A granite doorway leads to this central court, 83ft. by 121ft. wide, which it is now considered had a double row of columns around it.

(To be continued.)

OUR ILLUSTRATIONS.

AN INFANTS' SCHOOL IN A NORTH COUNTRY VILLAGE.

THE School, of which we give a perspective view, and the elevations, was to have been built in a stone district, and it was proposed by the author to use very large stones at the angles (somewhat similar to the quoins of a Lancashire Manorial Hall), the principal part of the walling being of smooth parpoints, varying from 1½ in. to 3 in. thick. A touch of red colour was obtained by the introduction of three bands of tiles, several courses deep in the gables. The School, which was designed by Mr. G. Ll. Morris, was to accommodate 174 infants.

WOODFORD COTTAGE HOSPITAL.

THIS building is now being erected facing the green at Woodford, and is the gift of Mr. J. R. Roberts, J.P., as a Jubilee memorial to the poor of the district. The building on the ground floor consists of two wards, one for male and the other for female patients, 26ft. by 20ft. each, with accommodation for six patients per ward; these are divided by the nurses' sitting room. From each ward a corridor leads to a bath pavilion, which contains bath, w.c., and sink room, all disconnected from the ward itself. Across the hall is the operating room, 20ft. by 13ft., with a large bay. This room is constructed, internally, so as to give as little possible harbourage for septic deposit. At the rear are the matron's sitting and bed rooms. The kitchen and offices, together with ironing room, &c., are on the return frontage to Grange Avenue. On the first floor two paying patients' wards are arranged for, to accommodate one patient each, with bath pavilion at end. On this floor are the nurses and servants' bed rooms, box rooms, and stores. The basement contains the laundry, ambulance room, heating chamber, and the necessary minor offices. The building is faced externally with red brick and patent Victoria stone, with half-timber work introduced in the gables. The fireproof work throughout is in the hands of Messrs. B. Ward and Co., of Westminster. The roofs are tiled with buff Brosely tiles. The general contract for the building amounts to £5000, and is carried out by Messrs. Thos. Osborne and Sons, of James Street, E.C. The architects are Messrs. J. Kingwell Cole and Kenneth Wood, A.R.I.B.A.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
November 2nd, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slabs; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

ONE of the finest old churches in Central France fell in on Sunday night week, and is now a complete ruin. It is the parish church of Montluel, in the Rhône Department, and was built in the purest style of the thirteenth century. Fortunately the accident, which is attributed to the recent heavy rains, happened just after evening service, otherwise a terrible disaster would have been certain.

THE excavations at Pompeii during the past year have resulted in the discovery of an unfinished temple, near the "sea gate," which appears to have been deserted by the workmen at the very moment of the catastrophe. Tools, carvings, masonry, have been left just as they were, the light thrown upon the methods of the Roman stone artist being very valuable. Hard by the ruined city, in a plot of private ground, has been found one of the finest and most interesting mosaics of antiquity. It consists of a group of seven philosophers, one of whom is reading from a scroll, and contains in the background a view of the Athenian Areopagus. The mosaic, which was apparently new and had never been put down, has been acquired by the Government, and will shortly appear in the Naples Museum.

ANTIQUITY has hid for ever the name of the first turner, and the Company, or Guild, in the City of London which deals with and perpetuates his invention has, therefore, been compelled to fall back on a mythical personage, and ascribe its foundation to the celebrated Richard Whittington, who, in "turning" at Highgate, in response to the admonition of the bells of Bow, became the legitimate patron of a useful and ornamental craft. At all events, from that time the Company has never turned aside from the right path in encouraging this beautiful art, and the exhibition of work, which was held at the Mansion House last week, was highly creditable to its fostering care in promoting high-class and artistic technique.

THE several correspondents who have recently written to the Times on the subject of "Building Regulations in Town and Country," are unanimous on one point—that the building by-laws cause unnecessary expense and inconvenience in rural districts. "So great is this expense and inconvenience," writes W. M. A., "that it results in most rural districts refusing to adopt any building by-laws at all, with consequences, sanitary and other, which are often to be regretted. The moral would seem to be that greater elasticity must be introduced into the machinery. In the first place there should

be, I submit, a larger number of 'models.' The code in force in the Devonshire village from which I write, deals, to give one instance, with the thickness of the walls of domestic buildings between 90ft. and 100ft. in height, and yet there is really no great likelihood of Hankey's mansions being copied in this neighbourhood. Further, I submit that various by-laws as to 'space about buildings,' 'ashpits,' 'materials,' and so forth, might with advantage be 'starred' as applicable only to the village proper and not to detached residences two or three miles off down a lane.

"BUT even if this were done we should still want a dispensing power somewhere, and I have recently been officially informed that the Local Government Board would not be prepared—and rightly, I can well believe—to leave a dispensing power in the hands of the local authority. But surely no risk could be run if the Local Government Board reserved to itself the right to dispense with what are really, though not in name, its own by-laws on a memorial addressed to it by the person proposing to build, and submitted to the local authority for their observations. In difficult cases the would-be builder might even be allowed to claim that the Department should send down—of course at his expense—one of its own inspectors to view the *locus in quo*. I submit that the matter is one well deserving reconsideration by the Local Government Board."

MR. EDWIN O. SACHS' work entitled "Modern Opera Houses and Theatres" will see its completion towards the middle of November, when Messrs. Batsford, the publishers, will issue the third volume, which includes a treatise on Theatre Planning, with various supplements. This volume, as the others, will be grand folio size, and will comprise over 300 pages, with some 900 illustrations on plates and in the text. A feature of the third volume will be the particulars given in the introduction regarding the finance, staffing and management of the subsidised or endowed theatres of the Continent, which should be of some value at the moment when the proposal for a Municipal theatre for London is under consideration. The main chapter of Mr. Sachs' treatise is devoted to the general arrangement of the playhouse, and the chapter next in importance deals with the auditorium. Among other chapters there is one dealing with safety of life, and another with the service arrangements. The three supplements treat respectively of stage mechanism, theatre fires, and protective legislation. With the completion of the work every class of playhouse in Europe will be referred to, from Madame Patti's miniature auditorium at Craig-y-nos, or the Casino Theatre at Monte Carlo by Charles Garnier, to the most important opera houses of Paris and Vienna, or the distant establishments in the Russian Caucasus. The international character of the work is characterised by all the references on the plates being in three languages. Volume 1 was issued in 1896, and volume 2 last year, whilst the preparations for the work reach as far back as 1890.

MR. E. BOROUGH JOHNSON has just been appointed head-master of the Art section of the South Western Polytechnic at Chelsea. He is, like Mr. Burns whom he succeeds in the post, an old pupil of Professor Herkomer's, and the artistic system which he follows in his own work, and upon which his teaching is based, is that which has already produced such good results at Bushey. He has had considerable experience as an Art educator, and should give a very good account of himself in the wide sphere of influence open to him at Chelsea. His capacity as an artist is unquestionable, and many of the pictures he has exhibited have been worthy of the highest praise.

EDINBURGH claims to have discovered an interesting, if grim, link with the historic past. An antiquary of that city has brought to light the stones which formed the central portion of the old Netherbow Fort, and it is

stated that it was upon one of these that the head of the famous Marquess of Montrose was placed after his execution. The portion of the Netherbow Fort, of which the stones formed a part, was supposed to have been erected for the Provost and Bailies in 1606 by John Mylne, who, according to the city treasurer's accounts, was at that time Master Mason to the King of Scotland.

THOSE who have charge of the Lincolnshire memorial to Tennyson have, says the Globe, set about their task with commendable care. Great pains have been taken to secure a suitable place for the poet's statue at Lincoln, and after many visits and inquiries, two spots have been selected, either of which would be suitable. The monument, the committee think, would stand well in front of the ivy-covered church of St. Benedict, and the opinion is also held that it would have an imposing appearance on a space between the road fronting the south entrance to the Cathedral and the Vicar's Court. A decision as to the exact spot for the statue will be come to at the next general meeting.

FORMERLY there hung in the refectory of the Abbey of St. Michael of Le Treport an ancient and vigorous oil painting commemorating the foundation of the Abbey in 1056. In 1790 this painting was seized by the delegates of the Directoire, who carried it off to Rouen, where it disappeared, and was not afterwards heard of until the other day, when it was found among the stock of a picture dealer in Paris. The good news was at once conveyed to the authorities of Le Treport, and they have entered into negotiations for the purchase of the painting.

CAMBERWELL, Brixton, Stockwell, Clapham, Wandsworth, once all separate suburbs, are now merged in a single monotony of streets and houses. The democracy—small clerks and workpeople—are pushing further south. Dwellers in Clapham know how the old and stately mansions in their spacious gardens, recalling memories of Macaulay and Wilberforce, are giving way before the interminable rows of doors and bay windows. Sir Walter asks the dweller in Penge if he has ever heard of Penge Common—and the resident in Norwood if he knows aught of the Norwood oak, or the Norwood Spa, or the Norwood gipsies. Who thinks of Mrs. Thrale at the south-east corner of Tooting Corner, or of Defoe at Tooting itself, or of Voltaire at Wandsworth, or Pitt at Putney? Verily, the builder and the railway engine have played havoc with South London.

THE directors of the Colston Hall (Bristol) Company held a meeting last week for the purpose of considering what should be done in reference to the future of that building. While ready to restore the hall on an improved plan, they considered that the citizens should possess a public hall, and therefore they made overtures to the Council, and were prepared to let the city have the site on fair and easy terms. But the Council not having accepted that offer, the directors have decided that in the interests of the citizens steps should be immediately taken to rebuild on the site. At the meeting plans, which had been prepared for the guidance of competing architects, were submitted, and the directors are already inviting architects to send in plans and designs for the restoration and refitting of the hall. The directors will appoint an assessor to assist them in making selections from the plans, and meanwhile a sub-committee of the directors will visit some of the best public halls in the kingdom with the view of being well instructed so as to help them in giving to Bristol a hall second to none both as regards convenience and means of ingress and egress.

THE London, Brighton, and South Coast Railway have, in consequence of the great increase of traffic on their system, decided upon important extensions at Victoria Station. For some time past the London Brighton directors have felt the necessity for increased accommodation, and it has now been decided to

extend the terminus of their line to the westward of the existing premises. This will involve the taking up of land situated behind the south side of the Buckingham Palace Road, where what will be practically a new terminus, to be devoted exclusively to main line business, will be erected. Foot passengers by that line will enter by the present doors into the booking hall which is to be much enlarged and improved, while a special entrance and exit for vehicles will be constructed by the side of the Grosvenor Hotel. There is no intention whatever to interfere in any way with the existing London, Chatham, and Dover station, as has been stated in several of our contemporaries.

SIR WALTER BESANT, lecturing at the new Congregational Tabernacle, Shoreditch, on the subject of "Around the Tower of London," characterised the new Tower Bridge as the most noble entrance gate and portal that existed in the world. He referred to the antiquarian history of Thames Street and the neighbourhood, and remarked that on looking at a picture of Pompeii they would see how closely the streets of that district, even to this day, resembled the old Roman streets, having from time immemorial been the home and haunts of those connected with the service trade of the City.

MR. CECIL L. BURNS, of the London Art Gallery (Lord Leighton Memorial), Peckham Road, S.E., writes:—"I am organising a special exhibition of drawings and prints showing the rise and development of popular illustration from the time of Dürer and the early Italian draughtsmen upon wood to the present day. Apart from the artistic interest attaching to the drawings, it will, I think, prove of educational value to students, and of great interest to artists to trace the influence exercised by the method of reproduction upon the style of the draughtsmen at various periods—from the ancient drawings done on the wood planks, through the copper engravings which supplanted them, and again through the boxwood engraving popularised by Bewick, to the modern photo-mechanical process block. Owing to the fact that the South Kensington Museum can only lend their large exhibition for the short space of two months, I am anxious that students and the public should know of the opportunity afforded them, thanks to the generosity of many well-known collectors, who have placed drawings which may never again be at my disposal. I should, therefore, esteem it a great favour if you could give publicity to the exhibition through the medium of your columns. The exhibition opens on Monday, November 7, and will continue open till early in January. It is open free to the public from 2 p.m. to 10 p.m."

A SCHEME is on foot for the further restoration of St. David's Cathedral, described by the late Bishop Thirlwall as "the noblest monument of ecclesiastical Architecture in Wales. It is recognised that in this venerable pile, Wales possesses an architectural monument almost unique in this country—a treasure of mediæval Architecture, to which there are very few parallel in the kingdom. Dean Howell, who seeks to raise a fund of £12,000, points out how great has been the work accomplished during the last thirty-five years in the way of restoring the cathedral of the mother diocese of Wales to its former magnificence. Nearly £44,000 has already been spent in this way. What is now proposed is to effect a thorough restoration of the eastern group of buildings, "which form a very important and especially beautiful part of the cathedral, but are in a state which can only be described as little better than ruinous." The group consists of Bishop Vaughan's noble chapel, of the vestibule of the lady chapel, and, still further east, of the lady chapel itself, which is the largest and most important of the group, and finally of the later continuation of the north and south aisles of the early English Presbytery. In addition to the restoration of the eastern chapels, it is also proposed to remove the existing buttresses on the north side of the nave, built apparently in the darkest period of architectural debasement,

and at present a serious disfigurement to the cathedral, and to replace them by others more in character with the rest of the sacred building; and particularly to do what is needful to arrest the decay of what remains of St. Mary's College, founded in 1365, so as to preserve one of the oldest and most interesting ruins of the kind now existing from further dilapidations.

MR. WALTER CRANE writes to the Times as follows:—"As a member of the Society for the Protection of Ancient Buildings, I am surprised to see that no answer has been made to a letter of that Society which appeared in your columns of Oct. 17, calling attention to the state of Chichester Cathedral, certain cracks having appeared over the large western doorway in the west wall of that building. These cracks have appeared, as I understand, as the result of the new north-west tower, and consequent destruction of old work, against the advice of the Society for the Protection of Ancient Buildings, who in fact foresaw the danger and pointed it out to the Dean and Chapter and restoration committee as long ago as last November. As we are without any national authority for conserving our historical buildings, this important but thankless task falls upon the Society, an expert committee of which devotes its time to what is really public service. It is not, then, too much to ask that their efforts should be supported by the public.

At the last meeting of the London County Council the General Purposes Committee reported that Mr. Blashill, the superintending architect, would retire at the end of this year. The retiring age for officers had been fixed by the Council at sixty-five years, but Mr. Blashill had at the request of the Council remained another three years in their service. His full length of service was eleven years. In recognition of his valuable services to the Council, the committee recommended that he be allowed a pension of £525 a year, being at the rate of twenty-one sixtieths of his salary of £1,500 a year, ten years being added to his eleven years of actual service, as authorised by the Act. Mr. Dew moved an amendment to refer the report back for the committee to give a pension of the amount to which Mr. Blashill was entitled by his actual period of service. Mr. Hubbard, in supporting the amendment, said that had Mr. Blashill been called upon to retire when he was sixty-five, he would not have been entitled to a pension, but he had been allowed to stay on in order to qualify for one. In the discussion which followed, several members spoke in the highest terms of Mr. Blashill's service to the Council. The amendment was rejected by a large majority, and the committee's recommendation was adopted.

LAST week, at the monthly meeting of the Gower Archaeological Society, at their rooms in Gower Street, Mr. Alwyne Fitzdavis, D.D., exhibited a torque of fine gold discovered a few days ago in a wood forming a part of Charnwood Forest. A new fox-earth had been made just at the place, and the animals appear to have been amusing themselves with the torque, which, there is every reason to believe, they had raked up in their gambols. It was found in its present state by the keeper at the mouth of the hole. Many collars of this description, formed of a single wreath, have been exhibited on previous occasions at the Society's rooms, but in form and character of workmanship this one is more curious and more splendid than any yet discovered, and it is chiefly remarkable in the number of wreaths which compose it. Its weight exceeds one pound, and it is, therefore, of considerable intrinsic value, apart from that it possesses as an antique. Mr. Fitzdavis intends to present it to a public institution, probably to the British Museum.

THE executive committee of the Gladstone Liberal Memorial Fund have resolved to entrust the execution of the statue of Mr. Gladstone, which is to be placed in the Houses of Parliament, to Mr. F. W. Pomeroy. He is

best known by his Burns Commemoration Statue, which Lord Rosebery unveiled at Paisley. Mr. Linley Sambourne will design the commemorative certificate for subscribers.

THE Modern Gallery, 175, Bond Street, is the headquarters of the latest additions to Art exhibitions—that of the London Sketch Club. The inaugural show is now open to the public. Mr. G. C. Haité, who is president of so many societies, is president also of this, and seeing how active he has always been at the Langham Club, and that a large proportion of the present exhibits are marked as being Langham "time" sketches, we may wonder whether there is connection—or the reverse—between the old and the new sketching clubs. Be that as it may, the clubbists now to be considered are quite a gallant band, embracing artists of all sorts of pictorial opinions. These comprise dainty pen drawings by Mr. Shepperson, mental impressions—mainly of figure—dashed off in opulent oil colours by Mr. Dudley Hardy, or landscape full of sentiment and very sympathetic as to atmosphere and light as in "A Wet Harvest," by Mr. H. Sykes, and the extensive swampy land bounded by wind-cramped thorn trees, "The Haunt of the Gull," by Mr. Lee Hankey. Self-expression always rules in sketches, though indeed quarrel may be made that half the things present are not sketches at all, but of quite finished work. Such are the illustrations of nursery rhymes by Mr. Cecil Aldin, character drawings by Mr. Phil May, graceful beaux and belles of last century painted fluidly, in delicate tones of water-colours by Mr. Robert Sauber, and many another. Probably when the club is more firmly established, and time does not press, the exhibits will be confined to that order suggested by the club's title. Some of those who by quality of their works as a whole most strengthen the exhibition are Mr. Haité, Mr. Tom Brown, Mr. Walter Fowler, Mr. Lee Hankey, and Mr. Lance Thackeray.

MR. EDWARD ROBERTS, of Swansea, has just produced a most interesting history of St. Iltyd's Church, Pembrey, which is published in book form, and is copiously illustrated by Mr. H. A. Pertwee, of Burry Port. St. Iltyd's is, unquestionably, one of the oldest churches in Wales, and although, as Mr. Roberts says, there is nothing in the tower or aisle to show definitely any trace of work prior to the twelfth century, the nave and chancel appear to have been the older building. The church is noteworthy for heraldic carvings on its southern window, including the arms of the Butlers of Dunraven, the Bassets of Beupie, and the Beauforts and Plantagenets, etc. There is a carving also representing the pierced feet, heart, and hands of the Saviour; also the nails, the only similar thing known in Wales being carved on an old oak chest in Coity Church, near Bridgend.

THE proposals introduced last summer by the London-United Tramways Company for the adoption of electric traction have been accepted, in part, by the County Council. That body has agreed to electric cars on the underground conduit system being run along the Uxbridge Road and Goldhawk Road lines, and also on that part of the company's route extending from Hammersmith Broadway to Young's Corner. Beyond this point the jurisdiction of the London County Council does not extend. A correspondent suggests that a covered waiting-room should be provided at the several recognised stopping places on the tramway line, just in the same fashion adopted on the Bristol tramways, not only for the comfort of the passengers, but with a due regard for the convenience of pedestrians. Indeed, it is little short of scandalous that the omnibus companies have not yet been compelled to provide waiting-rooms for their passengers at such crowded points as the Marble Arch, Chancery Lane, Broad Street, Ludgate Circus, or Charing Cross, where, at any time of the day, and far on into night, crowds of people obstruct the pavements and hinder the circulation of traffic along them in the intervals between the arrivals of omnibuses.

Professional Items.

ABERDEEN.—The favour which has been shown by southern architects of late years for ornamental granite fronts for business premises continues to develop, and this line of work is proving an important source of business for Aberdeen granite monumental manufacturers. The fashion has come at a most opportune time, when the export trade in finished monuments for America has been showing such a falling-off. In many ways the house-front trade is preferable to the American monumental trade, but especially in respect that each contract means a large amount of work, and, also, that there is much more satisfaction in the work as regards price arrangements. At the present time most of the large granite firms in the city are engaged on orders of this description. Probably the most important contract of the kind that has been carried out in Aberdeen has just been secured by Mr. Charles M'Donald, Froghall Granite Works. It is a front of three sides, two stories high, for a business block in the busy city of Belfast. The total length of the front is 150ft. by 33ft. high from the ground level, and as it consists largely of massive moulded piers, and horizontal courses of a similarly rich design, the whole being finely polished, it will be seen to represent a very large amount of work. The central doorway, 30ft. high by 20ft. wide, is of elaborate design, and the enormous jambs and semi-circular top would of themselves have been a considerable contract. Part of the job consists of six columns, each 2½ft. in diameter at the base, and 19ft. high, which will decorate the front of the second story of the building. About 500 tons of granite will be used in the job. The contract price amounts to close on £6000.

ACOMB (Yorks).—A new pulpit and window, which have been placed in the parish church of Acomb, near York, were dedicated last week. The pulpit forms a handsome addition to the internal fittings of the sacred edifice. The body is of alabaster, relieved with small dark marble pillars, and stands upon a substantial stone pedestal. The handrail, lectern, and gas brackets are of brass, the latter being relics of the former pulpit. Messrs. Erps and Hobbs, of London and Manchester, have executed the work. The window, of stained glass, occupies a position in the north aisle. It is lancet shaped, and the subject portrayed is the Ascension. This work has been executed by Messrs. Lavers and Co., of London.

BELFAST.—The first Ballymacarrett Presbyterian Church was opened last week. The Gothic style of the fifteenth century has been employed throughout the building. The heating is on the "Plenum" system, by Messrs. Musgrave and Co., and the lighting is by Mr. John Dowling. Mr. Robert Corry is the contractor for the work, and Messrs. Young and Mackenzie are the architects.

BIRMINGHAM.—Perhaps no portion of Birmingham is at the present time undergoing so rapid a transition as the Colmore Estate, between Colmore Row and St. Paul's Square. Old properties are being pulled down, streets are being widened and diverted, and a large number of modern and handsome buildings are rapidly springing up and taking the place of so many old rookeries. One of the most important buildings of the series is a large block of offices in Newhall Street, and also having a frontage to Cornhill Street (originally Bread Street). In this case, advantage has been taken in the difference of the levels to obtain several entrances, and so avoid anything in the nature of a warren. The building has been planned with suites of rooms for doctors or dentists, having separate entrances, and at the back and on the upper floors are a large number of professional offices. In the aggregate the number of the rooms is about ninety. The elevations, in small red bricks

and buff terra-cotta, and a very fine roof of Stow-in-the-Wold stone slabs (the first used in Birmingham), are a picturesque rendering of the later Dutch style. In Edmund Street, a large block of offices for Messrs. G. J. Eveson, Limited, in a floral treatment of red bricks and buff terra-cotta, has just been completed. Almost immediately opposite, new premises have just been started for Messrs. Edmund Worrall and Co., bookbinders. These premises contain shop, warehouses, and offices fronting the street, and will be carried out in Darley Dale stone, Leicester sand bricks, and Westmoreland slate roofs. Immediately adjoining will be two sets of doctors' chambers with residential houses, for which there is a very large demand in this district. They are so planned that they may be used, if necessary, as private hospitals. The elevations show four bold arches on the ground floor in Portland stone, from which rise an equal number of ornamental bay windows, terminating in two high-pitched gables and a bold green slate roof. Perhaps a broader treatment than any of these obtains in the new buildings for Messrs. Buckler and Webb, Limited, at the corner of Church Street and Cornwall Street. The elevation to Church Street is divided into five large spaces, with semi-circular arches, springing from wide and deeply-recessed piers. Above this is a boldly-modelled cornice and window in arcading for the top floor. This treatment is also in small red bricks and buff terra-cotta, and when completed the deep shadows from the recessed piers should give a very bold effect to the whole. The architects are Messrs. T. W. F. Newton and Cheate, of Colmore Row.

BUCKLAND.—A new church is in course of construction in Kingston Road, Buckland, from plans prepared by Mr. Crowley, of Croydon. Mr. T. P. Hall is the contractor. The church, square in shape, owing to the shallowness of the site, is to be of red brick, with corn-grit stone dressings, of which material the pillars and arches will be formed. The style of Architecture is the Perpendicular. The cost of the building (exclusive of the site, valued at £1000), is estimated at £7300.

DEVONPORT.—A new Baptist chapel has been erected at Ford, Devonport. The plans were prepared by Messrs. Wiblin and De Boinville, of Plymouth, and the contractor is Mr. W. Partridge, also of Plymouth, whose contract was £2552 5s. The building is designed in late perpendicular style, and will have a most attractive and picturesque frontage on Alfred Road. It will be built of red brick, relieved by polyphant and Doulton stone dressings. The main front will have gable, with a handsome five-light tracery window, and will be flanked on either side, with turrets. There will be two main large entrance doorways opening into a lobby, and a doorway to each turret, which will form the future gallery entrances. The seating accommodation on the ground floor will be for 480. If galleries are added there will be an additional accommodation for 235 more. Two vestries are provided, together with an organ chamber and choir seats. Heating is to be supplied by means of hot water pipes. The roof is to be open timbered.

DUBLIN.—For a considerable time extensive building alterations have been in progress at No. 16, Dawson Street. The old building has been remodelled. The front of the house has been taken down and rebuilt with Portmar-nock bricks, having pilasters, cornices, string and caps of terra-cotta. The building works were executed by Mr. P. Ryan, of Church Street; the plumbing work by Mr. Farquarson, of Jones's Road; the mahogany-work and shop front by Messrs. Dockrell, of George's Street; the painting and decoration by Mr. Keatinge, of Grafton Street; and the electric fittings by Mr. Robinson, of College Green. The entire works were executed according to the designs, and under the supervision of Mr. J. L. O'Hanlon, C.E., Dublin.

DUNDEE.—Mr. William Mackison, the Burgh Engineer of Dundee, has prepared sketch plans

and front elevation of a new Central Fire Brigade Station. The site is well adapted for such a dépôt. The area to be covered is 30 poles. The engine-room, in the front, will be entered by four wide doors, with arched heads, transoms, and glazed fanlights. Over each of the two extreme doors circular oriel windows, carried up to the top of the three stories, will be formed; while the corner of the block will also have a circular oriel window, and will be surmounted by a tower. The accommodation on the ground floor will consist of an engine-room, with stables immediately in the rear fitted with six stalls and a loose box, having a harness-room adjoining. On the north side of the engine-room will be situated the duty-room, in which will be fitted up telephones and other means of communication. Alongside is the reading-room. On the other side of the passage leading to this there will be a lobby running direct to the staircase, to the dwelling-houses, to the hose tower, &c. Off the washing space there is a boiler-house and a large recess for firemen's uniforms, &c. There will be a two-story back building, with access off the court, containing workshop and a washing-house for two families. In addition to other rooms, a gymnasium will be fitted up. The cost is estimated at £6100, exclusive of the purchase price of the site. The plans have not been finally adopted.

HEREFORD.—A new foot bridge has been built over the Wye at Hereford. The bridge has two main piers consisting of cement concrete upon which ornamental steel towers are erected. These carry steel suspension chains, which pass through the shore abutments to the anchor blocks, which, the same as the abutments and piers, are also of concrete. The central opening is 110ft. span with the two side spans of 37ft. 6in. each, and the suspension chains consist of four rows of steel links (two on each side), each 3½in. by 11-16th of an inch. The foundations, concrete piers, and masonry throughout have been carried out by local labour, almost entirely of an unskilled character. The contract for the steel and iron-work was let to Messrs. Findlay and Co., Motherwell, who have carried out their work in a most satisfactory and creditable way. The work of decorating and painting was entrusted to Mr. J. C. M. Vaughan, of Hereford. Mr. W. H. Beswick, A.M.I.C.E., acted as resident engineer for the foundations, the work throughout having been carried out from the designs and under the personal superintendence of Mr. John Parker, C.E., City Engineer, Hereford.

LONDON, N.—A new Board school at Ambler Road, Blackstock Road, Finsbury Park, was opened last week. The new buildings will accommodate 930 children—300 girls, 300 boys, and 330 infants; and the total cost of the building and site has been £26,000.

MIDDLESBROUGH.—The dedication ceremony recently took place of the New Holy Cross Mission Church, Middlesbrough. The old building, which was formerly a music hall, has been adapted to the purposes of a church and mission hall. The structural alterations necessary have cost a sum of £1000 and the furniture about £150. All the work contemplated in the interior of the edifice has not, however, been accomplished at the present time, but this will be attended to at a later period. From Lord Street the entrance gives admission to the ground floor hall, which is about 43ft. by 40ft., provided with a platform 36ft. by 17ft. From the same street there are two separate entrance staircases, which give admission to the church on the first floor, which is estimated will seat nearly 500 people. A chancel is erected at the east end, with dome lighting from the top. A separate entrance has been provided from Benjamin Street for the admission to the clergy and choir vestries. To secure sufficient strength to support the portion of the building to be used for church service three heavy girders have been placed as cross supports. These measure 39ft. in length, are 22½in. in height, and weigh nearly 3½ tons each. They rest on a column of bricks and cement, built

from the ground, and the whole will bear a weight of 120 tons, or 40 tons each. Mr. Roberts, of Middlesbrough, was the architect, under whose supervision the work was carried out by the contractors, Messrs. Allison.

NEWCASTLE.—The foundation stones of the "Bond Memorial" Wesleyan chapel at New Benwell, Newcastle, have just been laid. The chapel is to be erected on the site of the Iron Chapel, between the School and the Manse, in Adelaide Terrace. It is designed to accommodate 800 persons in seating arranged on the ground floor and in two galleries. There is a gallery behind the rostrum for the choir, with organ gallery adjoining, and there are three vestries. The walls will be of rubble stone, and the doors, windows, and angles will have stone dressings. The roof is to be covered with slates, the internal woodwork is to be of pitch pine, and the building will be heated by hot water radiators. There is a large three-light window behind the rostrum, which is to be fitted with stained glass. The contract is let to Mr. Thomas Hutchinson, of Elswick Road, and the architect is Mr. John W. Dyson, Grey Street, Newcastle-on-Tyne.

NEWARK.—A new school of Science and Art is being erected at Newark, which is to constitute the town's Diamond Jubilee Memorial. The building will cost about £3200, and is being erected by Mr. W. Smith, builder, Newark, from designs by Messrs. Mellows and Grocock, architects, Bedford. In addition to two large class-rooms, provision is made for a lecture room, a life room, an antique room, elementary Art room, wood-carving room, dark room, and chemical laboratory, besides a master's room, cloak rooms, and a room for the caretaker.

OLDHAM.—The new banking premises just opened in Shaw, near Oldham, by the Oldham Joint Stock Banking Company, branch of the London and Midland Bank, Limited, are situated in Rochdale Road and Chapel Street. They form most commodious and convenient premises, and comprise a banking room, manager's office, &c., and a house for the local manager. The whole forms one of the chief architectural features of Shaw. The exterior of the bank is a free treatment of classical design, in polished masonry. The interior is cased in faience and tiles, a special glaze being used. The lighting is from the ceiling, this being of Venetian rippled glass, giving a most subdued light. The fittings are of mahogany and walnut. The following is a list of contractors by whom the various works have been completed:—Messrs. S. and J. Whitehead, Oldham, masonry; Mr. Whitworth Whittaker, Oldham, brickwork; Messrs. Stanley Bates and Son, Oldham, plumbing and glazing; Mr. R. C. Fletcher, Oldham, slating; Mr. James Hall, Oldham, plastering; Messrs. W. A. Peters and Son, Rochdale, carpenter and joinery; Mr. Alfred Whitehead, Leeds, tilework and faience; Messrs. Pearsons and Brown, Manchester, bank fittings; Messrs. J. and H. Patteson, Manchester, granite and marble work; and Messrs. J. G. Wagstaff and Co., Dukinfield, heating. The whole of the work has been designed, detailed, and superintended by Mr. Thomas Taylor, architect, 29, Queen Street, Oldham.

REDLAND.—The ceremony of dedicating the temporary church of St. Katharine, Redland, was performed on Saturday week. The building has been erected on land in Salisbury Road. At first an iron church was contemplated, but the Corporation would not sanction this, so that plans were prepared by Messrs. P. Munro and Sons for a commodious stone-built hall, which is first to be used as a church, and, when the permanent church of St. Katharine is built, it will be used as a parish hall. The building is 108ft. long and 36ft. wide, the roof rising to a height of 50ft. The chancel and sanctuary at the east end are approached by a few steps. There is a porch on the north-west side. The building, which is constructed of pennant stone, is Gothic in style, the open roof being of pitch pine, and covered with Broseley tiles.

Under Discussion.

THE ARCHITECTURAL ASSOCIATION.

At the meeting of the Architectural Association on Friday, the President (Mr. G. H. Fellowes Prynn) in the chair, the business items included a vote of thanks to those artists whose work was on view at the Association's conversazione held on the previous Friday, and also votes of thanks to Mr. Arthur Cates, who has presented several office fittings, books, &c., to the Association. The following candidates were elected members of the Association:—Messrs. David Good, A. E. Brown, E. A. Agutter, Leonard Judge, P. J. Turner, F. G. Allsopp, T. B. Ball, H. R. Bird, E. D. Ford, H. J. Gravenor, R. Knott, J. Mansell, H. J. C. Marshall, E. J. Martin, G. J. Morris, C. P. Moss, J. Myers, S. V. North, W. Paice, jun., A. G. A. Quibell, E. M. Reeves, F. V. Rider, W. H. Rogers, G. L. T. Sharp, G. S. Simpson, M. Skinner, C. F. Skipper, W. Thornton, J. E. Tindall, H. M. Whiddington, C. S. Yates, C. E. Simmons, C. H. Smith, A. Durst, and E. Brantwood-Muff. Mr. John E. Newberry then read a paper, illustrated with lantern views, on "The Excavations at Thebes," which Mr. Newberry assisted to carry out for the Egyptian Exploration Fund. The text of this paper will be found on another page of this journal. The paper evoked a fine discussion, in which the President, Messrs. Phené Spiers, Alexander Payne, H. V. Lanchester, and Alex. Wood took part.—The next meeting of the Architectural Association will be held on November 11th, when Mr. H. Wilson will read a paper on "Arts and Crafts."

INSTITUTION OF MECHANICAL ENGINEERS.

The ordinary general meeting of the members of the Institution of Mechanical Engineers was held last Wednesday at the hall of the Institution of Civil Engineers, Gt. George-street, Westminster, Mr. Samuel W. Johnson, the president, being in the chair. The president, who retires from office at the ensuing annual general meeting, announced that Sir W. H. White, Chief Constructor of the Royal Navy, had been nominated for the post of president, Mr. T. Harry Riches as a vice-president, and Sir William Arrol, M.P., Sir Benjamin Baker, Mr. Henry Chapman, Mr. W. J. Pirrie, and Sir T. Richardson, M.P., as members of the council. Papers on "Electric Installations for Lighting and Power on the Midland Railway, with notes on Power Absorbed by Shafting and Belting," by Mr. W. E. Langdon (Derby), and "Results of Recent Practical Experience with Express Locomotive Engines," by Mr. W. M. Smith (Gateshead), were afterwards read.

VENTILATION.

A lecture on ventilation was delivered by Mr. Low at the last meeting of the Glasgow Architectural Association. Questions regarding the quantity of air required, the cubic space of room necessary per person, and the necessary purity of air fit for breathing, were gone into closely. Although carbonic acid gas was an impurity, it was more the presence of organic matter that rendered air unfit for breathing. One of the greatest difficulties ventilating engineers had to contend with was the difficulty of ventilating comparatively small rooms, without causing a draught, and this, no matter what system was adopted. Mr. Low described each system of ventilation in turn, referring to different buildings ventilated by each method. The natural system was illustrated by several very interesting experiments, made with small models, and, more particularly, with a small model of a room. The failure of cows as foul air extractors was pointed out. The whole series of experiments tended to shew how difficult and uncertain natural ventilation was under certain conditions and circumstances. On the motion of the chairman, a vote of thanks was accorded Mr. Low for his interesting paper.

Enquiry Department.

ARCHITECTURAL SCHOLARSHIPS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR EDITOR,—Could you give me the subjects which one has to study before entering for a Whitworth Scholarship? Are there any other Scholarships connected with Architecture or Building Construction, and where are they held?—Yours truly, J. McA.

If you think of competing for the Whitworth Scholarships you must write to Messrs. Eyre and Spottiswoode, East Harding Street, Fetter Lane, E.C., for "Department Science and Art, Publication No. 455, Prospectus of the Whitworth Scholarships and Exhibitions," enclosing seven stamps, when you will be sent post-free a pamphlet giving all particulars. We know of no other scholarships in Architecture and Building Construction, though smaller prizes are given by the various Architectural Schools in London. There is a prize of £200 given every alternate year to the author of the best Architectural design to a set subject among the students at the Royal Academy; and there are several valuable prizes and travelling studentships offered yearly by the Royal Institute of British Architects for drawing, design, and construction, full particulars of which will be found in the "Supplement to the Kalender," which will be sent you by the Secretary R.I.B.A., 9, Conduit Street, Hanover Square, on receipt of 4d.

ELECTRIC CURRENT.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—First: Would the presence of mud and dirt, &c., between sheet copper and rusty steel, though the two are bolted together, interfere with the efficient passing from one to the other of an electric current? Second: Assuming the answer to the above is yes, is there anything cheap and efficient I could place between the two metals so as to prevent the entrance of mud and dirt, &c., and which would not interfere with the current?—Thanking you in anticipation, I am yours, E. R.

In the absence of more precise information, it is difficult to reply to your questions except in general terms. Assuming the plates to be held apart, with an intervening air space, the intention apparently is that the bolts referred to should form the medium for transmission. In such case the interposition of foreign matter, and the presence of rust (which is a non-conductor) would be less calculated to cause interference with the electric current than the presence of dry air, which possesses the quality of non-conduction in a high degree. Mud and dirt, although convenient and familiar colloquialisms, designating equally familiar but less convenient compounds, do not convey very definite impressions to the scientific mind. Dry mud, being largely constituted of such substances as dry wood, paper, straw, metallic oxides, oils, lime, chalk, hair, wool, etc., may be safely regarded as a non-conductor. Liquid mud, on the other hand, in virtue of the water contained, may be a fairly good conductor of electricity. Metallic contact is naturally preferable, and if our correspondent will forward a sketch with measurements and give at the same time particulars as to the conditions under which the apparatus is required to work, we shall be in a position to give a definite opinion as to the proper course for adoption.

At the Salford Police Court last week, John Ward, builder, Barrfield Road, Pendleton, was summoned for a breach of the Salford Improvement Act, 1871, by building half-brick partition walls in the construction of six dwelling-houses in Barrfield Road without placing a course of hoop-iron in every story. The defendant, who said he had trusted to another man to do the work properly, was fined £30 and costs.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ABERDEEN.—For the erection of a bridge at the Links, for the Town Council. Mr. J. Rust, City Architect, Town House, Aberdeen. Quantities by architect:—
Gall and Walker... £540 16 0 Scott and Sellar... £357 19 0
Charles Gordon... 429 15 0 John Morgan... 355 0 0
Pringle and Slessor... 419 0 0 Thomas Grant... 350 10 0
P. Bisset and Son... 373 15 0 Leslie Smith... 347 0 0
Edgar Gauld... 371 16 3 George Hall... 337 10 0
A. Milne and Son... 369 18 0 Geo. Fordyce & Co.
Robert Beattie... 365 10 0 Aberdeen*... 320 0 0
* Accepted.

BELVEDERE.—For the erection of six cottages at Parsonage Farm, Belvedere, Kent, for the trustees of the late Lord Wynford. Mr. G. St. Pierre Harris, architect, 8, Ironmonger-lane, E.C., and Orpington, Kent:—
G. Miles... £1,938 Stebbings and Pannell £1,680
S. H. Gunning... 1,300 F. Hind... 1,350
T. Knight... 1,739

CAMBORNE.—For the erection of masonic buildings. Mr. Sampson Hill, architect, Redruth:—
C. and J. Harris £1,141 15 0 Trounson and Mitchell... £389 0 0
J. Beryman... 1,050 0 0 W. C. Hodge... 854 0 0
Trounson and Haslett... 1,013 0 0 Barbary and Mitchell... 827 8 7
Whys & Moffat 891 0 0 and Croun*
* Accepted.

CORNWALL.—Accepted for billiard room and bedrooms, additions to Torrey, Cornwall, for Mr. W. G. Mills. Mr. Sampson Hill, architect, Redruth:—
N. Penter, Pothman... £550

CROYDON.—For erecting the "Leslie Arms" Hotel, and four shops adjoining, for Messrs. Nalder and Collyer, Limited. Messrs. Berney and Sons, architects and surveyors, Croydon:—

Edwards and Medway £10,700 J. Smith and Sons... £10,420
J. J. Carrick... 10,366 S. Hart... 10,297
Lorden and Sons... 10,540 E. P. Bullock and Co. 10,050
W. H. Lascelles and Co. 10,437 Hanscomb and Smith 9,433
Patman and Fotheringham... 10,475 F. Bullock... 9,384
Joselyne and Young... 10,455 S. Page... 9,021
S. J. Jerrard and Sons 10,439 D. W. Barker, Croydon (accepted)... 8,937
J. Carmichael... 10,430

EVESHAM.—For building a bridge, &c., Bengeworth and Badsey, for the Urban District Council:—
Thos. Vale Stourport, Evesham... £200

FARNBOROUGH.—For the erection of a new Girl's School at Farnborough, Kent, Mr. St. Pierre Harris, architect, 8, Ironmonger-lane, E.C., and Orpington. Quantities by Messrs. Stanger and Son:—
G. E. Wallis & Sons... £3,178 F. Jones... £2,975
J. C. Arnaud & Son... 3,834 H. Somerford & Son... 2,960
W. Holt & Son... 2,999 T. D. Grady*... 2,898
* Accepted.

FEATHERSTONE (Yorks.).—For laying 2½ miles of water mains for the Urban District Council. Mr. W. A. Palliser, engineer, Council Offices, Featherstone:—

	Per yard laying.	Per valve fixing.	Per chamber.
T. Rowland	1 5½	0 2 6	0 6 0
Jenkins & Son	3 0	0 7 6	0 7 6
E. Cheetham	3 0	2 10 0	—
W. Doleman	1 9	0 15 0	—
W. Barrick	1 0	—	—
M. Arundel	1 6	0 10 0	—
A. Henson, Leeds*	1 3½	0 10 0	—
H. W. Jowitz	2 0	0 3 0	0 10 0

HELSTON (Cornwall).—Accepted for music-room and bedrooms and alterations to stables at Bonallack, Helston, for Mr. F. C. Baddeley. Mr. Sampson Hill, architect:—
W. J. Winn, Helston... £706

ILKLEY.—For the erection of a detached house. Messrs. Iait, Adkin, and Hill, architects, Prudential Buildings, Bradford:—

Masonry.—S. Mounsey and Son, Oxford-road, Guiseley... £395 0
Joinery.—J. and B. Emmott, Addingham... 400 0
Plumbing.—T. L. Nelson, 5, Wharfe-view, Ilkley... 192 0
Slating.—R. Nelson, 5, Wharfe-view, Ilkley... 64 10
Plastering.—F. Dean, Stott Hall, Clayton Heights, Bradford... 144 0

KINGSCLORE (Hants.).—For the erection of six cottages, for the Ancient Order of Foresters. Mr. W. H. Bell, architect, Market-place, Newbury:—
Hoskings... £1,700 Garrett... £1,152
Bance... 3,220 Head, Burghclere*... 1,140
* Accepted.

LEDBURY.—For the execution of sewerage works, for the Urban District Council. Mr. R. E. W. Berrington, engineer, Bank-buildings, Wolverhampton:—
J. Braithwaite and Co. £4,000 J. McKay... £2,876
J. Smith... 3,397 J. Evans... 2,849
J. Meredith... 3,274 H. Holloway... 2,733
H. Vale... 3,063 J. Bentley... 2,616
G. Law... 2,878 Johnson Bros. Hereford (accepted)... 2,528
[Engineer's estimate, £2,700.]

LEICESTER.—For additions to museum buildings, Hastings-street, for the Corporation. Mr. Geo. Mawbey, C.E., Town Hall, Leicester:—
T. F. Scott... £1,912 4 1 J. Riddett & Sons £1,728 0 0
W. G. Harrison... 1,872 7 11 W. Haddon... 1,701 0 0
F. Neal... 1,860 0 0 Clark & Garrett 1,696 15 0
J. E. Tyers... 1,832 0 0 H. T. & W. Chambers... 1,635 2 6
Sons... 1,830 13 9 T. Herbert, Well-ford-road, Leicester*... 1,608 0 0
G. Brown & Son 1,787 0 0
H. Herbert and Sons... 1,746 10 0
* Accepted.

LEYTON (Essex).—For widening part of Grove Green-road, for the Urban District Council. Mr. W. Dewson, C.E., Town Hall, Leyton:—
G. J. Anderson... £874 7 6 W. & C. French, Buckhurst Hill* £734 0 0
Geo. Wilson... 791 13 0
Wm. Griffiths... 769 15 10
* Accepted.

LONDON.—For the erection of two shops in the Harrow-road and Wellington-road, W., for Mr. Edward Reed. Mr. G. H. Green, architect, 340, High-road, Kilburn, N.W., and Chesham, Bucks. Quantities by Mr. Henry Bushell, 33, New Bridge-street, E.C.:—

Yerbury & Sons... £3,939 J. Bennet... £3,200
Langley & Pinkham... 3,789 W. H. Stone... 3,100
Ransom & Co... 3,708 G. Neal... 2,997
Cowley & Drake... 3,745 T. W. Rhodes, Stoke Oldrey & Son... 3,250 Newington (accepted) 2,966

LONDON.—Accepted for alterations and additions at "Bechfield," Wigmore-road, Bromley, for Mr. W. Cave. Mr. G. Gordon Stanham, architect, 100B, Queen Victoria-street, E.C.:—

J. Appleby, Cornwall-road, S.E. £753
LONDON.—For new detached residence at Westmoreland-road, Bromley, for Mr. John Bransdon:—
Stebbing & Pannett... £2,050 J. Appleby, Cornwall-Knight... 2,047 road*... £1,997
* Accepted.

LONDON.—For new factory at Marigold-street, Bermondsey. Mr. Edward Crosse, architect:—
F. & H. F. Higgs... £4,168 J. Chalkley... £2,997
Joselyne & Young... 3,217 B. Wells (accepted) 2,949

LONDON.—Accepted for alterations and fittings, No. 137, Cheapside, for Messrs. Cave and Benoit. Mr. G. Gordon Stanham, architect, 100B, Queen-Victoria-street, E.C.

LONDON.—For the supply of gas-engines for the Lots-road pumping station, for the London County Council:—
Crossley Bros... £10,744 6 5 J. E. H. Andrews and Co. Ltd. £10,300 0 0
J. Taylor and Sons, Ltd... 10,620 0 0 Cambell Gas-Engine Co., Ltd. 10,000 0 0
Fielding & Platt Ltd... 10,450 0 0 Premier Gas-Engine Co. Ltd. 9,590 0 0

LONDON.—For the erection of a Nurses' Home for the Royal Hospital for Consumption, Brompton, S.W. Mr. Edwin T. Hall, architect, 57, Moorgate-street, E.C.:—
Leslie and Co... £20,895 G. and H. Bywaters... £23,650
Leslie and Co... 39,654 Higgs and Hill... 33,240
Henry Lovatt... 34,176 Lawrence and Son... 32,954
Woodward and Co... 33,890 Foster and Dickies... 32,476
Kilby and Gayford... 33,774

LONDON.—Accepted for alterations and additions to "The Atlantic" public-house, 388, Coldharbour-lane, Brixton, S.W., for Mr. W. F. Chapman. Mr. A. B. Robb, architect:—
Spencer and Co., Lambeth... £4,227

CONTRACTS OPEN.**CALEDONIAN RAILWAY COMPANY.**

EDINBURGH STATION HOTEL.

CONTRACT FOR MASON WORK AND IRON AND STEEL WORKS.

The Directors of the Caledonian Railway Company invite TENDERS for the MASON WORK and IRON

and STEEL WORK of the new Hotel to be erected at Prince's-street Station, Edinburgh.

The drawings and conditions of contract may be seen at the Office of Messrs. PEDDIE and WASHINGTON BROWNE, Architects, 6, Albyn-place, Edinburgh, on and after MONDAY, the 17th inst.

Copies of the specification, schedule of quantities, and form of Tender may be obtained from the Architects on payment of a deposit of Two Guineas per copy for the Mason Work, and One Guinea per copy for the Iron and Steel Work.

Sealed Tenders, addressed to the undersigned, and marked "Tender for Edinburgh Station Hotel," must be lodged with him on or before MONDAY, NOVEMBER 7th, 1898.

The Directors do not bind themselves to accept the lowest or any of the Tenders.

J. BLACKBURN,
Secretary.Caledonian Railway Company's Offices,

INTRODUCTION OF NON-FLAMMABLE WOOD INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to
Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"IOWA" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.
"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known
colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING,
(each of which is over eighteen stories high).

"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company
by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,

2, Army and Navy Mansions, Victoria Street, London, S.W.

Protective Metallic Coatings for Iron and Steel.*

By SHERARD COWPER-COLES,
Assoc. M. Inst. C.E., M.I. Mech.E., M.Inst.E.E.

(Continued from page xci.)

THE author will now briefly touch on the nature of the protection that zinc affords. Iron coated with zinc, after a short exposure, becomes covered with a thin film of oxide, which gradually passes into a basic carbonate and adheres tenaciously, forming a protective covering to the zinc. So long, therefore, as the zinc surface remains intact, the underlying iron is effectively protected from corrosive action. The nature of the protective influence of the zinc on the iron is galvanic, zinc being electro-positive to iron. Two metals in contact in the presence of moisture form a galvanic couple, and the result of the galvanic action set up under these conditions is analogous to that which takes place in a galvanic battery, viz., the electro-negative element remains unaffected so long as the action continues, the intensity of the chemical action being governed by the relative positions of the two metals in the electro-chemical series. This electro-chemical action is sometimes curiously shown in fagoted iron bars. After lying about for some time the bars may be found to be rusted, not uniformly, but in parallel streaks running lengthways of the rod, these streaks giving the rod the appearance of having been built up of

A NUMBER OF PARALLEL PLATES.

This is evidence that the rod was originally made from fagoted iron, and the difference in the electro-chemical condition of the alternate layers has given rise to the oxidation only of the alternate positive layers. The effect of stress is also found to have considerable effect on the corrosion of metals. Tin and iron, and copper and iron, standing some distance apart in the series, give rise to a decided galvanic action, in which the iron, as the electro-positive metal, is corroded more rapidly if the coating is partly removed than it would be if not coated at all. For this reason copper sheathing, which was first used for vessels of the English Navy about the year 1770, is now insulated from the iron or steel hull by wood casing. This practice, no doubt, led to the strange blunder of H.M.S. Audacious being cased in wood, to which insulated zinc sheets were fastened, thus rendering the zinc quite worthless as a protection to the iron. With zinc and iron the positions of copper and iron, and tin and iron, are reversed. Zinc is positive to iron, and, consequently, whatever galvanic action is set up by their contact in the presence of moisture or other excitants must have for effect the solution or corrosion of the zinc and the protection of the iron. An interesting example is reported of

ELECTROLYTICAL ACTION

which was observed to have taken place in some brass condenser tubes in a cruiser, which, after being in service for a year or more, were found to have experienced a peculiar change. In many places the metal was changed to almost pure copper of a spongy texture, the zinc having completely disappeared. An investigation showed the probable cause of the failure to have been an electrolytic action between the tin lining of the tubes and the brass, the sea water circulating through the condenser forming the electrolyte. Had the tin coating remained perfect, no corrosion would have resulted; but the mud and grit carried in suspension through the condenser cut away the tin lining in places, and it was at these places that the change of the metal occurred. It may be concluded that if the tubes had been coated with a metal electro-positive to the brass, or had not been tinned at all, they would have remained intact. At the present time galvanising has assumed the proportions of a very large industry, and is rapidly increasing now that steel of small

section is being extensively used for constructional purposes. As compared with tinning, however, galvanising is

A COMPARATIVELY NEW INDUSTRY,

having been worked in Europe only since the early part of the present century, and introduced into the United States from England. Messrs. Morewood and Rogers appear to have been the first to produce commercially galvanised sheets. In December 1846 they took out a patent for immersing articles in a bath of molten zinc, or an alloy of lead, zinc, and tin, or zinc iron alloy, the surface of the molten metal being covered with sal-ammoniac or chloride of manganese. To equalise the coating they employed rollers, revolving in a flux kept at a lower temperature than the melting point of the coating metal. The chief improvements effected in hot galvanising since its introduction have been in the construction and arrangements of the baths, and in the mechanical appliances for reducing the weight of spelter to the superficial foot. Rolled plates thus produced are not considered to be as good as flux plates, which have an average thickness of zinc of two ounces to the superficial square foot. Messrs. Davis and Sons, of Wolverhampton, have introduced

A SYSTEM OF WET ROLLING

the plates after annealing and pickling, the advantages claimed being a more uniform coating of zinc with a smaller consumption of spelter. Another innovation is gas firing, which is being experimented with in place of coke or coal. The term "galvanised iron," applied to iron that has been passed through a bath of molten zinc, is somewhat misleading, since it would seem to imply that the coating was effected by a galvanic current. It is intended, however, to apply to the nature of the protective influence, and not to the process. Lead also is sometimes used as a protective coating for iron, but, though lead galvanising is almost as old an industry as zinc galvanising, it has a very limited field, for two reasons. In the first place, it affords no better protection to iron than tin when once the coating is penetrated; and in the second place, its toxic properties render the indiscriminate use of lead-covered articles dangerous. The comparative inertia of lead to the chemical action of many acids has given rise to the contention that it should form as good a protection to iron as zinc, if not, indeed, a better one. But a piece of lead-coated iron or terne plate, cut from a sheet and placed in water, will rust badly in the course of twenty-four hours, the water and plate being discoloured with red oxide. The use to which

LEAD OR TERNE PLATE

(which contains a small percentage of tin added for the purpose of ensuring a more homogeneous coating) is principally applied, is for manufacturing boxes. Terne plate usually has about 3oz. of metal per superficial square foot. Attempts have been made to introduce lead-coated sheets for roofing and general purposes, but in several instances the plates were found to have rusted even before arriving at their destination. At one time a considerable quantity of lead-coated sheets were sent to Sweden to avoid the heavy duty of 66s. per ton on zinc galvanised goods, but no market was found for the sheets, and the enterprise was eventually abandoned. An American process, patented by T. J. Clamer in 1893, and recently brought over to England, was experimented with on a commercial scale for coating iron and steel. According to the inventor, "lead while in a molten state absorbs various gases from its surroundings and the atmosphere, the gases thus absorbed prevent the lead from adhering closely to the surface of metals, and cause the small holes and blisters so frequently found in a sheet of metal coated with lead in the usual way." Messrs. Neumann and Streintz found that lead absorbed about one-eighth of a volume of hydrogen when the dry gas was passed over the heated metal. Mr. Clamer's process consists of

FUSING THE LEAD

to be used as the coating metal, under powered charcoal, and to every 100lb. of lead

adding, first 3oz. of sal-ammoniac, secondly 1oz. of arsenic, then 1oz. of phosphorus, and lastly, 1oz. of borax or a similar flux. About the same time as Mr. Clamer's process was put on the market, a process, called "Dinizing," for coating articles with a lead alloy, was experimented with; the object being to render the lead electro-positive to the iron. Small quantities of sodium were mixed with the lead, ammonium chloride being used as a flux. Lead-coated wires have never been adopted by engineers, apparently on account of the electro-chemical difficulties, although manufacturers of steel wire ropes and cables for haulage purposes have on several occasions had their attention drawn to lead as a protective and lubricating coating. Lead galvanising does not reduce the tensile strength of wires like hot galvanising. The surfaces obtained by hot and by cold galvanising differ considerably in appearance. Hot galvanised articles are often covered with large spangles or crystals, which are obtained by adding small quantities of tin to the galvanising bath; but this attractive appearance is gained at the cost of the durability of the protection afforded to the underlying metal, as the spangles render the coating unequal in thickness and inferior in quality. For these reasons some of our leading engineers now specify that galvanised sheets shall be without spangle, and carry zinc to the weight of one ounce per square foot.

PAINT DOES NOT ADHERE

firmly to zinc surfaces, so to increase the tenacity a varnish containing a small quantity of alkali is applied, which gives a slight roughness or mat to the zinc surface. The zinc on electro-zincd articles coated by the usual methods has an unhealthy non-metallic look, which has created considerable prejudice against such articles when compared with the brilliancy and glitter of the spangles obtained by the hot process. The dull surface of the electro-deposited zinc can, by the adjustment of the current, be developed into a mat surface, which has been found especially suitable for the coating of nails, as it increases the holding properties, whilst, on the other hand, galvanising decreases the holding power. Galvanising roofing sheets is one of the largest, if not the largest, branch of the galvanising trade. Modern galvanising plants are generally fitted with a stretching machine to remove any buckles from the sheets before placing them in the galvanising bath. The average output of a galvanising bath is about 7 tons in twenty-four hours, or four baths working continuously would turn out about 270 tons per week.

THE COST OF ANNEALING

1 ton of sheets about 24 gauge is 2s. 6d.; and the cost of pickling, 7s. The percentage of wasters averages about 7½ per cent., due to improper cleaning, flux marks, and cracks which do not develop until after pickling. To surface-harden galvanised sheets, aluminium is sometimes added to the bath of molten zinc at the moment of dipping the iron sheets, whereby a compound surface of zinc-aluminium is formed on the articles under treatment. It has been claimed that the thin film of aluminium serves as a protecting coat to the molten zinc, reducing the formation of ashes and hard zinc to about half the amount usual where protecting covers of sal-ammoniac, fat, or glycerine are used. The addition of the aluminium also enables a thinner coat of zinc to be applied. According to the patentee of this process, metallic aluminium only enters into combination with zinc in the proportion corresponding with the atomic weights of the metals. Some galvanising workers complain that the use of aluminium in the galvanising baths gives them more zinc dross, though they say that with aluminium they can cover a larger surface and do brighter work. The formation of more dross by

THE USE OF ALUMINIUM

is probably due to two causes: first, an impure zinc, and secondly, to the excessive use of aluminium. Aluminium should be introduced gradually in the form of a five or ten per cent. aluminised zinc, and in a five ton bath

* A Paper read before the Society of Engineers, on October 3rd, 1898.

not more than half a pound of aluminised zinc should be added at a time, so that the total amount in the bath is kept somewhere about from three to six ounces of aluminium to the ton of zinc; but a very important point is that this aluminised zinc should be added gradually and not all at one time. The zinc iron alloy or dross which forms in the bath amounts in some cases to 25 per cent. of the whole of the zinc used. The quantity usually formed in the galvanising bath amounts to about one-third of the total amount of zinc used for a 24 gauge plate. The zinc iron alloy formed in the galvanising baths is sold to the manufacturers of alloys, or is subjected to distillation to recover the zinc. The zinc applied by the hot process usually contains lead, tin, and iron, and it has been found that iron above 0.13 per cent. makes the zinc too brittle to be properly bent. Lead up to about 1 per cent. is harmless, but above 1½ per cent. will not dissolve, and the excess collects and forms weak spots. Arsenic antimony, cadmium and copper also occur, but practically never in quantities sufficient to be injurious. Some zinc removed from a Siemens-Martin hot galvanised plate was found to be very brittle, breaking when attempts were made to bend it. Analysis gave the following results:—

Zinc by difference	49.2
Tin	2.20
Iron	3.78
Arsenic	Trace

The average thickness of the coating was 0.015 inch. On the other hand, zinc applied by the electro process is very pure, and it is found to resist the corroding action of a saturated solution of copper sulphate (Preece's test for Post Office telegraph wires), very much better than hot galvanised iron. A specimen of hot galvanised iron, having 1.42oz. per square foot, withstood three immersions, whilst a similar piece of iron, electro-galvanised, having 1.26 oz. per square foot, withstood five immersions, as shown in the table:—

RESULTS OF SULPHATE OF COPPER TESTS MADE ON SAMPLES OF CHARCOAL IRON, COATED WITH ZINC BY DIFFERENT PROCESSES.

Preece's Post Office Test.			
Process used to coat the Iron.	Grains per Square Foot.	Oz. per Square Foot.	Number of one minute Dips Samples stood without showing Metallic Copper.
Hot galvanising ...	648.5	1.48	3
Acid bath, ZnSO ₄ ...	446.4	1.02	4
Neutral bath, ZnSO ₄ ...	552.64	1.26	5

From this it may be inferred that with coatings of zinc of equal thickness the article coated by the electro process will withstand the ordinary corrosion due to atmospheric influence much better than steel coated by the hot galvanising process; or, expressed in other words, steel coated by the electro process will have as long a life as hot galvanised steel, with less zinc than would be necessary in the case of the ordinary hot process. In applying Preece's test, it should be remembered that copper, when first precipitated on zinc, whether from a weak or strong solution, is black, but in the latter case it becomes chocolate colour as it advances, or red if the action becomes more rapid. The saturated solution of copper sulphate should be made up with cold water, not hot, to ensure that no free acid is present. The process of electro-zincing is, however, not without its difficulties. The deposits obtained from zinc sulphate solution are adhesive only when great care is exercised in the preparation of the receiving surface. After pickling, the iron should be well washed in alkali, otherwise the acid is retained in the pores of the metal

and sows the seeds of decay. Other matters of moment are the

SLOWNESS OF ELECTRO-ZINCING

when working with a low current density, and the difficulty experienced in coating articles of irregular shape. Difficulty is also experienced from the want of adhesion, when the zinc has obtained a thickness beyond that corresponding to 1½oz. of zinc per square foot. Attempts have been made to overcome this difficulty by the method employed to make silver adhere to a baser metal, namely, by quickening, that is, immersing the copper or copper alloy to be silvered in an aqueous solution of mercury. As mercury will not amalgamate with iron, an electric current has to be employed. Dr. Leeson, in 1842, patented the use of mercury for preparing metallic surfaces for electro-deposition both by simple immersion and by the electro-deposition of mercury. The application of this process to the coating of iron with zinc is found to be too costly, the mercury also has a tendency to render the zinc coating brittle. To reduce the labour that would otherwise be necessary in zincing small articles such as bolts and nuts, successful attempts were made in 1870 to coat such articles by placing them in a revolving perforated metallic cylinder. A similar arrangement has been employed for coating steel bullet jackets with cadmium and zinc. Even when ironwork is to be painted,

A THIN PREPARATORY COATING OF ZINC

may be applied with great advantage. Engineers recognise the fact that the best results are obtained when the paint is applied direct to the iron surface, after the removal of all scale and before it has had time to rust, as the rust prevents the intimate contact of the paint, and induces chemical action which causes the paint to peel from the iron. Mr. W. John, on examining some small mounds of rust on the outside of a recently launched steel vessel, found that under each heap of rust there was a small hole in the paint, not larger than the size of a pin's head, and that beneath each hole was embedded a small particle of black oxide in a pit in the plate. No matter how many coats of paint are put on, they cannot arrest incipient oxidation, or that on the surface of a plate; four or five coats of paint fail to protect the metallic surface to any greater extent than two or three coats of anti-corrosive paint possessing a good body and texture. The system of attempting to prevent corrosion by an increased number of coats, and therefore increased thickness of paint, is a deceitful one, for by reason of the thickness of the paint any corrosion on the surface of the metal may not show through the paint by discolouring it in spots or otherwise as it will do if two coats are used. In the latter case it can be remedied, being evident, but an increased thickness of the paint may hide the oxidation that is proceeding, and the mass of coats of paint may yet have sufficient adherence

TO MASK THE DECAY

and give a false appearance of durability, until at length rust has formed to such an extent as to become detached from the surface of the metal, the paint ultimately falling off with the layer of rust attached to it. Experience shows that pigments, usually metallic oxides or carbonates, act as carriers of oxygen from the air from the underlying iron, causing it to rust. An ideal paint should have a toughness which does not depend on a perishable ingredient; its elasticity should not be diminished by cold, it should not soften but rather harden by heat, it should contain no solvents but turpentine, which experience proves to be safe, and it should contain nothing which would act as a carrier of oxygen to the metal. The durability of painted ironwork, therefore, largely depends upon the surface of the metal being properly cleaned and prepared. An excellent surface in this respect may be obtained at a very small cost by "zinc flashing," that is, coating the iron or steel after pickling with a thin coat of zinc, which will resist the effects of the weather, and retain a perfect surface for receiving a coat of paint until such time as it can be applied.

(To be continued.)

Surveying and Sanitary Notes.

THE London County Council is still building gaily its castles in the air. Its pet dream, as we all know, is to obtain control of the London water supply, and to do something colossal by establishing a new supply drawn from the Welsh valleys. The Water Committee recommend that Parliament should once more be asked to sanction these ambitious schemes, and this ingenious body, of course, takes care to point the moral of the "East London Water Famine." Had the Council been given control of the supply three years ago, it assures us, there would have been no scarcity this summer. To that the St. James's Gazette replies that, if the water in East London were not wilfully wasted, and if there were cisterns to store it in for a few hours, there would have been no scarcity, even in the late hot summer. East London, at the worst moment, received abundance of water. The real trouble was that, when the supply ceased to be constant, there was no means of storing it. That is the simple truth.

THE Herts County Council has decided to memorialise the Local Government Board as to the serious injury done to the water supply of the county by the enormous quantity of water daily abstracted by the London water companies. Sir John Evans at the last meeting strongly protested against the conclusions in the report of Lord Balfour's Commission, urging that they were totally wrong and unfair. The Chadwell Spring had failed, and the great spring at Woolmer's Park, Hertford, which formally discharged over 1,000,000 gallons per day, had gone dry, in addition to which other springs had totally failed or were greatly reduced in volume. The heads of rivers were lower down the valleys than they had ever been known. In numerous instances the wells on the highlands were completely dry, and the bore pipes in watercress beds had ceased to discharge. The Council also gave instructions for evidence to be collected as to the condition of the springs, rivers, and water supply generally, to enable protection to be secured against the disasters which it was alleged must follow if the report of Lord Balfour's Commission were allowed to stand.

THE resumed inquiry as to the value of the properties affected by the Tottenham Court Road Improvement Scheme of the London County Council, which scheme will be subject to "betterment," was held a week ago, before Mr. James Green, the arbitrator appointed by the Local Government Board. The cases dealt with comprised the Oxford Music Hall and the freehold and leasehold interests therein, and in Nos. 4, 14, and 16, Oxford Street, 1 and 1a, Tottenham Court Road, and part of 11, 12, and 13, Boziers Court. Professional evidence on both sides was given before the arbitrator, whose award will be published simultaneously with that in the Strand Improvement Scheme.

AT the Sheriff's Court, Red Lion Square, before Mr. Under-Sheriff Burchell and a special jury, a claim against the London County Council by the Clothworkers' Company was heard in respect of freehold wharf property on the Surrey side of Vauxhall Bridge, let on lease to Messrs. Francis and Co. Limited for a term, of which 52 years were unexpired, at a ground rent of £515 a year.—Sir Edward Clarke, Q.C., and Mr. Edward Boyle, Q.C., were counsel for the claimants, and they called Sir J. W. Ellis, Mr. Bousfield, and Mr. James Green, who all agreed that the value of the property, including the customary 10 per cent., was £22,660.—For the London County Council Mr. Littler, Q.C., and Mr. Morton were retained, and called Mr. Alderman Green, Mr. Farmer, Mr. Horsey, and Mr. Field, whose valuations were £14,162, including the 10 per cent.—The jury returned a verdict for the claimants for £22,660.

PRACTICAL CARPENTRY AND JOINERY.*

BY GEORGE ELLIS.

XI.—STAIRS.

THE construction of stairs is generally considered the highest branch of building joinery, although, as a matter of fact, there are many constructive problems, met with in high-class work, that are essentially more difficult to solve, and call for an equally educated eye and cunning hand for their execution; as, for instance, the panelled lining of a spherical niche, or the swelling frame of a polygonal pulpit; but as these and similar "teasers" happen but infrequently, and stair-building is an everyday occurrence, the craftsman who devotes his attention specially to this branch of his trade is tacitly placed at the head of the craft; and he certainly enjoys a privilege peculiar to himself of playing fast and loose with the architect's "plans"—an audacious proceeding which the latter views frequently with an equanimity strangely in contrast with his demeanour when any other tradesman ventures on a variation of his own. But possibly there are reasons for these things, for is it not written that a certain well-known architect did design and supervise the building of a large theatre, and did not discover until the scaffolding was struck that he had omitted to provide any stairs!

To make the following remarks upon the construction of stairs readily understandable, it will be advisable to give the definitions of the technical terms used to denote the various parts.

A *tread* is the horizontal part of a step. A *riser*, the vertical part—the two when fastened together at right angles with each other form a *step*. The portion of the *tread* overhanging the *risers* is termed the *nosing*, the moulding immediately under it the *scotia*. Steps that are parallel with each other are *fliers*; triangular ones, used to turn the direction of the stairs, *winders*; steps with curved fronts are *commodes*; a round-ended step is a *bullnose*; one with the end formed into a volute in plan is a *curtail* (Fig. 175).

The top step or finish of a flight is called a *landing*, further distinguished as quarter-

* All rights reserved by the author.

FIG. 168. ELEVATION OF DOG-LEGGED STAIRS.

space; if of the width of one flight, see Fig. 168, and half-space; if the width of both flights, as in Fig. 169. Strings are the inclined sides of the stairs, into which the steps are framed. When the strings rise above the steps, as in the elevation Fig. 168, they are termed *close* or *housed*; when they are shaped to fit the end of the steps as in Fig. 173, *cut* or *open* strings, these are further distinguished as bracketted; when the ends of the risers are mitred to an ornamental bracket, as at E Fig. 173. A *wreathed* string is one rising over the part or whole of a circular plan. A *flight* is a complete set of steps between a floor and landing, when applied to circular stairs, one complete revolution is termed a flight. The *going* is the horizontal distance between the faces of two adjacent risers. The *rise*, the vertical distance between the faces of two

treads. The *pitch-board*, a thin triangular templet, one of whose sides equals the going, the other at right angles, the rise, and the third giving the pitch of the stairs; it is used for setting out the strings. The *going of the flight* is the horizontal distance between the first and last risers of the flight; the *rise of the flight*, the vertical distance from floor to landing, or from floor to top flyer. *Nosing line*, an imaginary line touching the salient angles of treads and risers in any flight, used for setting out the strings and handrails. The line of nosings, a line drawn tangent to the nosings of the steps. *Staircase*, the trimmed opening for the stairs. *Apron linings*, the vertical linings of the exposed portions of the trimmers. *Well*, is the space between outer strings of successive flights. *Carriages* are rough timbers framed under fliers to stiffen the stairs. *Bearers*, similar pieces under winders, see B Figs. 168 and 169. *Rough brackets*, pieces of stuff, cut to fit between the step and carriage, see D Fig. 173. When the brackets are out of the solid, and the carriage dispensed with, they are then termed *rough strings*. *Spandrel* is the triangular space bounded by the under edge of the string, the floor, and the wall or other vertical member. *Newel* is a substantial post supporting the ends of string and handrail; *balusters*, the intermediate lighter posts guarding the ends of the steps. *Handrail*, the moulded rail supported by balusters and newels, and parallel with nosing line of stairs. The *core*, a thin iron rail sunk flush with the under side of and used to strengthen the handrail. *Turn* is a horizontal curve or change of direction in the rail. A *ramp*, a vertical, concave curve. A *knee*, a vertical convex curve. *Swansneck*, the two latter combined in one curve. A *wreath*, a helical curve in the rail. The wreath-piece is the circular portion connecting the straight rails in geometrical stairs. *Cap*, the top of a newel forming the termination of the rail; when placed over a curtail step, it is termed a scroll cap. The *story rod* is a staff used for taking the height of the stairs between the surfaces of two floors; it is shown in Fig. 168 with the risers spaced thereon.

WOODEN STAIRS are of two distinct classes. In the first of these the newel forms an essential part of the construction; in the second it is used merely as a subsidiary and ornamental adjunct to the handrail. To the former class belong the dog-legged, open newel, and circular newel forms; to the latter, the geometrical and the circular well. In the dog-legged variety (see plan and section Fig.

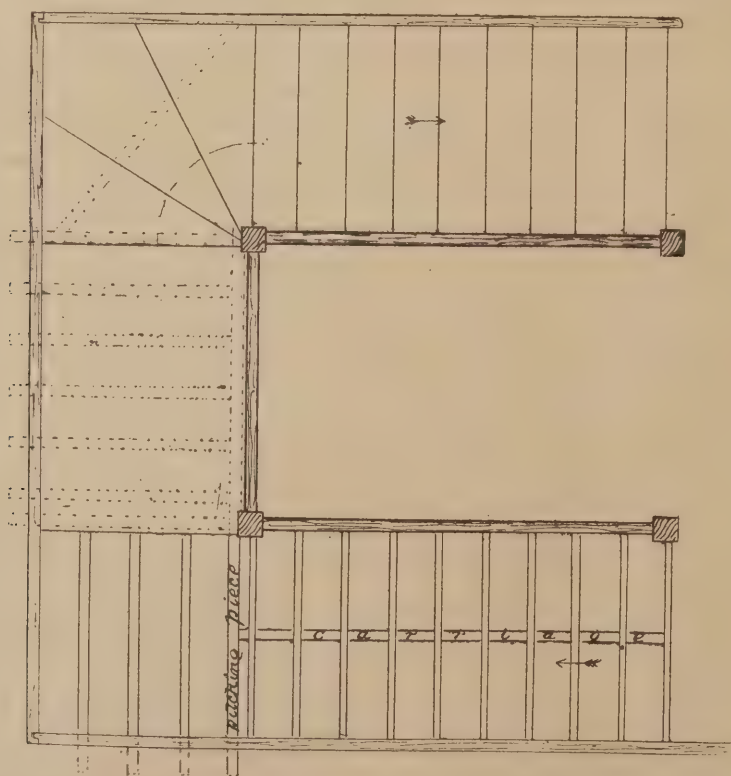

FIG. 169. PLAN OPEN NEWELLED STAIRS.

FIG. 170. PLAN OF GEOMETRICAL STAIRS.

68) the outer strings of successive flights are in the same vertical plane, both being framed into the same newel. Open newel stairs (Fig. 69) have rectangular plans, with a space or "well" between the strings, and a newel at every change of direction. Circular newel stairs have a circular plan, with the steps radiating from a solid newel running the entire height of the staircase (see Fig. 171). Geometrical stairs (so called because the construction of the strings and handrails necessitates a knowledge of solid geometry) are those in which the outer strings and handrail proceed continuously from bottom to top of the flights; their plans are always curved and symmetrical at the change of direction (see Fig. 170). Circular well stairs have continuous outer strings over circular plans, the plan of the wall string being rectangular or polygonal. See Fig. 172. A variety of these but little used, in consequence of their inherent weakness, is the self-supporting stairs; these have both strings continuous, and stand clear of all walls; their stability mainly depends upon iron bands, sunk in the strings. In the planning of stairs due attention must be paid to the position of windows and doors contiguous to the staircase, and the position of the trimmers should be arranged to secure the necessary head room; this should not be less than 7ft., measured vertically from the front edge of trimmer to the step immediately beneath. Stairs should be well lighted. A top light is best, but is seldom possible in dwelling houses; avoid, however, taking the string across a window; this is both unsightly and unsanitary. The start and finish should never be less than 12in. from a doorway. Landings at the turns are safer than winders, and should be used in preference, if the necessary rise can be obtained. In geometrical stairs the appearance of the rail is much better with the former than with the latter. A single step separating landings is very dangerous, and should be avoided. Landings must be of the same width as the stairs, and these should never be less than 2ft. 8in. in the clear. Winder risers in newel stairs are made to radiate from the centre of newel, but in geometrical stairs they are usually "balanced" on the string line to prevent the fall of the handrail being so steep. This is accomplished by cribbing a few inches from the first and last fliers of the two flights, and adding them to the narrow ends of the winders, thus increasing the width of the latter.

The method of spacing the winders is shown in Fig. 170, and is as follows: Having drawn the plan, and laid down the fliers as far as the springing line of the semi-circle, describe an arc from the centre of well at 18in. from the inside of string; divide this arc into as many equal parts as there are to be winders; set off on the inside of the string from lin. to 3in. beyond the springing, according to the width of treads, and divide the portion of string included into the same number of equal parts as the arc aforementioned, and draw the riser lines through the points so found. The first and last steps, not taking part in the turn, are not winders, but "diminished fliers;" only one step on each flight should be so treated, or an unsightly easing will be necessary in the handrail. Avoid, where possible, taking a winder into the angle of the two strings, as an excessively long step results, awkward to fit a carpet to or to keep clean.

(To be continued.)

A WONDERFUL ENGINEERING SCHEME.

M. BERLIER, the famous French engineer, is at present engaged on a scheme which will place Bombay within a week's journey of London. Of course, the chief difficulties in the way of a railway which should travel between London and Bombay in one direct route are the Channel and the Straits of Gibraltar. "The Channel Tunnel is a difficulty," M. Berlier has explained to a Daily Mail correspondent, "which seems likely, for political reasons, to remain insurmountable, but as far as the Straits of Gibraltar are concerned I have solved the problem. The depth of the Straits between the nearest points on the Spanish and Moroccan coasts, which are only a little more than eight miles apart was, I found,

TOO GREAT FOR A TUNNEL

to be built there, being no less than 1980ft., but a tunnel from Vaqueros on the Spanish coast to Tangier on the Morocco side, although nearly nineteen miles long, would be easy to build, the depth at this point being only about 1300ft., and the bottom good firm rock. I have a new system ready worked out for the removal of the debris in the building of my

FIG. 171. PLAN OF CIRCULAR NEWEL STAIRS.

tunnel, which will enable me to get through the work with far greater rapidity than has hitherto been possible, and I intend, as far as possible, to employ Chinamen in its construction, as, indeed, in the construction of the whole line of railway. Now let us take our London-Bombay railway from the start. Look at this map, and follow me carefully. You will start, let us say, from Charing Cross, travel to Dover, and arrive, without accident I hope, in Calais. From the moment you have installed yourself in your carriage at the Calais pier station you need not leave it until you reach Bombay, where, if my calculations are correct—and I have every reason to believe them to be so—you should arrive within six days and ten hours after your departure from London. From Calais you would travel upon already existing lines through Paris direct to Madrid, and from Madrid direct to Gibraltar. Here you enter the tunnel, which will, of course, be

BRIGHTLY LIGHTED AND WELL VENTILATED

—in fact, we shall have to guard rather against excess of ventilation than the reverse—and which it should take you about forty minutes to traverse, and you will be on the African continent, at Tangier, without having left the carriage into which you got at Calais. From Tangier I propose building a line about 270 miles in length, which would connect at Tlemcen with the already existing Algerian railway, upon which you would travel via Constantine to Tunis. From Tunis you will travel in a direct line through Tripoli and Cairo to the Persian Gulf; but a small branch line, either at Cairo or at Akhba, will permit you, if you can spare the time, to make a detour, so as to include Jerusalem on your journey. From the Persian Gulf to Bombay is, as you can see on the map, perfectly plain sailing, or rather railing, and, as I said at the

start, you will arrive in Bombay six days and ten hours after you left London, having only had a single hour's sea journey since your departure, and that," said M. Berlier, laughing, "an unnecessary one if politics did not exist, and

THE CHANNEL TUNNEL

did. Of course, the gauge is not the same in France and in Spain as in England, but I have perfected an automatic 'chariot' which our trains will carry, by which the change from one line to another will hardly be felt at all. There will be no difficulty whatever with the Suez Canal. It is merely a question of a tube, through which the train will pass. I have often done more difficult work than that. In fact, I want you to understand that the whole construction of the tunnel and of the railway presents no difficulties whatever, and give me seven years, and the necessary money, and I will guarantee to carry you from Calais to Bombay without any trouble whatever. The whole undertaking won't cost much—my calculations figure it out at about ninety million pounds sterling—and considering what the future of such a railway may be, I think it is cheap at the price." So far this gigantic scheme is a scheme only—a wonderful scheme, though, for all that, and M. Berlier is a wonderful man.

Trade and Craft.

THE BRITISH CLAYWORKERS' MUTUAL INSURANCE CORPORATION LTD.

At the statutory meeting of the British Clayworkers' Mutual Insurance Corporation, held at the Offices, 43, Essex Street, Strand, on Thursday week, Mr. John C. Hill, the Chairman, stated that the result of their mutual insurance scheme, which was started in June last as a protest against the excessive charges of the tariff insurance offices, had proved an extraordinary success. They had a capital of something over £16,000, and up to that time had paid in claims only £100. The Corporation was formed for the insurance of brick, tile, and pottery makers in this country, under the management of Mr. H. Greville Montgomery.

An alarming accident happened at the new Kennington Theatre, which is in course of erection at Kennington Park Road. Two large joists—measuring 12ft. by 6ft.—had been placed in position in the stagework, but had not been fixed. While some men employed by Messrs. Cawdrey and Co., the contractors for the carpentry work, were engaged in carrying timber over the joists to other parts of the job, one of the joists snapped in the middle, causing the men carrying the timber to fall a considerable distance to the floor below.

Property and Land Sales.

Sales for the Year 1898.—Telephone No. 669 Bank.—Telegraphic address, "Akaber, London."

MESSRS. BAKER & SONS beg to announce that their SALES of LANDED ESTATES, Investments, Town, Suburban, and Country Houses, business Premises, Building Lands, Ground-rents, Reversions, Shares, and other Properties will be held at the Mart, Tokenhouse-yard, E.C., on the following Fridays during the year 1898:—

October 28 | November 11 | November 25 | December 9
Auctions can be held on days besides those above specified.—11, Queen Victoria-street, E.C.

By order of the Bridge-house Estates Committee of the Corporation of the City of London.—A highly valuable Building Site, covering an area of considerably over an acre in the heart of the City.

MESSRS. BAKER and SONS are instructed by the Bridge-house Estates Committee to LET by AUCTION, on Building Lease, for a term of 80 years, at the Mart, Tokenhouse-yard, on FRIDAY, OCTOBER 28th, at TWO o'clock, to be offered in one lot, and if not so disposed of in four lots, the important BUILDING SITE, comprising Nos. 5, 6, and part of 7, West-street, Nos. 36 to 48 (inclusive), Finsbury-rows, Nos. 2 and 4, Circus-place, Nos. 101 to 116, Ondon-wall, and Albion Hall, with warehouses, &c., adjoining, occupying a total area of 49,000ft., and possessing frontages of about 750ft., offering magnificent sites for the erection of bank, insurance, and other offices, shops, professional or business premises, well worth the attention of builders, capitalists, and others, affording an opportunity seldom obtainable of acquiring prominent building sites in the City.

Particulars, plans, and conditions of sale of the CITY COMPTROLLER and CITY SURVEYOR, Guildhall, E.C.; and of the AUCTIONEERS, 11, Queen Victoria-street, E.C.

Strawberry-hill, Middlesex. Within eight minutes' walk of the Station on the L. and S.W. Railway.

MESSES. TOPPIS and HARDING will SELL by AUCTION, at the MART, E.C., on FRIDAY, NOVEMBER 11th, at TWO o'clock, actually:—

The valuable FREEHOLD PROPERTY known as Nos. 5 and 6, Waldegrave-terrace, Strawberry-hill, Middlesex, producing rentals, actual and estimated, amounting to £60 per annum, together with a plot of FREEHOLD BUILDING LAND adjoining, ripe for development, and having a frontage to Waldegrave-terrace of about 55ft., a depth of about 154ft., and an area of about one-third of an acre.

Particulars, plans, and conditions of sale may be had of the Mart, E.C.; of F. G. MELLOWS, Esq., Solicitor, Finchchurch-buildings, E.C.; and of Messrs. TOPPIS and HARDING, 66, Cannon-street, E.C.

ALTHAMSTOW, ESSEX.—93 PLOTS of exceedingly valuable FREEHOLD BUILDING LAND, free from the land and tax, being a further portion of the Rectory Manor Estate, having commanding frontages to Forest-road, and the new roads leading therefrom to Church Hill, within a few minutes' walk of Hoo-street Station on the G.E.R., from whence there is an excellent train service during the day, and half-hourly throughout the night. Fully ripe and immediately available for the erection of shops and private residences, thus affording an excellent opportunity for the creation of ground rents.—FOR SALE by AUCTION, on behalf of

THE BRITISH LAND COMPANY Limited, at the CHEQUERS, High-street, Althamstow, on THURSDAY, NOVEMBER 10th, SIX for SEVEN o'clock in the evening. Free conveyances. Purchase money payable by a deposit of 10 per cent., and the balance by easy instalments extending over nine years. The new roads are well made, coped kerbed, and good drainage provided.—Particulars, plan, and conditions of sale may be obtained of a SECRETARY, 25, Moorgate-street, E.C.; and at the office of sale.

AYLEBONE.—By Order of the Trustees of St. Luke's Parochial Schools.—Corner Building Plot, TO BE LET by AUCTION, by

NEWBON, EDWARDS, and SHEPARD (Newbon and Co.), at the MART, on THURSDAY, NOVEMBER 10th, at TWO precisely, on a Building Lease for 80 years, the valuable CORNER PLOT BUILDING LAND, having a frontage to Marylebone-lane of about 18ft., and to William-street of about 14ft., with a total area of about 1150ft. Particulars, with plans, of the AUCTIONEERS, 275, Upper-street, N.

EDWIN FOX and BOUSFIELD, At the AUCTION MART, on WEDNESDAY, NOVEMBER 16th, at TWO. Order of the Trustees of the late Edward Dewick, Esq., and another.

CITY of LONDON.—Walbrook.—FREEHOLD ESTATE, comprising No. 31, Walbrook, and No. 1, Bond-court, covering superficial area of 10ft., well lighted and possessing the conspicuous site on the upper stories of about 38ft., with a depth of 53ft., thus affording scope for the erection of handsome modern building for commercial or professional purposes. The site is at present covered with a very substantial five-story premises, for many years occupied by Messrs. Herring, Dewick, and Hardy, sole stationers, and is thoroughly sound, each or carrying heavy weights. Possession on completion of the purchase. The property is thus available for occupation in its present form, for investment by letting, or for more profitable utilisation by creating ground rent on building lease, or devoting capital to the erection of such a noble pile as will ensure a large return.

Particulars at the Mart; at Messrs. EDWIN FOX and BOUSFIELD's Office, 99, Gresham-street, Bank, E.C.; and of the Vendor's Solicitors, Messrs.

VANDERCOM, HARDY, and DOULTON, 23, Bush-lane, E.C.

ASSOCIATION OF DESIGNERS.

DESIGNS, WORKING DRAWINGS, PERSPECTIVES, ARCHITECTS, DECORATORS, & BUILDERS ASSISTED. INTERNAL DECORATIONS EXECUTED IN ALL STYLES.

ITALIAN. FLEMISH. GEORGIAN.
FRENCH. ENGLISH. ADAMS.

Offices: 20, JOHN STREET, ADELPHI, W.C.

MALLOWS, GALES, & MALLOWS,

Architectural Draughtsmen and Quantity Surveyors,

21, BUCKINGHAM STREET, STRAND, W.C.

SURREY.—Choice BUILDING ESTATE.

—In a charming district, two miles from Horley station (L.B. and S.C. Rly.) under one hour from London and adjoining a village where are church, shops, and post-office; two miles from Roman Catholic Church.

FOR SALE, a compact and valuable FREEHOLD PROPERTY of 53 acres, with a frontage to the main Brighton road of 2000ft., and perfectly ripe for development, with residences of a good class. Prettily timbered. Gas and water mains along the frontage. Would be divided.

Plans and full particulars of the owner's agents, Messrs. GREEN and SIMES, Auctioneers and Estate Agents, Blenheim Mansions, Queen Anne's-gate, London, S.W., or Mr. W. M. LEACH, Auctioneer and Estate Agent, Crawley, Sussex.

SUNNY SUSSEX (34 miles from London).

Three splendid SITES for orphanage or any large institution, or for villa residences, greatly in demand; all corner sites, with magnificent frontages to made roads; almost adjoining main line station; FOR SALE cheap; owner going abroad.—JENNINGS and FELL, Land Agents, 3, Broad Street-buildings, London, E.C. 2

R. I. B. A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Mr. W. CHURCH HOWGATE, A.R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum).

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

R. I. B. A., SOCIETY of ARCHITECTS, and CIVIL SERVICE TECHNICAL EXAMINATIONS. Preparation by correspondence, in residence, or personally.—MIDDLETON and CARDEN, 19, Craven-street, Strand, W.C.

PLANS, SPECIFICATIONS, QUANTITIES, &c., carefully prepared by young Architect. Moderate terms to those about to build.—ARTISTIC, 1, West-terrace, Whitby. 8

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

MASONS.—Constancy for steady, reliable, all-round Man; country yard near London; neat workman indispensable; good wages.—Box No. 863, Office of BUILDERS' JOURNAL. 1

TRACING and TYPE-WRITING.—VACANCIES for pupils in well-established Office. Gentlemen only.—Box 853, BUILDERS' JOURNAL Office. 1

WANTED, in a Country Office, an ASSISTANT, able to finish drawings artistically; must have knowledge of quantities; state salary, age, and experience.—Box No. 333, Office of BUILDERS' JOURNAL. 1

REQUIRED, at once, thoroughly capable all-round BUILDER'S ASSISTANT. Short-hand indispensable.—Apply, with references, and stating salary required, JENKINS and SONS, Contractors, 25, Portland-street, Southampton. 1

ARCHITECT WANTED for an Estate Agent's office. Must be able to draw plans, prepare specifications, and thoroughly understand repairs. Write, stating wages required, to ARCHITECT, care of Smith's Advertising Bureau, 51, Moorgate-street, London.

ARCHITECT and SURVEYOR'S General ASSISTANT REQUIRED at once. Thoroughly competent. Drawings, details, quantities, specifications, &c.—Full particulars, age, salary required, and references, to H. A. COOPER, Architect and Surveyor, Market Place, Kettering.

BUILDER'S CLERK WANTED. Must have good knowledge of quantities and measurement.—Write, stating salary, &c., to "W. and W.," 308A, Barking-road, Plaistow.

BUILDER'S CLERK WANTED. Must be able to take out quantities, and have had experience in preparing accounts of extra works and variations. Also able to trace drawings.—Address, stating age and salary, with copy of testimonials, to Messrs. E. PRICE and SONS, Builders, Coleham, Shrewsbury. 1

ARCHITECT'S ASSISTANT.—ASSISTANT WANTED in Architect's Office, for drafting specifications. Must be thoroughly experienced in work, especially such as relates to structural alterations, repairs, &c. Will also be required to assist with drawings. State age and experience, and forward copies of three testimonials. Salary 23 guineas per week. Hours ten to five.—Address, "C.D.," Box 296, Willing's Advertisement Offices, No. 125, Strand, W.C.

ARCHITECT'S ASSISTANT WANTED. Well up in construction, detail, and design.—Apply, stating, age, terms, qualifications, and reference, to W. H. WARD, Architect, Paradise-street, Birmingham.

APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

YOUNG ARCHITECT, A.R.I.B.A., DESIRES to ASSIST others in the PREPARATION of DRAWINGS at his own office. G. SCOREE, 23, Newman-street, W.

PERSPECTIVES.

E. BECKITT LAMB, 31, Craven-street, Charing Cross, W.C.

ARCHITECT'S JUNIOR ASSISTANT (23) desires RE-ENGAGEMENT. Four years' experience in high-class work. Good references. Student R.I.B.A.—Apply, "A.," 23, Otley-road, Harrogate. 3

SHOP FOREMAN or STAIRCASE BUILDER seeks RE-ENGAGEMENT. Well up in all classes of hardwood fittings. First-class references from last employers. Strictly sober.—G. W., 268, Milkwood-road, Herne Hill, Brixton. 1

TO SURVEYORS.—Assistance rendered in preparation of quantities, drawings, and specifications. Excellent references.—W. GOUGH, 62, Forest-road, Kew. 1

TO BUILDERS, DECORATORS, and PROPERTY OWNERS.—WORK REQUIRED by Two practical Men, having had fifteen years' first-class experience in all kinds of house decorating, and guarantee to carry out the work to the satisfaction of the surveyor; good testimonials and references; estimates given; distance no object.—Apply, W. BARKER, 7, Cecil-road, South Wimbledon. 1

ARCHITECT'S JUNIOR ASSISTANT requires RE-ENGAGEMENT. Neat draughtsman, colourist, tracer, &c. Specimens submitted. Salary moderate.—Address, J. HILLIER, 65, Glyn-road, Homerton, N.E.

ARCHITECT'S ASSISTANT (junior) seeks APPOINTMENT. Good references. Neat draughtsman, working and detail drawings, specifications, surveys. First-class certificates in freehand, perspective, and advanced building construction.—DENNER, care of Warren, Architect, Exeter.

ARCHITECT'S competent ASSISTANT desires RE-ENGAGEMENT.—W. ARMITAGE, 31, Shrubland-grove, Dalston, N.E.

WITH SURVEYING AND SANITARY SUPPLEMENTS

An Architectural Causerie.

Case for the "Horny-handed Sons of Toil."

THE letters of "A London Architect" to the daily Press upon the subject of the idleness

and insolence in the building trades, and the remarkable corroborations and amplifications they drew from various London builders, and others whose word may be held to be authoritative upon the matter, must have attracted wide attention among those concerned with the affairs of building, and awakened no inconsiderable interest and curiosity in the mind of the general public. No one who may have read the epitome we gave of the case against the bricklayers and plasterers could remain unimpressed by the justice of the indictment brought against them. One would even go so far as to assert that everyone who has had intimate dealings with the building trades must have noticed at times the existence of a systematic conspiracy of indolence, and it is common for those who are for the first time brought into personal relations with the workmen to express astonishment at the extraordinary attitude of independence and nonchalance with which, for the most part, they regard the trade that brings them their daily bread. For oneself, however, it was with a sort of pride and a deep satisfaction that one realised the perfect freedom, and the untrammelled individuality of the English artisan, as exemplified in the various building crafts. It gratified and warmed one's sentiments of patriotism and justice to know that in England the "horny-handed son of toil" was no son of toil at all; that he was a free agent, and that he was, perhaps, less embarrassed by the harsh facts of destitution and starvation than happens in the other pursuits and professions wherein men rely upon their own personal activity and abilities to keep them fed and clothed; that he toiled only when it served his purpose to do so, and not perforce under the coercion of capitalism; that, when he wished it, he dawdled; that, when he felt inclined to afford it, he took a holiday; that, should he so choose, he might be merely a dilettante in bricklaying and plastering, and remain free to educate his reason and his perceptions in the pursuit of his favourite hobby. One rejoiced to think that in England alone, of almost all the civilised nations of the world, the "son of toil" was no serf or drudge or peasant labourer, but a physical triumph of the human species, and as free to perfect the humanity given him by the Almighty as any lord in the land. If in some cases these splendid privileges are abused, more's the

pity; the privilege remains. One felt a patriotic pride to know that it was due to the liberal laws and wide justice of the English race that it was possible for the workman to withstand the coercion of the capitalist, and snap his fingers in the faces of those who would enslave him. It is regrettable that the independence of the artisan now touches upon the domain of positive despotism; a new-found power is all too readily abused. In these connections, however, the rule of life seems to be: *prey, or be preyed upon*. When the balance has been exactly adjusted between give and take, why, then will come Elysium; but from a humanitarian point of view, at least, it is surely better to see an employer at his wits' end to meet his engagements than his employés supine under the yoke of the devil of competition. And if we consider what has occasioned this strained attitude between employers and employed, as though

of their members, the individual members are as widely sundered in their proclivities as are the individual members of other classes of life. Here are two pictures, each of a workman employed upon the same identical building. The remainder lay between these two extremes of merit and demerit, but, it should be said, with a more marked affinity to the former extreme than the latter. The first was a slater. He came on to the work after the builder had been some days looking out for another hand. He said his tools were in pawn, and wished to be paid in advance that he might get them out. This the builder refused; but he acceded to his request for boots, took him home and fitted him with an old pair of his own. He also gave him a few shillings to carry on with. The man handled himself well and worked hard, having borrowed other people's tools. On Saturday he drew his pay, but he did not bring his tools on the following Monday. He brought, however, a sodden face and bleared eyes, and grumbled and asked for an advance to enable him to get

ADDITIONS TO CAMP VIEW, WIMBLEDON COMMON. MESSRS. JOHN RICHMOND AND WALTER E. HEWITT, ARCHITECTS.

the workman's worst enemy was the man who gave him work, it will be found to be a reaction by the employed against the tyranny of their employers. It was a wide, sincere, and deep-rooted discontent that provoked the activity of the labour organisations, and established the various trade unions which might meet the employers, and combat them, upon something approaching to equal grounds; and it is the security offered by the trade unions which makes the organised idleness and insolence of a certain section of the bricklayers and plasterers and their fellows possible, for it is only a certain clique or section which thus abuses the power afforded by the unions. The letters in the Daily Telegraph and elsewhere, being for the most part written with the direct object of showing the degradation to which the members of the building trades have fallen, emphasise unduly that particular aspect of the case, and give an impression as though all workmen were seriously affected with these derogatory qualities. The fact is, however, that, although the trades unions have a bad effect on the morals

his tools out of pawn. This was again refused. On Tuesday he came on the job, and did some work, and on Wednesday he also appeared, but in the middle of the morning he returned the tools he had borrowed and asked for his money. He said he was ill. He took his day and a half's pay, and could be seen hurrying down the street with one hand on his back to give an air of plausibility to his stated ill health. He turned the corner towards the public-house, and was not seen again.—The second was a foreman working bricklayer. He was fifty-four, had bright eyes like a boy, slept only four hours a day, worked through a day and a night and the next day without rest, and had twice worked three days and two nights without any sleep. He was ambidexter—could work indifferently with either hand as was most convenient to the job in progress, and would change about to rest himself. He kept ten or a dozen bricklayers to their work, and did all the awkward corners and difficult and nasty jobs with his own hand. He had worked for his employer between twenty and thirty years. B. C.

THAT the British workman is an incompetent, idle, worthless sot has long been an article of faith with the shoddyocracy of this country, but that this belief is not shared by the powers that be in foreign countries is best attested by the fact that a British workman is usually paid from two to six times the native rate, and when any undertaking of exceptional difficulty or extent is entered into his services are immediately requisitioned both to perform and superintend. To old stagers in the building trade the stereotyped charges made by "A London Architect" and his supporters in the public press will be easily recognised as old familiar friends with new faces; this time it is the bricklayer and plasterer who come under the lash—generally the sinners are the carpenter and mason, that curled darling of the scientific architect—yelept the plumber—not yet having outlived his popularity. It would serve no useful purpose to retaliate upon the "architects," "builders," and "surveyors" who have joined in the chorus of condemnation that their own houses are far from being in order, as the records of the metropolitan hospitals, police-courts, and the County Council will amply prove; but it will be well to examine some of the statements to see how far they are born out by evidence. First let us tabulate the heads of the indictment: (1) the men in question are paid "full" wages and beyond the union rate; (2) they absent themselves from work on Mondays and Tuesdays; (3) they discharge themselves at short notice; (4) they threaten to strike if their demands are not complied with; (5) plasterers object to carpenters doing plasterers' work; (6) they do as little as they possibly can, and "make the work last." To deal with these charges *seriatim*: 1st—The law of supply and demand is stronger than the most powerful trades-union, whether that of employer or employee; if men are paid higher than the current market rate it is in consequence of temporary pressure, and the fact of such payment is proof positive that it pays the capitalist to do so, because he builds not for philanthropy, but for profit. Further, if such were not the case, he would not waste time writing to the papers, but would cease building, and invest his money in some more profitable undertaking. 2nd—There may be some truth in this charge, in respect of what may be called the camp-followers of the army of labour, wastrels and devil-may-cares, samples of which may be found in all classes of society; but it is absurd to level such a charge at the head of the great body of self-supporting and self-respecting craftsmen; and so far as the complaint is justified, the employers have the remedy in their own hands, viz., promptly to discharge the offenders. They must, however, remember that human nature will assert itself; in times of slackness they are very tyrannical, discharging men relentlessly if half an hour late, or absent through any cause; in times of briskness it is their turn, and like good Britons they should "grin and bear it." 3rd—The short notice was enforced by the employers in 1867. The men would probably revert to a week's notice with pleasure. 4th—This is their birthright, but the counter-moye is held by the employer. 5th—Do not architects object to builders and surveyors "working without plans?" And after all the man trained to the trade is most likely to produce satisfactory work, if stick and rag can be so-called. 6th—Task work in the concrete will infallibly lead to this, and if employers are dissatisfied with the result of their own arrangement, why not cease snarling, and co-operate with the wealth producer; well-managed, his capabilities may be fully and fruitfully developed.

G. E.

TOPICAL NOTES.

These notes will be a regular feature of future issues. The innovation has been called for by the need of fuller comment on matters of professional and topical interest than is made in our "Architectural Causeurie" columns. "Topical Notes," we think, will add an interesting page to "The Builders' Journal."

The Reigate Competition.

WE publish to-day, the report of our Special Correspondent on the result of the competition for the proposed municipal buildings at Reigate. The buildings in question comprise municipal offices and fire and police stations, and the cost is not to exceed £15,000, but the site is unpopular with the majority of the ratepayers, and it is unlikely that the designs secured will ever be executed. It will be remembered that we called attention to the monstrous unfairness of the conditions of this competition (published in this journal on September 7th), and to the presumption of the Town Council who framed them in such terms. The premiums were in no just proportion to the value of the work, and considerably below those which are usually offered in competitions of the importance of this one, but, in spite of this, it was stipulated that the three premiated designs should remain the absolute property of the Corporation; no promise was given that the successful or any competitor should be commissioned to direct the work, and it was expressly stated that the "assessors" reserved to themselves the right to alter any of the designs as they might deem advisable, and to withhold one or more of the premiums in the event of only a few designs being submitted, or if in their opinion the prizes were not merited. The "assessors" are, it seems, a Committee of the council, for the instructions to competitors began: "Each drawing shall consist of—(a) a general section, (b) a general elevation," and so forth. A reference to our correspondent's report will show that the result of the competition has fulfilled the promise of its inception. It was only to be expected that the award of the "assessors" would indicate the bias of a local and personal preference, and this seems to have duly occurred. This is hardly creditable on the part of the Reigate Town Council, although under the terms of the conditions, and as a strict matter of business, they were entitled to make any selection they might choose, but it seems to us that in this matter the gravest discredit lies with the Profession. At the time the conditions of competition were first made public, a correspondent to this journal wrote with great justice and pertinence when he said: "I consider that any architect sending in a design under such conditions is giving his vote and influence to the degradation of himself and his professional brethren." As we have pointed out on several occasions, the abuses of the competition system and the disrepute into which the Profession has fallen through this humiliating usage by the public, is not so much the fault of the promoters who, as business men, are entitled to ask as much as they can get for their outlay, but is rather due to the lack of public spirit, *esprit de corps*, and professional dignity among the architects themselves. This instance of the Reigate Competition is a case in point. The conditions drew forth wide ridicule, and the universal condemnation and repudiation of the Profession, and yet, although the exact number is not stated, the circumstances indicate at least a fairly large number of competitors. We heard a little time ago that some one had delivered a lecture on "Professional Etiquette." We do not think that lecture was a very long one.

OUR readers will have been sorry to learn that it has been deemed necessary to reconstruct the fine bridge at Kew to meet the needs of increased traffic, and we now regret to hear that the sum estimated by the engineer of the London County Council, Sir J. Wolfe Barry, and granted by Parliament for the work, is much below the price named severally in the tenders, and that it has been suggested that the design should be modified, and a reduction of cost effected by the substitution of internal brickwork or concrete in place of stone. This is a principle of economy that is met with all too frequently in these days, and it is indeed a pity that the successor to old Kew Bridge should be the object of official parsimony. We notice that Sir J. Wolfe Barry attributed the heavy prices quoted in the seven tenders to the new Employers' Liability Act, and the attitude taken by the London County Council on the subject of terms of labour. We rather expected that he would have burst out into animadversions on the "conspired indolence and brutish callousness of the bricklayers and plasterers," or used language to some such effect.

WE are glad to see that it is intended that the work of building the nave of Mr. Pearson's masterpiece shall begin next year. £27,000 have already been subscribed for this work, and it is hoped that the fact of building operations being renewed will call attention to the work, and increase the flow into the exchequer. Truro Cathedral will hold a unique position in posterity. As it will be the largest achievement of the Gothic Revival, so it will be also the last, for the whole tendency of church building at the present time is opposed to the principles of the Revivalists. It is well that this should be so, for, sincere as the enthusiasm of these men was, their's was an ideal which cramped and falsified the true impulse and privilege of Art.

THE London County Council has, under its new General Powers Bill, just availed itself of the highest prerogative of its institution, and has voted £1000 to the completion and erection of the late Mr. Thomas Thornycroft's statue on the Embankment by Westminster Bridge. Under the advice of Mr. T. G. Jackson, R.A., the site upon which the plaster model now stands has been approved, but the pedestal is to be some 5ft. higher than that upon which the model now set. To our mind the group would have looked better in a position in which it might be seen readily against the sky, and at such a distance as to emphasise its full value as an Architectural Sculpture, an object it was avowedly designed to effect, and which it effects, we think, almost to the exclusion of all appeals to the æsthetic sense.

CAMP VIEW.

WE illustrate on our front page an addition to a house at Wimbledon. The house is built of brick and slate. Lawrence's red bricks are used for facing, the slates are Tilberthwaite's, and brown Portland stone is used for the dressings and parapets. The architects are Messrs. John Richmond and Walter E. Hewitt.

THE training classes held by the Home Arts and Industries Association for voluntary teachers and others at the Royal Albert Hall have now opened for the autumn session. Bookbinding and leather embossing, carpentry and carving, inlay and marquetry, metal repoussé and basket-making, &c., are taught. Particulars can be obtained from the Secretary.

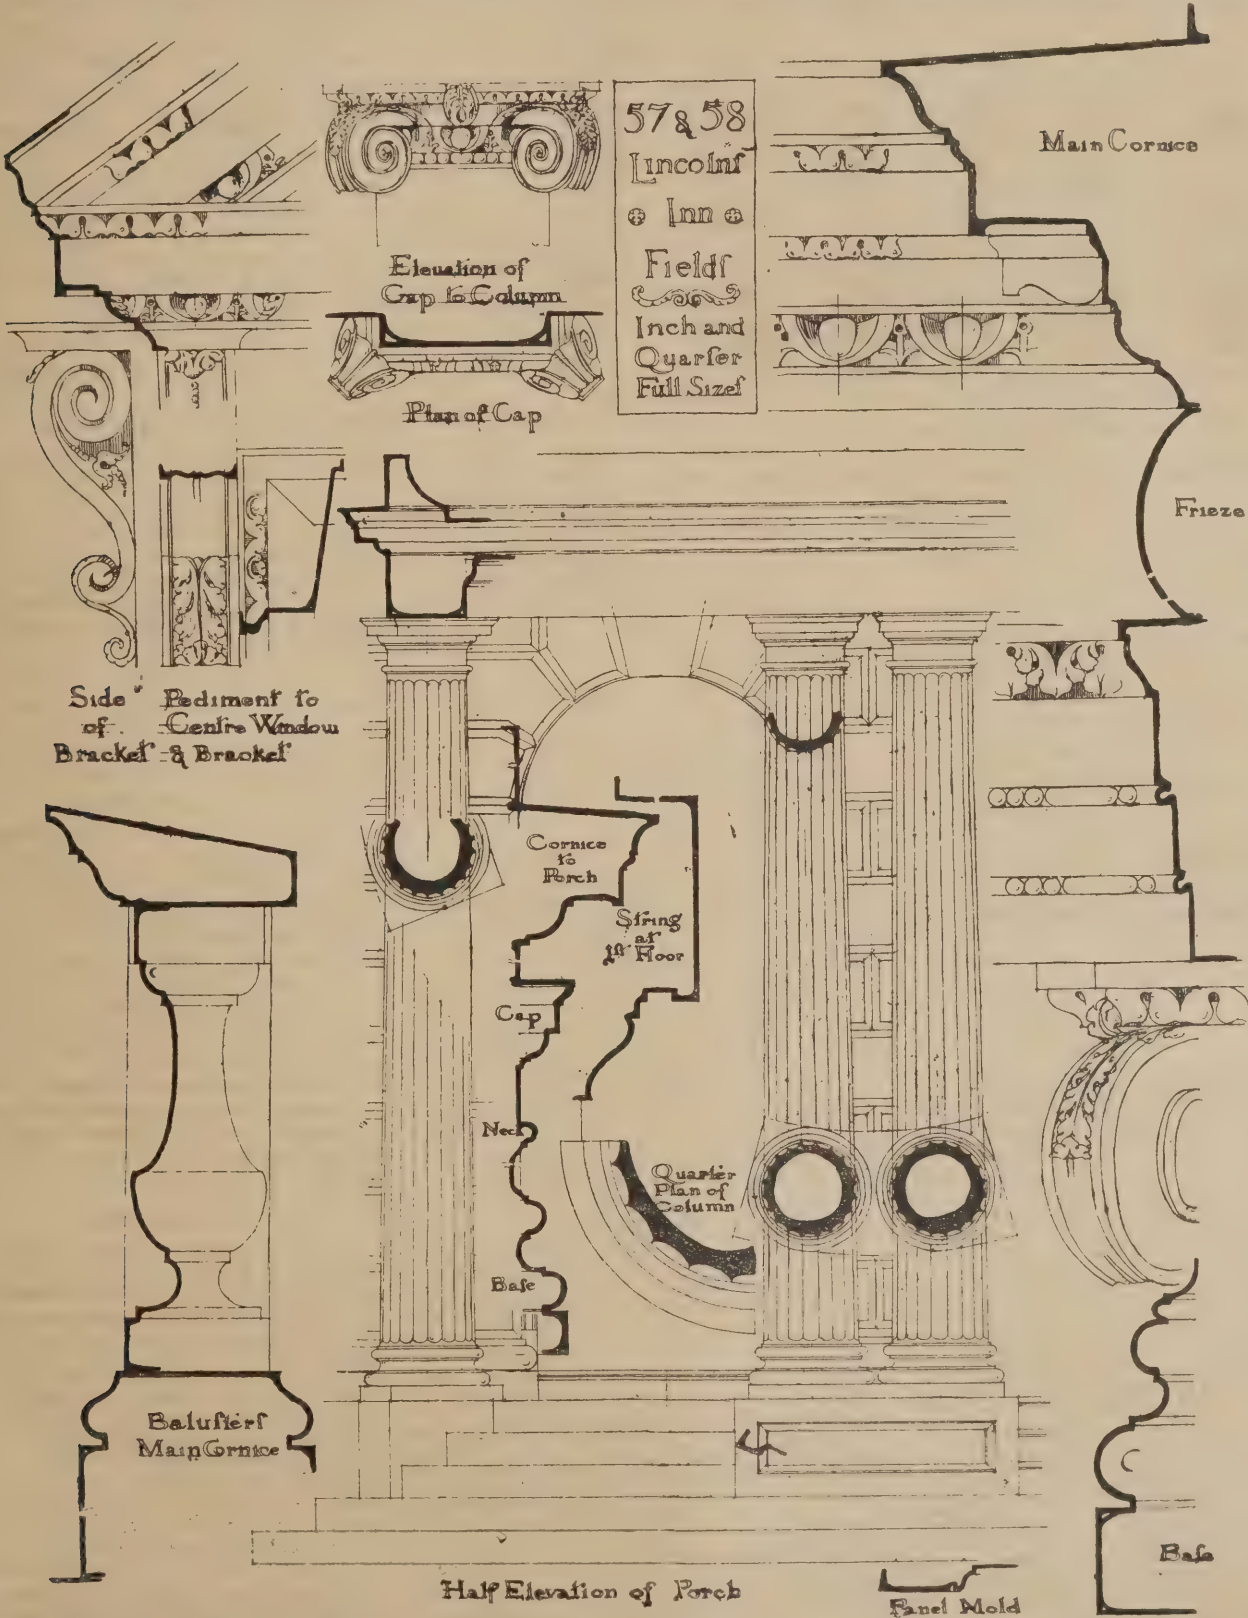

THE A.A. MEASURED DRAWING AWARDS.

BY OUR OWN CRITIC.

THE sheets of drawings submitted in competition for the Architectural Association Measured Drawing Prize in no degree approach in merit the work which was produced by candidates for the A.A. Medal, whose designs we have fully reviewed. Five alternative subjects were given in the instructions to intending competitors, comprising:—The Pedestal and Statue of Charles I. at Charing Cross; St. James' Club, corner of Bride Street, Piccadilly; the organ, St.

Lawrence, Jewry; the chimney-piece at The Charterhouse; and Nos. 57 and 58, Lincoln's Inn Fields, a design attributed to Inigo Jones. Of these the two latter proved themselves the most popular, and the prize, as we announced some weeks back, has been given to Mr. A. M. Torrance for his measured drawings of the Lincoln's Inn Fields House, while Mr. J. G. N. Clift has won Honorable Mention with his drawing of The Charterhouse chimney-piece. We publish both these drawings, necessarily much reduced in size, in our present issue. They show accurate and careful work, but little or no distinction of manner, and lack that precision and vigour which should always characterise a good architectural drawing. Mr. Torrance's measured notes showed a neat and well plotted elevation, but in making his final drawing he would have been better

advised to have used a heavier line, and he has tried to show more of the detail in the decorated parts of the design than could possibly be fully indicated in a 1/2 in. scale drawing of his subject. The power that enables an experienced draughtsman to make a good small-scale drawing relies as much upon his knowing what to leave out as in his knowing how to draw what he puts in. In an architectural drawing, as we see from the work of the present acknowledged masters of the art, the line should not vary appreciably in width or density throughout, and it is the sign by which we know an inexperienced draughtsman when we see the more intricate parts of the drawing delineated in a thinner line, or treated in a different manner, to the remainder. In places, Mr. Torrance's line shows the widening

57 & 58, Lincoln's Inn Fields, W.C. 6
Quarter-Inch Scale Drawing

Inigo Jones' Archt.
circa 1630

A.A. MEASURED DRAWING PRIZE. ELEVATION OF 57 AND 58, LINCOLN'S INN FIELDS.
FIRST PRIZE. BY A. M. TORRANCE.

and shrinking touch of his steel nib; the best draughtsmen do not allow this to appear, and their freehand line has a free equal contour, as though it had been traced with a stylo. It is a good plan to rub the point of the nib lightly on an oilstone till a line of the right gauge can be drawn without pressing upon the pen, or appreciably opening the cleft of the nib.

These latter remarks apply also to Mr. Clift's subject, which, though easier to measure and involving somewhat less drawing, has called for a good deal of freehand drawing of a difficult order. Mr. Clift's drawing in particular is marred by the flexible point of the steel pen he used, with which it is almost impossible to draw a long sharply curving stroke in a satisfactory way, as the thickness of the line will always vary with the direction in which the point of the nib is moving. Next time Mr. Clift has any such work to be finished let him blunt the point of his pen as above described, or use some other expedient to a similar end, and trace over his pencil lines with a free wrist and the pen held loosely and lightly in his fingers. His manner of drawing the grotesque, masks, and heraldic figures is also not very good. He has put too much work into them, and nervously touched them up and shaded them so that they look as though they were alive, and some of the lions' heads appear like human faces in pain. Such things as these are among the most difficult to draw in line so that their character be presented, and the material in which they are carved well suggested, but the broad, equal, flowing line, which should distinguish the rest of the drawing, will also be best used here.

There is another point upon which we would

call both these gentlemen to order, namely, upon the subject of their printing. The labour, pains, and thought expended upon it are indeed most praiseworthy, and, in the case of the prize-winner, it has been given as much attention as the drawing itself, for it has been enriched with scrolls and crossed palm branches, more voluptuous than anything in Inigo Jones's design. But why set so much store by an acquirement which, as here practised at least, is a mere feat of mechanical dexterity? It will be found that men of the most distinguished merits in Architecture do not elaborate their printing in this way. The point typifies very aptly the modern misconception of the significance of good draughtsmanship, wherein a high value is ascribed to mere manual facility, a facility which in general, indicates a mechanical and uncreative mind. The drawing of architects should be dashing, broad, sketchy, and suggestive, without deviating from the architectural demand for strict accuracy. We have wondered also why Mr. Torrance, having all the languages of the world to choose from, and any cypher or combination of words or signs he could remember or invent, for the motto which should distinguish and identify his design, selected a word which was invented to popularise a hair renovator, and has been elevated to the catchphrase of a music-hall song. We remember the same irrelevant spirit in a competitor at the R.I.B.A., who, some years ago, called his Soane design "Charley's Aunt!" This sort of thing is frivolous and unbecoming, to say the least, and might justly have prejudiced the assessors, and turned the balance of their decision against "Tatcho."

RIEVAULX ABBEY.

THIS Abbey (called Rivas by the natives) is some twenty miles beyond York as the crow flies, in the North Riding of Yorkshire. Bolton Abbey, in Wharfedale, has always appeared to me (says a writer in the Manchester Weekly Times) to be peerless for situation and perfect in all the features which go to make up a picture—wood, water, and bounding fells for background. I would unhesitatingly place Rievaulx Abbey next in point of beauty and interest. In several features this abbey surpasses Bolton Priory. It is more extensive and of more imposing and beautiful Architecture. Leaving Leeds by the North-Eastern Railway train, we soon quit the smoke and grime of this prosperous northern city for Helmsley. This little rural town of about 1500 inhabitants has much that is quaint about it. Its great market square or place is entered by three roads. In the centre stands a handsome stone monument of beautiful design, a Gothic shrine enclosing a full length marble figure of the present Earl Feversham's father, erected some thirty years ago. The church, the most imposing of the Ryedale churches, is a neat structure, carefully restored in the sixties. There are many antiquities in and around it.

THE CASTLE RUINS,

upon a wooded knoll, have a very imposing appearance, and are intensely interesting to the antiquary. They carry us back to the Norman times. The keep of solid and good quarried stone is very impressive. Its most notable owner was a Walter L'Espee, who fought successfully in the Battle of the Standard. It was this warrior knight who built and endowed Rievaulx Abbey in 1131. He afterwards became its Abbot. Helmsley Castle was built by one De Ros whilst Yorkshire still wept the Norman Conquest. Helmsley has a few ancient houses covered with thatch, though the majority are covered with red fluted tiles. A stream runs through its main street. There are a market cross and several old comfortable inns in the square. Two miles from Helmsley we find a wicket gate by the side of the road, with notice board indicating the way to the Abbey and

THE TERRACE.

We visit the famous terrace, a piece of exquisite lawn, over half a mile in length, forming an irregular curve. Through openings we obtain, as we slowly proceed, charming glimpses of the Abbey seated in the vale below. At either end of this noble terrace, which art has skillfully fashioned from a natural mound, is placed a Greek pavilion and a Tuscan temple. The latter contains some magnificent mural frescoes, painted by a distinguished Italian, representative of the salient features of Greek mythology. On the coved ceiling is depicted, in all the wealth of colour and wonderful realism, Apollo as sun god in his chariot drawn by three fiery chargers. Aurora, the Goddess of the Morning, is opening the aerial portals of the dawn. The first view we get of

THE ABBEY

is not soon to be forgotten. There below the steep declivity, embosomed by wooded hills, stands the ruin, lovely and beautiful in its desolation. Its name indicates its position, viz., the Abbey of the Rye Valley (Valle, Vaulx, or Vaux). From one point of view we see the choir, which is entire, being one of the most perfect parts of this interesting ruin. It is of light colour, almost gleaming white in the brilliant sunshine; and we are astounded as we try to realise what must have been the magnificence of the whole pile in its prime. Other portions come into view as we proceed, and soon we see the hamlets, the thatched and tiled "huts where poor men lie," scattered in delightful irregularity. We leave the terrace by zigzag paths into the dell below, and winding amongst the few scattered houses we reach the ruins, amidst whose columns and broken arches we wander long and leisurely. Seated on a

broken fragment within the great enclosure, at a point where the transept intersected the nave (now vanished!), we gaze admiringly up the choir,

WITH ITS MAGNIFICENT WINDOW of three long lancet compartments, below which are three others of similar form. Through these six openings is seen the wooded slope of the terrace. Below, railed off around, near where the altar once blazed in gold and precious stones, is an abbot's tomb. On each side are rows of magnificent clustered pillars, richly capitolled, fresh as from the mason's chisel. Above these are two tiers of simple arched windows, with lovely columns at each side. Singular to say, this building points north and south. It is in the Norman and Early English style of Architecture. The monks who occupied it were of the Cistercian order, and it is the first abbey erected in Yorkshire, and the second in England. We must not forget the refectory, the whole of whose walls are still standing. The stone recessed lectern in the hall where the reading brother sat during meals still remains. What was once the cloister court is now grassy paddock, shaded by noble ash trees. In this ruin,

SO LOVELY IN DECAY, we see an eloquent link between the present and the past. Over seven centuries have rolled down the stream of time since the era of strong religious fervour which marked the twelfth century—the age of Peter the Hermit and of many a saintly character. It was an age which saw the building of stately abbeys, and the transforming of many a sterile vale into fertility and plenty. Above all, it was the age which gave birth, in the sunny clime of Southern France, to Barnard of Clairvaux. Bernard sent a small body of his monks to this district. They found this part of Yorkshire a vast howling wilderness. Their beneficent labours transformed it into a paradise. Rievaulx Abbey is one of the 160 which he founded.

ST. MARY'S CHURCH, Woodbridge, has lately been beautified by the presentation of two excellent stained-glass windows.

BRITISH ARCHÆOLOGISTS IN GREECE.

AT the annual meeting of the subscribers to the British School (of Archæology) at Athens, Mr. Hogarth, Fellow of Magdalene College, Oxford, the director, stated in his report that the functions of the school were twofold—education and research. The first divided itself into education in aesthetics and education for research. Neither in his view was a primary object of the school, the first being really not archæology, though often mis-called so. The second ought to be well-nigh completed before students come to Athens at all—at the Universities and English museums. As a matter of fact, the functions of the school were limited—first by its small staff. If the British School was to be a teaching institution it must provide itself with such an organisation as the German School had. It should also be remembered that few men could afford such a luxury. The supply of such students would always be small. The second function—research—was the one which both in theory and practice, the school performed best. In fact, last year a majority of the students represented this side. The research might be—(a) Individual, for which the school provides trained advice, a library, and all possible facilities; but the researchers, mostly graduates of full age, took their salvation in their own hands. Again, their numbers could never be large owing to want of endowment for long terms of residence abroad—English students not being supported by their Government—and to want of endowments at home, professorial chairs, museum places and the like. The school had only a very small and uncertain nucleus of men working at archæology as a profession. On the increase of this would depend

ITS INTERNATIONAL REPUTATION.

(b) Collective, undertaken by the school as such. This was principally by excavation.

The scene of action during the past season had been the most important pre-historic capital of the island of Melos, discovered at Phylakopi, on the north-east coast, by Ross, and reported on by Dummier. The school began to excavate it in 1896, little suspecting its great importance. It was proving a second Hissarlik, an undisturbed repository of the products of the primitive civilisation of the Ægean from the "Mycenaean" age back to the Neolithic period. Much has been eaten away by the sea, but what was left was equal in extent to Tiryns. Mr. Hogarth picked up the work where Mr. Cecil Smith left it, and, after determining the limits of the city on south and east, and digging test trenches to obtain a relative chronology of the potsherds, in which the site was marvellously rich, proceeded to open out the great barrack-like structures on the north and west. Here were

REMAINS OF THREE SETTLEMENTS,

divided by layers of débris, the middle and lower ones being singularly well preserved. The best rooms were on the higher ground to the west. The blocks were divided by narrow lanes with covered drains down the centre. The depth varied from seven metres to three metres. In the two lower settlements was found a mass of pottery, and almost as many vessels, complete or little broken, as in a large cemetery. These covered the whole development of the potter's art up to the fine Mycenaean work. Fabrics, shapes, and decorations were in many cases new. The most notable vase was pipe-shaped and decorated with four scantily-clad figures, bearing fish in either hand. This was about the most interesting primitive Ægean vase in existence. In several rooms painted frescoes were found, in one case white and gold lilies on a red ground; in another a beautiful scene of the sea with flying fish and marine growths and a man working a casting net. Of the primitive symbols now attracting so much attention on Cretan stones, &c., over fifty distinct examples were found scratched in clay before baking. Many fine steatite vases, clay lamps (unknown previously on early sites), and other stone utensils and implements came to light. There was a little bronze and bone, but no gold or silver.

HON. MENTION. BY J. G. N. CLIFT.

NEW PUBLIC BUILDINGS FOR REIGATE.

A COMPETITION, AND A COMPLAINT.

BY A SPECIAL CORRESPONDENT.

THE designs were delivered on Thursday, October 6th, and on the following Tuesday the designs placed first, second, and third were publicly exhibited, but no intimation of the exhibition was given to the competitors—at least to the unsuccessful competitors. Exception must be taken to the exhibiting of the winning designs only. The great value of a public exhibition is that it allows the public and the competitors to see that everything is above board, and in the case of this competition it is obviously impossible to know if the best designs have been chosen.

With regard to the three designs that were exhibited, it would seem that the design placed third had secured its position through some curious mischance, as in every way—in planning, design, and draughtmanship—it is an indifferent piece of work. The first premiated design, under motto "Pro bono publico," is by Messrs. Balham, Limited, and is shown by drawings executed in black-and-white, cut out and mounted on grey-tinted cards. In this design both the police superintendent's residence and the fire-station are detached buildings, the former being so required by the conditions of competition. The main block of buildings, containing public offices, council chamber, police court, and offices are placed facing the proposed new roadway, with one principal entrance to the whole. The building is narrow and very elongated, this necessitating long corridors.

The second premiated design, "Efficiency

with Economy," is by Mr. Arnold B. Mitchell, and is admirably shown by a spirited perspective, the design being well thought out; and, as in the first premiated design, the police superintendent's residence and the fire-station are distinct from the main block. The plans are more compact than in the first premiated.

The third premiated design needs little or no description, save that it is by an assistant in the Reigate Borough Surveyor's Office, and was sent in under the motto of "Labor Omnia Vincit."

One more word. The way the competitors have been treated leaves something to be desired. The unsuccessful designs have not, at the time of writing, been returned; and not a line of information has been sent out as to how or by whom the award has been given.

THE freehold of the Manchester Hotel, along with a number of shops in Aldersgate Street, was submitted for sale at the Mart, Tokenhouse Yard, last week. The bidding started at £100,000, and rose to £163,000, when the property was "bought in" for £175,000.

The past week has been one of great activity at the Tokenhouse Yard Mart, and almost every investment offered was disposed of, in some cases keen competition being displayed. Ground rents were in active demand. A number of these secured upon property at Blackheath realised very high prices, as much as 96 years' purchase being paid in one case, and the total amount of the sale reached nearly £69,000. In the way of land the only transaction was in regard to some 14 acres on the Greenwich marshes, which realised about £500 an acre. The total returns for the week amounted to £185,521.

MARTELLO TOWERS.

ONE of the old Martello towers which form such picturesquely conspicuous objects on the East Coast, right away from the mouth of the Thames down to Aldeburgh, is in process of demolition. Many of these curious fortifications have been destroyed already. In the books of reference which contain any allusion to the subject at all, they are described as obsolete and unserviceable for purposes of national defence, and that fact was indeed recognised long ago by the War Office authorities, when the forts were dismantled and allowed to be put to all manner of strange uses. Some were taken down, as already stated, and it is said that a single structure provided sufficient material

FOR THE BUILDING OF SIXTEEN COTTAGES;

the larger number were for a long time occupied by coastguardsmen; and one tower has been converted into a Catholic Chapel. The question arises whether those towers are not historical relics well worthy of preservation. The Martello towers were built in the early years of the present century, when Bonaparte was making preparations for the invasion of England. In some topographical work, a sarcastic statement appears to the effect that these extraordinary buildings must have been put up as a puzzle to succeeding generations, the inference being that no sensible or acknowledged plan of defensive fortification was followed in their erection. But this was not by any means the case. In Dr. Brewer's "Dictionary of Phrase and Fable," the explanation is given that circular towers of a like character were placed all along the Mediterranean Coast as a means of protection against pirates, and that the name they received arose from the method of sounding an alarm, by striking a bell with a "martello" or hammer. The tower under notice stands

IN THE VILLAGE OF BAWDSEY

and is one—the advance guard, as it were—of a group of five which were intended for the protection of Hollesley Bay. It is apparently for the sake of the bricks, which are employed for the "inside" work of some new cottages for coastguardsmen, that the old Martello tower is being pulled down; and they must be very dear bricks, for the labour and trouble of the process is something prodigious. The walls are about 16ft. thick at the bottom, and 10ft. thick at the solitary entrance door; there is an immense central pillar, upon which and the outside wall a heavy vaulted roof is supported, and the men have up to the present gone little beyond throwing down the stone parapet and peeling off some of the external surface. To do this deep holes of about 2in. in diameter are drilled in; a foot of the space is crammed with gunpowder; and the charge is exploded by means of a fuse. The materials of which the walls are made is

A KIND OF KENTISH BRICK,

all bound together with cement between the inside and outside facings. Apart from any historic interest, the tower is a remarkable structure—exactly like all the rest, it may be said, except that there is no fosse or ditch around it, as is the case with that example which stands on the hill near the Bath Hotel at Felixstowe. The one entrance is at a considerable height; it is very narrow, and is closed by a heavy door, with an iron bar fitting into staples. It leads to a single circular apartment, lighted by two small windows, having an outlook towards the sea. This was used as a casement for troops, and would have been a safe place of refuge in olden times, when the largest guns were but toys in comparisons with the inventions of to-day.

THE Bristol Municipal Sites Committee are considering the question of a site for new municipal buildings.

A VERY curious relic of old Paris is about to be removed—the house in the Rue de Venise, built in 1402 by the celebrated alchemist, palmist, and philanthropist, Nicholas Flamel.

A LEEDS BUILDING SCHEME.

THE aspect of Briggate, the principal thoroughfare of Leeds, is about to be improved. The old commercial hotel, the Bull and Mouth, and some adjoining property, has been acquired by a private company. This company is about to develop the estate, which covers an area of 4900 square yards, and which includes not only the Bull and Mouth Hotel, but two shops on the north and one on the south side of it. To Briggate there will be a frontage of 120ft., and to Kirkgate one of 121ft. Backward from Briggate, the estate extends to within 40ft. of New Market Street. The buildings upon the ground are very old, and at the rear consist of dilapidated cottages and sheds. The whole is to be swept away, and entirely new buildings erected. The promoters hope that in carrying out the scheme the Corporation will see their way

TO MAKE A NEW STREET

from Duncan Street to Kirkgate, 42ft. wide—a continuation of the recently constructed thoroughfare known as Central Road. For this purpose no less than 1900yds. of the ground is offered by the Company, and negotiations with a sub-committee are now going on. Plans of the new structures have already been prepared, and it is evident that the Company are going to carry out the enterprise on a palatial scale. Briefly stated, the new buildings will comprise a large hotel, an immense emporium, and a large number of shops and warehouses. The Briggate frontage will be in the French Renaissance style of Architecture, and rise six stories. The principal ornamental features will include a number of richly decorated circular columns. Marble and granite will be extensively used. It is said, indeed, that there will be no more imposing structure in Briggate, and it will be surmounted by a handsome turret, with illuminated clock, 120ft. high from the street level. The main entrance to the hotel will, of course, be in Briggate. It will be approached through a colonnade 75ft. long and 20ft. wide. This will lead directly to a large central hall, 94ft. long and 30ft. wide, with a balcony running round the first floor level and a handsome lantern roof. The hall is to be elaborately treated, and will probably surpass in elegance and dimensions anything of the kind in the provinces. Access to all parts of the hotel will be had from it. On the ground floor will be a buffet, 75ft. by 25ft. A ball-room, 90ft. long by 45ft. wide, and 25ft. high, will have a beautiful oriel window, overlooking Briggate. In the basement will be situated a billiard saloon. The public bedrooms will number 130.

THE EMPORIUM,

which has already been let on lease for twenty-one years, likewise forms a very extensive part of the enterprise. It will have a frontage to Briggate of 74ft., an area of 95ft. by 75ft., and a large lantern roof. Four or five tiers of galleries will run round the interior. The basement will be constructed so that it can be flooded to a depth of 2ft. The establishment will be on the lines of Lewis's emporium in Liverpool. A promenade will overlook Briggate. For the entertainment of customers a fine band will perform during business hours, and light refreshments will be served. The emporium will be the enterprise of a Company. The new shops and warehouses are to number twenty-one. Each will have a frontage of about 18ft. At the rear the old Red Lion Hotel, now approached from Kirkgate, will be rebuilt. It is expected that the carrying out of the scheme will occupy about three years. The architects are Messrs. J. Holmes, Greaves, and Co., of London, Leeds, Pontefract, and Castleford.

SOME time ago the London County Council agreed conditionally to lease a site at the southern approach to the Tower Bridge for the erection of a theatre. The Corporate Property Committee of the Council, however, now report that the conditions of the Council have not been complied with, and recommend that the resolution be rescinded.

THE FEUDAL PRINCIPLES OF REAL PROPERTY LAW.*

BY WILLIAM H. STACPOOLE, LL.D.,
Barrister-at-Law.

II.

IN the contemplation of our law, all the land in the Kingdom is held, mediately or immediately, of the Sovereign. The thing holden is, therefore, styled a tenement, the possessors thereof tenants, and the manner of their possession a tenure.† The feudal principle of this will appear from what I have said in the last article.

There were, among our ancestors, four principal species of lay tenures, to which all others may be reduced; the grand criteria of which were the natures of the several services or renders, that were due to the lords from their tenants. The services, in respect of their quality, were either free or base services, in respect of their quantity and the time of exacting them, were either certain or uncertain.†

From the various combinations of these services have arisen the four kinds of lay tenure which subsisted in England till the middle of the seventeenth century; and three of which subsist to this day.† They were:

1. Knights' service; where the service was both free and uncertain.
2. Free socage; where the service was both free and certain.
3. Pure villenage; where the service was base in its nature, and uncertain as to time and quantity.
4. Villein-socage; where the service, though base, was reduced to a certainty.

* Continued from page 75.
† 2 Bl. Com. Ch. 5.

Until the restoration of the monarchy in 1660, most of the land in England was held by the tenure of knight's service, and that principally of the King *in capite*, or directly from the King. There were instances in which the tenant in knight's service held from a middle lord, who, again, held mediately or immediately from the King. Cases of this kind were examples of what is called "subinfeudation." But any such estates must have been created before the eighteenth year of Edward I., when a celebrated statute, called, from its opening words, the statute of *Quia Emptores*, was passed to put an end to subinfeudation, or the fresh creation of the relation of feudal landlord and tenant. Of this I shall have more to say presently, when we consider the nature of an estate in fee simple.

The tenure of knight's service was abolished, or rather it was changed into free and common socage, by the 12 Car. 2, chap. 24, passed in the year 1660. We must not, however, suppose that the principles of the feudal system were abolished by this Act, which touched, not the system itself, but only certain incidents that arose from it. Socage, into which all tenures (with certain trifling exceptions, to be noted presently) were converted by the Act, is itself a feudal tenure, and, before we proceed to consider its nature, it will be well to glance briefly at the more ancient and purely feudal tenure of knight's service, "since," says Blackstone, "it is that alone to which we can recur, to explain any seeming or real difficulties that may arise in our present mode of tenure."*

To make a tenure by knight's service, a determinate quantity of land was necessary, which was called a knight's fee, the value of

* 2 Bl. Com. Ch. 6.

A.A. MEASURED DRAWING PRIZE. CHIMNEYPIECE AT THE CHARTERHOUSE.
HON. MENTION. BY J. G. N. CLIFT.

which, in the reigns of Henry II. and Edward II. was £20 per annum.* A certain number of these knight's fees made up a barony. The tenure was transferred by livery of seisin, which means delivery of the feudal possession (and which I shall explain more particularly when describing the conveyance of real estate) and was perfected by homage and fealty.

Fealty was a profession of faith to the lord, which corresponded to the more modern oath of allegiance. Homage was a ceremony that was performed by the new tenant in the presence of the old tenants upon his investiture. It is thus described by Blackstone:—"The vassal or tenant upon investiture did usually homage to his lord; openly and humbly kneeling, being ungirt, uncovered, and holding up his hands both together, between those of the lord, who sat before him; and there protested that 'he did become his man, from that day forth, of life and limb and earthly honour,' and then he received a kiss from his lord, which ceremony was denominated *homagium*, or manhood, by the feudists, from the stated form of words, *devenio vester homo*." Homage was abolished by 12 Car. ii., ch. 24.

The seven principal consequences of the tenure by knight's service, or in chivalry, were as follows:—

1. Aids. — These were originally mere benevolences granted by the tenant to his lord in times of difficulty, which, however, came in process of time to be considered as matter of right, and not of discretion. They were chiefly three—first to ransom the lord's person if taken prisoner, an obvious consequence of the feudal relation between them. Secondly, to defray the expense of making the lord's eldest son a knight, so as to provide for the better defence of the nation. Thirdly, to give a suitable portion to the lord's eldest daughter. The feudal principle of this was that the lord could not acquire money by other means, being for the benefit of the nation wholly conversant with matters of arms, and from the nature of his tenure unable to charge his lands with this or any other incumbrances.†

2. Relief. Originally, as we saw in the last article, the feudal tenant only held his estate for his own life, that is to say, during the time that he was able to perform the services in consideration of which he held it. Gradually it became customary to appoint the eldest son to succeed the father, because, having been trained by the father, he seemed to be the person who on the decease of the father would be most likely to properly perform his duties. Relief was a fine (of one year's rent where the rent was fixed) which the heir paid to the lord for admitting him to the feudal tenure which his ancestor had possessed. But it was only payable if he were of age on the death of the ancestor, for if under age he became liable to "wardship" and "marriage."

3. Primer seisin was the relief paid by the heirs of the King's tenants *in capite* if of age at the death of the ancestor. It amounted to one whole year's profits of the lands if they were in immediate possession, and half a year's profits if they were in reversion, expectant on an estate for life.

4. Wardship. If the heir were under twenty-one years being a male, or fourteen being a female, when the ancestor died, the lord had the custody of the body and lands of such heir, without any account of the profits, till the age of twenty-one in males, and sixteen in females. The law supposed the male to be unable to perform knight's service till twenty-one, but the female was supposed to be able to marry at fourteen, and then her husband could perform it. If she were fourteen on the death of the ancestor, the lord had no wardship, but if he once got her into wardship, owing to her being under fourteen, he could keep her in wardship till sixteen. The feudal principle of wardship was to give the custody of the feud to the lord, that he might, out of the profits arising from

the land, provide a fit person to supply the infant's services, till he was of age to perform them himself.

When the male heir reached the age of twenty-one, or the female sixteen, they might sue out their livery, or ousterlemain, as it was called; this meant sue for the delivery of their lands out of their guardian's hands. For this, they had to pay a fine of half a year's profits of the lands, but, as I have intimated, in consideration of the land having been in ward, they were excused relief or primer seisin. It was to deal with questions of this kind that the celebrated Court of Wards and Liveries was instituted by Henry VIII., in the thirty-second year of his reign.

If the heir held a knight's fee, he had, on coming of age, to receive the order of knighthood, or pay a fine to the King. Edward VI. and Elizabeth are particular instances of sovereigns who exercised the royal prerogative of compelling the vassals to be knighted (a matter of great ceremony and expense) or pay a fine, as a means of raising money. It caused great dissatisfaction when attempted to be enforced by Charles I., and was abolished by a statute passed in his reign, 16 Car. i., ch. 20.

5. Marriage. While the infant was in ward, the guardian had the power of tendering him or her a suitable match, without *disparagement*, or inequality; which, if the infants refused, they forfeited the value of the marriage, *valorem maritagii*, to their guardian; that is, so much as a jury would assess, or anyone would *bona fide* give to the guardian for such an alliance: and if the infants married themselves without the guardians' consent, they forfeited double the value, *duplicem valorem maritagii*.** This right of selling the ward in marriage, or receiving the value of it, which was expressly declared by the statute of Merton (20 Hen., 3, c. 6), seems to have been one of the greatest hardships of the tenure by knight's service.

6. Fines for alienation were paid to the lord when the tenant made over his lands to another person. This depended, like relief, on the nature of the feudal connection between the lord and his tenant, by which they were reciprocally bound to each other, so that neither side could alienate without the other's consent. Therestrain, however, wore away more quickly in the case of the lord than in the case of the tenant, and even in the case of tenants, fines for alienation were only exacted from the King's tenants *in capite*, at least since *Magna Carta*, and *Quia Emptores* (18 Edw. I., Ch. I.).

7. Escheat. Where the mutual bond between the lord and the tenant was dissolved, either because the tenant died without leaving heirs of his blood, or because by the commission of some atrocious crime his blood was considered to be so corrupted that every inheritable quality was blotted out of it, the land was said to escheat, or fall back, to the lord. The feudal reason of this was that the tenant was construed to hold of the lord on the implied condition that he would not be a traitor or a felon.

"These," says Blackstone, "were the principal consequences of the tenure by knights' service: a tenure by which the greater part of the lands in this kingdom were holden, and that principally of the King *in capite*, till the middle of the seventeenth century; and which was created, as Sir Edward Coke expressly testifies, for a military purpose; viz., for defence of the realm by the King's own principal subjects, which was judged to be much better than to trust to hirelings or foreigners."

The grand point to notice about these consequences of the tenure by knight service is that, depending as they did upon emergencies, they were necessarily uncertain as to their quantity or duration. Knights' service involved the personal attendance of the tenants, and this becoming troublesome and inconvenient in many respects, the tenants gradually compounded for it by first sending others in their stead, and, at last, by making a pecuniary satisfaction in lieu of it. This pecuniary satisfaction came to be levied by assessments, so much for every knight's fee, from which the tenure was called *escuage* in Norman French, *escuage* being derived from the Latin *scutum*, which was then a well known denomination for money.

"By the degenerating of knights' service, or personal military duty," to quote Blackstone again, "into *escuage*, or pecuniary assessments, all the advantages (either promised or real) of the feudal constitution were destroyed, and nothing but the hardships remained. Instead of forming a national militia, composed of barons, knights, and gentlemen, bound by their interest, their honour, and their oaths, to defend their King and country, the whole of this system of tenures now tended to nothing else but a wretched means of raising money to pay an army of occasional mercenaries. In the meantime, the families of our nobility and gentry groaned under the intolerable burthens, which (in consequence of the fiction adopted after the Conquest) were introduced and laid upon them by the subtlety and finesse of the Norman lawyers."

"For, besides the scutages to which they were assessed by themselves in Parliament, they might be called upon by the King or lord paramount for *aids*, whenever his eldest son was to be knighted or his eldest daughter married; not to forget the ransom of his own person. The heir, on the death of his ancestor, if of full age, was plundered of the first emoluments arising from his inheritance, by way of relief and primer seisin; and, if under age, of the whole of his estate during infancy. And then, as Sir Thomas Smith very feelingly complains, 'when he came to his own after he was out of wardship, his woods decayed, houses fallen down, stock wasted and gone, lands let forth and ploughed to be barren,' to make amends he was yet to pay half a year's profits as a fine for suing out his livery; and also the price or value of his marriage, if he refused such wise as his lord and guardian had bartered for, and imposed upon him; or twice that value if he married another woman. Add to this, the untimely and expensive honour of knighthood, to make his poverty more completely splendid. And when, by these deductions, his fortune was so shattered and ruined that perhaps he was obliged to sell his patrimony, he had not even that poor privilege allowed him, without paying an exorbitant fine for a licence of alienation."*

At last, but not until the first year of the actual reign of Charles II., an Act was passed (12 Car. II., Ch. 24) which enacts "that the court of wards and liveries, and all wardships, liveries, primer seisins, and ousterlemaines, values and forfeitures of marriages, by reason of any tenure of the King or others, be totally taken away. And that all fines for alienations, tenures by homage, knight's service and *escuage*, and also aids for marrying the daughter or knighting the son, and all tenures of the King *in capite*, be likewise taken away. And that all sorts of tenures, held of the King or others, be turned into free and common socage, save only tenures in frankalmoign, copyholds, and the honorary services (without the slavish part) of grand serjeantry."

Of this statute Blackstone declares that it "was a greater acquisition to the civil property of this Kingdom than even *Magna Carta* itself; since that only pruned the luxuriances that had grown out of the military tenures, and thereby preserved them in vigour; but the statute of King Charles extirpated the whole, and demolished both root and branches."

Grand serjeantry was a species of knight's service, only that the tenant, instead of being bound to attend the King generally in his wars, was bound to do some special honorary service to the King in person, as to carry his banner or sword, or be his champion at his coronation. Tenure in frankalmoign is that by which a religious corporation holds lands of the donor to them and their successors for ever. It is distinguished by its immunity from temporal services, even from the obligation to fealty, because the divine service which the corporation renders for its lands is of a higher and more exalted nature than any other. Most of the lands of the Church are held in frankalmoign. Of copyhold, the remaining tenure that was excepted by the Act, I shall speak when we consider the nature of manors.

(To be continued.)

The Advancement of Architecture.*

By PROF. AITCHISON, R.A.

I THINK we may be congratulated on the improvement that is taking place in the appearance of London. It is a great triumph for architects to think that they are converting a rather dull city, mostly composed of brick walls with holes in them, into a town almost as picturesque and varied as the old towns of France or Flanders. I think it was in the forties that Professor Cockerell, at the Royal Academy, gave the approximate number of new churches and public buildings that had been erected in the preceding thirty years; but that list, astonishing as it was, would dwindle into insignificance beside the new buildings that have since been erected in and around London within the same lapse of time. Of very important buildings in the centre of London there have necessarily not been very many, but in the outskirts numberless town halls, technical schools, and other municipal buildings have sprung into existence; and, though I am afraid we can hardly claim for most of them that they have rivalled the picked examples of the world's Architecture, they mostly have some stateliness, picturesqueness, or originality. I regretted to read the remarks of Mr. Norman Shaw, who has been acting as one of the assessors on the designs for the buildings of the Californian University. He said that "The competition had been held in the hopes of

DISCOVERING SOME ARCHITECTURAL GENIUS, but in this it had failed," and he felt "a twinge of national regret when no English name appeared among the selected eleven;" the plans selected were, without exception, of the French school. "Architecture," said Mr. Shaw, "is more thoroughly taught in France than in England; at the same time French teaching destroys individuality." It is a matter for regret that an English-speaking race should have to go to our neighbours for their Architecture, but that may be because there is more architectural genius among our neighbours across the Channel than amongst the English-speaking countries on both sides of the Atlantic and in the Pacific; yet it is peculiarly unpleasant that a celebrated English architect can justly speak of a more thorough teaching being given in France. One naturally asks, Why is this? For one would think that what is teachable could and ought to be as well taught in England, America, and Australia as it is in France; at any rate, the first thing that the English architects should do is to see that this inefficiency is corrected. I can hardly believe that teaching, if not carried far enough to stifle independent thought, can extinguish individuality, for certainly some of our great poets were the best educated men of their day. As far as we know, we cannot give ourselves genius, but it is most probable that, if a large number of persons will acquire that which

A GOOD ARCHITECTURAL EDUCATION can give them, there will be a genius among them; and, surely, a well-taught genius is better than an ill-taught one. There is a most interesting book written by M. Edmond Demolins, who says that the education given to the English has peculiarly fitted them to be successful colonists. Whether this method of education was deliberately chosen, or whether it was stumbled into through the natural bent of the people, does not appear; but we can only hope that, either by accident or design, we may find as successful a method of teaching Architecture; for every English-speaking man in the world must wish that we could produce buildings that would vie with those produced in the most brilliant epochs of Greece and Rome, of France and Italy, and with the best Saracen buildings, and with the Gothic ones that pervaded Europe during the Middle Ages. We cannot hope, however, to equal the excellence of

monuments that sprang into existence after stirring times, in nations where there was an adoration of the beautiful, particularly when one of these nations is believed by some philosophers to have possessed faculties as superior to those of the nations of Europe as the faculties of European nations are superior to those of the negro. Architecture is

THE POETRY OF CONSTRUCTION,

and the noblest poetry, is naturally found in buildings that are applied to the highest transcendental uses. A certain amount of comeliness is necessary to every building, except such buildings as are required to create fear, horror, or a sense of ignominy, such as castles, gaols, gallows, and pillories. A building is an organism created by man for his own needs that should emulate the organisms of Nature. To take man as the highest organism, we may say that the man of the most striking appearance is not a perfect organism if he has some incurable internal defect; and so in a building, no beauty will wholly compensate for its want of answering the purpose for which it was built, and even if it answer its purpose, and has a beauty that is quite incongruous with its use, it becomes as ridiculous in the eyes of judges as a man in a State dress acting as a scavenger. In some of the modern buildings that at first sight affect us strongly, from their size, mass, or ornamentation, if we see that this size and this massiveness are not necessary, that these embellishments are not consistent with the uses of the building, we merely despise the factitious effects. As our knowledge of the strength of materials, of the strains and stresses that result from the different forms of buildings becomes more accurate, it will naturally affect the shapes of the different parts of the building, and I think we must look very much to this for future advancement in Architecture. We want to mark those portions of buildings that have special duties to perform with that architectural emphasis which is given by mouldings, and these mouldings have to produce

THE EFFECT WE WANT IN OUR OWN CLIMATE.

To use mouldings that were designed for climates different from our own, and consequently do not properly answer their purpose, is really to declare ourselves indolent or incompetent; we have plenty of plausible excuses, i.e., that the Romans used the same mouldings whenever they built, and that their Renaissance imitators did the same, and that the archaeologists, our masters, would be shocked at any architect who attempted to think, but neither excuses or bad examples will avail us, if our sole object is to advance our art. We have, too, to consider the purposes to which our buildings are to be put, the ratio of strength we must allow when a building is merely for a temporary purpose, or to last as a record for future ages. According to the uses which the building is to subserve we must consider the ornaments that are to be given to it by the sculptor, and whether their forms are to be taken from vegetable life only, or are to include animals or man. Where buildings are to be used for the highest intellectual or moral ends it is perhaps difficult to find even figure sculpture that will sufficiently express their high use. In classic and mediæval times at least, sculptors employed for this purpose mythical or symbolic figures. In the present day we have almost given up all symbolic and emblematic forms, and have trusted purely to words, which do not strike the multitude, and have not, in the bare form in which they are mostly given, the same effect on the mind as symbolic forms.

SCULPTURE IS WANTED ON ALL BUILDINGS,

but its use should be imperatively called for by the people for all public buildings, for the sculpture, if properly designed, would more completely show the use of the building, and surely the public who pays for these buildings should be informed of their use; and this is particularly called for when the buildings are for benevolent purposes, such as hospitals, asylums, workhouses, rests, refuges, and homes. The speaking arts of sculpture and painting are particularly wanted for enlightening the

people on the advantages of living in a free and advancing country. It is for statesmen to consider how much more contented the population of this country would be if the Fine Arts were used to proclaim the advantages the people enjoyed. The subject of colour is one that has of late years fallen greatly into disuse, but, as far as I can comprehend, very unnecessarily; for as Nature colours all her works, and produces every sort of emotion from the combination of form, light and shade, and colour, it can hardly be inappropriate for man to do the same; and all architects know that monumental colouring may be as well marked as monumental form. Hitherto the proportions used, or, as the ancients more properly called them, symmetry, which forms so important an element in Architecture, has been almost confined to those taken from

THE HIGHEST TRANSCENDENTAL BUILDINGS OF THE PAST;

but we see in Nature every conceivable proportion, and most of these are good; consequently it is only from want of observation and want of skill that we confine ourselves to the proportions of Greek, Roman, or mediæval work; for Egyptian, Assyrian, Arabic, or Indian Architecture has found no great favour in Europe. The thing we want most is the advancement of Architecture, but who is to show us the way? A deceased architect of marked ability said we must wait for another irruption of barbarians, and probably if they were barbarians of improvable quality they might solve the problem; but it would be a drastic measure that most of us at least would pray might not occur in our time. I think the greatest obstacle to the advancement of Architecture is the fact that the bulk of Englishmen do not care about it in the least, and, as far as I can judge, the Fine Arts are not likely to improve if no one cares for them. So every architect should be ready to point out what Architecture does for a nation, and so help to create the want. Architecture—and by that I mean good Architecture—must even, from the size and importance of its monuments,

CREATE SOME SORT OF EMOTION

in the beholder; and the least reflection will show him the vast army of various men that have been employed to get all those materials, and to bring them together, the thousands of craftsmen wanted to fashion them and put them in their places; and according to the stateliness, the impressiveness, or the beauty of these buildings will the power, wealth, and grandeur of the nation that has erected them be brought before his mind. If these buildings are for the highest purposes and clearly express their character, deep emotion will be excited in him, and he will also think of the science that these buildings presuppose, the artistic skill of the architect and artists employed, and of the artistic tastes of the nation at the time in which they were built. As the late Charles Garnier said, "Architecture is an obtrusive art." Its masterpieces thrust themselves upon you, and cannot be hid in a corner, and as long as they remain they call from the people who wish to see them a journey to the land of their creation; so if we want a good account of our time to be given to posterity, we must pick out good architects, encourage them to do their best in erecting important, well-built, and æsthetic structures; at any rate, if this is neglected the age in which we live will be lampooned.

(To be continued.)

THE Roman Catholic community in Carnarvon has decided to erect a pro-cathedral at a cost of £10,000. The scheme has the support of Bishop Mostyn.

THE first meeting of the session of the Auctioneers' Institute was held in the Lecture Hall of the Institute, 57, Chancery Lane, yesterday, the 8th instant, when a paper was read by Mr. Alexander Macmorran, Q.C., upon "The effect of recent decisions on the liabilities and rights of owners in respect of the drainage of buildings." The chair was taken by the President, Mr. Edward Dobson.

* The opening address, delivered by the President of the Royal Institute of British Architects, at the first general meeting of the session 1898-99, held on Monday, November 7th, 1898.

EXCAVATIONS AT THEBES.*

BY JOHN E. NEWBERRY, A.R.I.B.A.

(Continued from page 203.)

THE ruins of the porch to the sanctuary of Hathor are of Ptolemaic date, and lead to a hall with semi-circular vaulted roof and two chambers beyond; the westernmost chamber is a restoration by Euergetes II., in which the reliefs and inscriptions compare very unfavourably with the masterly sculptures of Queen Hatshepsut. The western wall of this central court is built against the steep cliff of the mountain and pierced with a series of niches. In the northern wall is a doorway leading to a vestibule which had three sixteen-sided columns in it. Opposite the door is a small niche, the upper part and ceiling of which had been displaced by falls from the cliffs above, and which I have rebuilt. To the west of the vestibule is an open court in which is found

THE ONLY ALTAR THAT HAS COME DOWN TO US

from Egyptian antiquity. A door in the north wall of this court admits to the funerary chapel of Thothmes I., consisting of two chambers built into the cliff. The Hall of Amon, to the west, is approached only from the upper court, and part of its flat ceiling still remains in position. On the south side of the central court are several chambers, now in ruins and a well-preserved sacrificial hall, with a portion of the semi-circular vaulted roof still standing. This part of the temple was not completely cleared until the season after I left, and I am unable to describe it completely. All the excavations in Egypt are regulated by the Governmental Department of Antiquities. The permit granted to M. Naville on behalf of the Egypt Exploration Fund, I believe, stipulated that the Society should undertake to completely uncover the whole temple, and also do any building work that might be necessary for maintaining or re-erecting the old walls. This is not the usual method in which private excavations are carried on in Egypt. A series of trenches is often all that is required

TO EXPLORE AN ANCIENT SITE,

and discover all the antiquities that may be buried upon it. But in our case it was necessary to remove the rubbish and dust, accumulations of centuries, to a considerable distance from the temple; and it was also found that when the support of the surrounding earth was taken away from some of the walls that they required strengthening. Owing to the kindness of M. de Morgan, the then Director of the Department of Antiquities, we had all facilities granted us for carrying on the work; and he placed at M. Naville's disposal a quantity of Decauville trucks, and quite half a mile of tram line, with all the necessary curves and points for making a complete railway. The general view of the temple taken before our excavations will show that the mounds rose very considerably towards the west; it was therefore necessary to arrange a system of tram lines on three different levels, each of them having only a slight gradient, and some 20ft. above one another. The rubbish was taken in trucks from the highest mounds and tipped on to the next level; from thence it was loaded up again, and tipped down to a lower level, where another system of trucks carried it some quarter of a mile away from the temple to a natural hollow called by the Arabs "birket," or lake. During the two seasons that I was in Thebes a matter of

60,000 CUBIC METRES OF RUBBISH AND STONES

were thus carried away from the temple, a feat that would have been impossible without the aid of a tramway. This arrangement, necessitating the loading up of our trucks three times over, was criticised by some of the visitors that came to the temple, but I do not see how it could have been much improved upon. A steeper gradient would have been dangerous with such workmen as we had to

deal with, who, in spite of all warnings, would push their trucks too fast, and thus run them off the rails, damaging themselves and our rolling stock at the same time. Here, at Deir-el-Bahari, the diggers, drawn from Theban villages, have many of them been tomb-robbers from their infancy, and, consequently, have lynx eyes for small antiquities. The actual digging is done by men with an implement like a short hoe or adze, called a "tooriye," with which they scoop the dust and rubbish into their palm-leaf baskets. Boys then carry these baskets to the trucks, which are drawn up close by, and bring them back to be filled again. Three or four men were in charge of each truck, and pointsmen were stationed at various places. These latter posts were a good deal sought after, as the man in charge had only to push or pull the rail with a hooked stick. He could thus pass his whole day seated and smoking. We employed, on an average, 250 men and boys a day, with eight reises or overseers, one head reis to manage the railway—a clever Pyramid Arab—and a Coptic scribe, who entered the names each morning and kept the accounts. The wages were, for a day lasting from sunrise to sunset, boys, $1\frac{1}{2}$ piastres ($3\frac{1}{2}$ d.) per day; men, 2 piastres (5d.), and 3 piastres ($7\frac{1}{2}$ d.) for the reises. Occasionally the order was given to search each man before he left the works, as

A PREVENTIVE AGAINST THEIR STEALING SMALL ANTIQUITIES,

but we did not succeed in finding anything concealed upon them. Another general view of the temple, taken after our excavations in 1895, shows the magnitude of the work and the degree of success that has been attained. It may be interesting to note here that the great tomb cave in which the celebrated find of royal mummies was made is always spoken of as being at Deir-el-Bahari, but it is nearly half a mile to the south, between the hills of Sheikh Abd-el-Gournah and the cliffs of the Libyan mountains. In the XXth dynasty, during a time of political trouble, it was resolved to protect the royal mummies from the chance of robbery by interring them altogether in this tomb cave. Corpses of the ruling dynasty were also placed here, and all left in peace until 1875, when some Arabs discovered the well hidden resting place. The fellaheen kept their secret until 1881, when they were traced, and Brugsch Bey had all the mummies conveyed to Gizeh. A few yards north of the lower court is a square well-shaft forming the entrance to the common tomb of Theban priests of the XVIIth to XXth Dynasties, which yielded a rich treasure to the Gizeh Museum in 1891. During our first season M. Naville and myself lived in an Arab house in the village of Gournah, a good mile from the temple. This was found to be very inconvenient, and as the work was estimated to take several years for its accomplishment, the Egypt Exploration Fund decided to build

A HOUSE QUITE CLOSE TO THE TEMPLE, which should be the headquarters of the staff. I accordingly designed a building which had a central courtyard with a dining-room overlooking the temple, five bedrooms, two store-rooms, kitchen, and bathroom arranged around it. The foundations were of rubble stones laid in Nile mud mortar, the walls of mud brick, some of them being brought from the monastic buildings that we had to pull down to clear the temple. These in their turn had been pilfered from a XXVth dynasty building some 500yds. away. We found a few of them bearing the name-stamp of an officer of the XXVth dynasty, known from an inscription at Karnak as "the fourth prophet of Amon, the Prince of Thebes, the Governor of the South, Mentuemhat." The bricks measured 12in. by 6in. by $4\frac{1}{2}$ in. thick, and probably only one in every hundred or thousand was stamped. The roofs were flat and ceiled with rafters and boarding, on which was laid a layer of mud bricks on chopped straw, and the whole plastered over with mud mortar. The walls were roughly plastered inside with a mixture of lime, sand, and chopped straw, the lime having been burned in a native kiln, which I had made close by. The floors were of ancient red brick,

floated over and set with a mixture of powdered burnt brick and lime. The joinery, with a few exceptions, was entirely of native make, the doors and windows being hung on wooden pivots, the former being fastened with beech-wood locks and keys. As the house has been used every season since it was built in 1893 by members of the staff of the Egypt Exploration Fund, it has well justified its existence. The great work of copying all the reliefs which cover the temple walls is not yet finally completed, and Mr. Carter, the artist, has already taken up his abode at Deir-el-Bahari for another season's work. In considering some of the details of the temple, we may begin with the lower terrace, on a part of which are a few stones depicting the transportation of two great granite obelisks. Various fragments belonging to this most interesting scene have been discovered in the Coptic buildings which had to be removed, and it is now possible to piece them together sufficiently to show that the obelisks were placed on a great, boat-like barge. This was towed by thirty large rowing boats, arranged three abreast and in lines of ten. There were thirty-two oarsmen in each boat, so that adding officers and steersmen, the crew which towed these obelisks from Assuan to Thebes numbered quite a thousand men. A diagram showing a partial restoration of this scene, drawn by M. Naville, appeared in the Archaeological Report of the Fund in 1895-96. Whether these obelisks were destined for Karnak, this temple, or elsewhere I cannot say.

ONE OF HATSHEPSUT'S OBELISKS AT KARNAK

is still standing. It weighs about 300 tons, and the inscription mentions that these two monoliths were quarried and erected complete in seven months. Professor Petrie believes the pair at Deir-el-Bahari to have been put up by Thothmes III., and identifies the top of one of them at Constantinople. He calculates the weight of each obelisk at the enormous figure of 800 tons. We now ascend to the middle platform, and examine first the sculptures on the southern half of the terrace. The twenty-two square pillars which supported the ceiling are of a slightly tapering form, with delicately-rounded arrises. The scenes on the walls commemorate an expedition to the Land of Punt, which is supposed to lie on the west coast of the Red Sea, corresponding with the modern Somali coast. Incense, panther skins, ivory and ebony were amongst its chief exports to Egypt. A village in Punt is shown, the houses of which are built on piles over water, amongst palms and incense trees, and ladders lead up to the doorways. We see the Egyptian fleet setting sail, and above, its arrival in Punt. Farther on the Queen, followed by her guardian spirit, dedicates to Amon the spoils of the expedition. Cattle are shown feeding beneath delightfully conventional trees. Gold and electrum is weighed, and incense is measured in the presence of the gods. On the corresponding northern half of the same terrace, the scenes refer to the birth of the Queen, but unfortunately in every case the figure of the Hatshepsut has been defaced, though that of her mother Ahmes has been respected. Her admirable portrait is probably

THE FINEST PIECE OF WORK REMAINING

in the whole temple. Though, like all the sculpture, it is in very low relief, the admirable modelling of the delicate and refined features, and the smiling expression, give to the face a beauty which bears witness to the skill of the Egyptian artist, and makes one regret that so little has been left of the original work. A great feature in this temple are the so-called Proto-Doric columns. Those in the Hypostyle Hall are sixteen-sided, measuring 2ft. 7in. in diameter just above their shallow circular bases, and they are 15ft. 9in. in height, tapering to an upper diameter of 2ft. 4in. The abacus is square and flush with the shaft, and a simple band of hieroglyphics appear on one face. Prototypes of this form are to be found in the rock-cut tombs of Beni Hasan, which differ only in having fifteen of their sides fluted like a Greek-Doric column, and one left flat to receive the dedication inscription. This Hypostyle Hall, which forms a

* A paper read before the Architectural Association at a meeting held on Friday, October 28, 1898.

vestibule to the Shrine of Anubis, is in a very perfect state;

THE FLAT STONE CEILING

resting on massive architraves, and the supporting columns, are all intact. The ceiling is painted blue and powdered with yellow stars. The spacing of the columns is wider in the centre, so as to form a better approach to the chambers beyond. The granite doorway leading to the central court is one of the most striking features of the upper platform. It is specially interesting in that it shows clearly the erasures around the cartouches which bore the Queen's names, "Ma-ka-ra, Hatshepsut," but which now read "Ra-men-Kheper, Tehutimes," the names of Thothmes III. Where these alterations occur one can see plainly that the surface of the granite has been rubbed down to admit of new signs being inscribed. But, irrespective of erasures, Egyptologists are able to prove that the Queen's cartouches must have been there, by the fact that the surrounding inscriptions are in the feminine gender. That great doors were once hung here is shown by the pivot and bolt holes on the inside. A somewhat similar granite portal on the further side of the central court leads to the sanctuary, a narrow hall with a semi-circular stone roof. These

CURVED VAULTS

occur in several parts of the building, and are not true arches, but built with horizontal joints, forming really a series of corbels curved on the inside. Nevertheless, it appears quite certain that the Egyptians understood the principle of the arch, and used it in brick buildings. The so-called granaries of Rameses, behind the Ramesseum, are notable instances of arched constructions of the nineteenth Dynasty; but last season Professor Petrie unearthed a mastaba, or built tomb, at Denderah, with three ring brick arching to it, which belonged to a prince named Adu, who lived under Pepy II. of the sixth Dynasty—at least 4000 and perhaps 5000 years ago! The great stone altar which stands in the middle of the Altar Court is one of our most interesting finds. It is a rectangular structure of fine white limestone, measuring about 16ft. by 13ft. At the western end is a flight of ten steps leading to its upper surface, 5ft. 2 in. above the floor. It is crowned with the usual bold cornice so common in Egyptian Architecture, consisting of a large bead and cavetto moulding, and a similar bead to that on the cornice is worked on each angle of the altar mitring with the cornice bead.

THE PROPORTIONS OF THE STEPS

leading up to the altar are worth mentioning, having a rise of 6' 2 in. and a tread of 19 in.; but the treads are not level, being "kilted," or inclined, as much as 1' 85 in. The height of each riser is thus only 4' 25 in. The Altar Court was evidently always open to the air, and its walls are consequently uninscribed and quite plain. They are built to a batter, as are most walls in the temple, and were finished with an overhanging cornice. I carried out some considerable repairs here, consisting of rebuilding portions of the walls and altar, and forming rough retaining walls against the loose and friable cliffs on the north. In the middle of the north wall of the Altar Court is the doorway leading to the Funerary Chapel of Thothmes I., a chamber at right angles to the court, and measuring 17ft. 3 in. by 5ft. 2 in. wide, and roofed with a curved ceiling of elliptical form with horizontal joints. At the north end is a stone seat, and above it is a much mutilated scene. It represented on the left a shrine, in which stood the symbol of the god Anubis, a skin on pole. Before the shrine stood the Queen, now completely defaced, and behind her Thothmes I., her father, whose cartouche reads "Aa-kheper-ka-ra." In the upper part of the scene were two jackals, also emblems of Anubis, each couchant on a shrine. In the centre is the cartouche of the Queen, "Ra-ma-ka," or "Ma-ka-ra" as it is now reads. At the north end of the chapel and on the western side is a niche for the reception of offerings. In the passage between the southern enclosure wall and the retaining wall

of the middle platform, not far from the Hathor shrine,

AN INCLINED PLANE CUT IN THE ROCK

was discovered, leading to the entrance of a large tomb. The rubbish was here quite untouched, and when the doorway was cleared disclosed a large shaft, well cut in the rock, and opening into a larger chamber. In the middle was a square space for a stone sarcophagus, but, instead of the surroundings of an important burial, there was only a poor wooden coffin with bones in it, which seemed to have been disturbed. No inscription or ornament of any kind was to be seen except a few hieratic signs. M. Naville thinks it probable that this tomb was prepared by Hatshepsut for herself, but was never used owing to the hatred of her nephew, Thothmes III. In this same passage a large foundation deposit was discovered in a rock-cut pit, about 3ft. deep. It was covered with mats, under which lay first a few pots of common earthenware, then about fifty wooden objects, models of an implement which, for the want of a better name, have been called winnowers. M. Naville says that they may be sledges used for threshing corn. Each bears the cartouche of the Queen. Lower down were fifty wooden hoes, four bronze plaques, a hatchet, a knife, eight wooden models of adzes, and eight larger adzes with bronze blades; at the bottom were ten little pots of alabaster and ten baskets, stands for the pots. All these objects were, as usual, buried in fine sand. In every Egyptian temple the sanctuary contained a shrine or naos, in which were hidden

THE EMBLEMS OF THE GOD

to whom the temple was dedicated. They were generally made of wood, so that they could be moved and either placed on sacred boats, or carried by means of staves, as was the ark of the Israelites. All the wooden shrines have perished, except a very small one, but 12 in. high, which is now in the Turin Museum. During our first season we found one side of a large ebony shrine, the panel measuring 5ft. 7 in. high, 3ft. 7 in. wide, and 1 in. thick; also one leaf of the doors of the shrine, which is 2ft. 5 in. high, 12 in. wide, and 3 in. thick. On the inside of the shrine one can see the mortises and part of the adjoining panels. As ebony can only be obtained in small sizes, the whole is pieced together of little bits, and held by pegs of the same wood. The angles or styles are cut out of solid pieces, 2 in. square, to which are framed the top and two middle rails of the same width as the angles, but only 1 in. thick, thus dividing the whole into three panels. The bas-reliefs represent Thothmes II. making offerings to Amon-Ra, the erasures being probably owing to Akhenaten. Underneath are a series of magical signs, arranged in pairs, and the symbols of stability and duration. At the bottom is a range of the so-called false or "Ka" doors. Externally the panel is divided into six divisions, two of the rails being only thin pieces of ebony pegged on, forming what we should term a sham. Rows of the same emblems are arranged in the panels, and the styles or rails are

BEAUTIFULLY CARVED WITH DEDICATORY INSCRIPTIONS

of Thothmes II., part of which reads "He made a sacred shrine of great value of ebony of the mountaineers (of Nubia)." On each of the horizontal lines it is stated that Thothmes is a worshipper of Amon-Ra, who dwells in "Serui," the ancient name of the temple. The small leaf of the double door is also made of irregular-shaped pieces of ebony, doweled together, and having eleven small ledges pegged on to one side, each of them about 3 in. by 1 in., and rounded on the back. The pivot side of the door is also rounded, and the bolt side rebated for the other leaf. Four bronze staples for the bolts are still in position. A description of this temple, however slight, would be incomplete without a reference to its celebrated architect, Senmut. It seems that though Hatshepsut, like Queen Elizabeth, was not beloved of her relations, yet she had the same power of drawing to herself great men.

Of such a man, Senmut, the architect of her temple, we have many records. To quote the *Edinburgh Review*: "The many sidedness of Michel Angelo was nothing compared to that of Senmut—the Queen's architect—who himself superintended

THE QUARRYING AND CARVING OF THE QUEEN'S OBELISKS,

was tutor to the Queen's daughter Neferura; he was keeper of the temple of Amon; keeper of the granaries of Amon; royal seal-bearer; keeper of the palace; keeper of the heart of the Queen (to which title Petrie compares keeper of the king's conscience or Lord Chancellor), priest of Aahmes; keeper of the queen's cattle." Besides his great work at Deir-el-Bahari, he directed the erection of Hatshepsut's two granite obelisks at Karnak and superintended architectural work at the temples of Karnak, Mut, Luxor, and Erment. A kneeling statue of him was discovered by Miss Benson in 1896 at her excavations at the temple of Mut. The inscription states that it was "presented by favour of the queen," and some further interesting particulars of his life will shortly appear in her book on this temple. My brother had the good fortune to discover his tomb high up on the north-east of the Gournah hills. It had been very magnificent, but the

PAINTED FACING OF THE WALLS

is now almost entirely destroyed. A clear white glass bead, inscribed Senmut, was found at Deir-el-Bahari, as well as a fragment of a statue of him. My brother has a carefully-worked piece of black marble inscribed with his name, which appears to have been a paint-muller, and may have been used by him for mixing up his Indian ink. It is recorded that he was a man of the people, for "his ancestors were not found in writing," and his portrait-statue gives no very high-bred features, but an ugly, capable, complacent face. In conclusion, I must acknowledge my indebtedness to the various publications of the Egypt Exploration Fund, by M. Naville, which I would refer you to for further information on this interesting and beautiful temple; also to Professor Flinders Petrie's "History of Egypt," and Professor Steindorf's edition of Baedeker's "Guide to Egypt," 1898.

The president, Mr. G. H. Fellowes-Prynne, opened the discussion, and Mr. R. Phené Spiers proposed a vote of thanks to Mr. Newberry. Mr. Spiers said they owed a great debt of gratitude to the Egypt Exploration Fund, to M. Naville, and to Mr. Newberry. He had, however, to traverse Mr. Newberry's statement when he said that "it was reserved for the Egypt Exploration Fund, under the able guidance of M. Naville, to bring to light one of the most interesting temples of Egypt, of which up to 1893 two-thirds were covered by mounds of rubbish that reached to a height of 40ft. in places." The real discoverer of the temple was Emmanuel Brune, a Grand Prix man, who measured, with some slight assistance from the speaker, the whole of the temple, and made some astonishing drawings for the Institute of France in 1867. Mariette borrowed these plans and published them, but forgot to acknowledge his indebtedness to Prof. Brune. Prof. Brune, who was dead, was one of the most remarkable men of his time, and he (the speaker) felt bound, as his friend and companion, to take up his case.—Mr. Alex. Payne, in seconding the vote of thanks, expressed his opinion that this temple was a sort of cemetery or mortuary building.—The Chairman put the vote of thanks, which was carried.—Mr. Newberry, in reply, said he had purposely not dealt with the restoration. He did not think that M. Naville could have made such a claim, because when he (the speaker) first went to Deir-el-Bahari, the greater part of the architectural details of the southern side of the temple were already exposed to view, and the Hypostyle Hall was accessible, though one could only just creep in between the architrave and the rubbish.—The Chairman announced that the next meeting of the A.A. would be held on November 11th, when Mr. H. Wilson would read a paper on "Arts and Crafts."

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
November 9th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

To estimate the cost of putting a fresh coat of paint on a building would appear to be a very simple matter indeed to anyone in the trade. Apparently, however, the very reverse is the case. The other day the Main Drainage Committee of the London County Council invited tenders for the repainting of their pumping stations, and the most surprising difference was shown in the prices submitted. Thus, one firm offered to undertake the work for £2092, and another was only willing to accept the contract if a sum of £4872 was paid. To what can this wonderful discrepancy be attributed?

THE completion of Truro Cathedral will continue, says a local contemporary, to be the object of ambition with Churchmen of Cornwall for many years to come. The ambition, we may add, will by no means be confined to the county. The Diocesan Conference is of opinion that building operations should be resumed next year with a view to the erection of the nave. Funds to the amount of £27,000 have been raised, and though a considerable amount is still needed, it is thought that the present state of the finances justifies the step which is now contemplated. In regard to the cathedral, it is assumed that the resumption of building operations will encourage those interested in the work to contribute the funds necessary to enable it to be continued. Certainly it would be a lamentable thing if, when the work is once in progress, it is either stopped or its noble proportions cut down for want of money. It would be better to put off building for another generation than to diminish in any way the glory of the completed structure.

ONE by one Sir Christopher Wren's smaller churches in the City of London are disappearing. That these churches were needed when he built them, and are now superfluous, shows what immense changes have come over London life in the last two centuries. The latest church doomed is St. Michael's Bassishaw, in Basinghall Street, just behind the Guildhall. This church was completed by Wren in 1679. It replaced a structure that had perished in the Great Fire. "Bassishaw" may be read as Basing's-haugh. The Basings had a mansion in the neighbourhood in the thirteenth century, when certain Basings were sheriffs, and one, Solomon Basing, Lord Mayor. But even Stow could write: "This family is worn out, and hath left the name to the place where they dwelt." St. Michael's Church—which has been condemned under the Union of Benefices Acts—has one peculiarity. It is insulated; you can walk completely round its walls. In Basinghall Street the east front looks down

on a broad pavement, where two plane-trees and a pillar-box stand in symmetrical decorum. The other three sides approach so closely to the surrounding buildings as to leave only narrow pathways. But the little square is a veritable lagoon of quietness. The monuments in St. Michael's Bassishaw are not remarkable. The living will henceforth be joined to that of St. Lawrence Jewry, the well-known church at the south-west corner of the Guildhall Yard. St. Lawrence's is another of Wren's churches; it numbered Isaac Barrow among its preachers and Samuel Pepys among its worshippers.

THE fate of the Church of St. Mary, Moorfields, the only Roman Catholic place of worship in the City, is now being decided at Rome, whither the Rev. Dean Fleming has gone to lay the whole of the facts of the case before the ecclesiastical authorities. Various circumstances have conspired to raise the question of the desirability of disposing of the church and its site, and erecting a smaller church elsewhere with part of the proceeds, the freehold being valued at as much as £200,000. One of the chief causes of uneasiness to those who would prefer the church to remain is the growing necessity to widen the thoroughfares upon which it abuts. Already the neighbouring building, the Royal London Ophthalmic Hospital, has been acquired for street improvements, and its removal leaves the schools attached to the church in a very precarious condition. If additional width is to be given to the rest of Blomfield Street the handsome portico will have to come down. In the meantime, too, the question of underpinning the sacred edifice is a matter of considerable urgency. An appeal for the £1000 necessary to complete the work has been made, and it is stated that "only the generous indulgence of the City Surveyor in extending the period for which the timber supports may remain has enabled the Dean to keep the church open for public service." These various causes have made the future of the church a matter of discussion, with the result that Cardinal Vaughan has decided in favour of a sale. An appeal to Rome is permissible in such cases, however, and it is for this purpose that Dean Fleming has gone to the Holy City. If the final authority supports the Cardinal's view, the existence of the church will be terminated; but if other counsels prevail, it is anticipated that no difficulty will be experienced in raising the funds for meeting the requirements of the City Surveyor.

THE church, which is said to have cost £26,000, is in the Italian style. At the back of the high altar is raised a screen of six fluted marble pillars of the Corinthian order, the gift of Pope Pius VII. Behind is a fresco painting of the Crucifixion, of world-wide renown, by Signor Aglio, painted by him in 1820, and restored by him in 1837. This striking panoramic view of the great scene is 55ft. in length and 33ft. high, and contains upwards of fifty chief figures of more than life size in the foreground, whilst the background is formed of a distant view of Jerusalem. The removal of the church would mean the destruction of this remarkable fresco. Under the church are vaults and passages divided into catacombs.

THE evils of overcrowding and bad housing make themselves felt in the spread of disease, increased death rate, physical and moral degeneracy, and in other ways. The Housing Committee of the County Council considered that in London, where over two hundred thousand people live in one-roomed tenements, and where, in some districts, accommodation is inadequate, and rents always high, the Council should do something more to relieve the pressure. Up to now the Council has only built dwellings for part of the people displaced through the clearance of insanitary areas, or the execution of improvements. It has not provided more accommodation. The committee thought that as land can be bought cheap on the outskirts of London, the Council might find it expedient to build on a large scale, so as to draw the people from the over-

crowded centres. It has power to do this under Part III. of the Housing Act.

THE chief officers of the Council were consulted, but did not encourage the scheme. The architect thought it would not pay; the medical officer reported that if the Council started to build on the borders of London, private builders would stop, and the Council would never be able to build fast enough for the demand. The valuer considered that cheap transit, through electric tramways, will draw people from crowded centres to the suburbs. It was also pointed out that building was going on fast enough in the suburbs, where there was little or no overcrowding, but that in more central districts, where it is convenient or necessary for working-men to live, building had ceased, and every year the encroachments of business premises increase the overcrowding and send up the value of land and the rents. The Housing Committee considers that there is scope for a new development here, and recommends the Council to buy vacant land where opportunity offers, and build, so long as no loss is incurred, and that without regard to any previous displacement. This is an improvement.

A CORRESPONDENT writing to the Chronicle says: "When I was in Oxford lately I was asked to sign a petition to the municipality of Florence, praying it to refrain from the destruction of its beautiful and historic city. I did so with pleasure. Yet I should, with even more pleasure, have signed a petition to a government nearer home, praying it to take measures for the preservation of our own beautiful and historic cities, at the head of which stands Oxford. A few days later I heard that a charity is on the point of disfiguring the corner of St. Aldate's, opposite Christ Church, by the destruction of the picturesque end of Pembroke Street, and the erection of a block of buildings, described as 'workhouse-like.' This block was originally intended to stretch beyond the old houses, and to cover the site of the tree at the corner of the churchyard. Christ Church has intervened in favour of the tree; but exactly how far the offending block has been curtailed I do not know.

"THE action of the charity will be defended on the grounds that, firstly, it is a charity; secondly, that the houses in Pembroke Street are of no importance. On the first point it may be said that the architectural beauty of Oxford is a matter of public interest as much as the beauty of a Raphael or a Titian, and that a charity has no more right than another body to increase its revenue without regard for such interests. This was the view taken by the Press and the public three years ago, when the Trinity House proposed to pull down their beautiful old almshouses and sell the site for building purposes. A vigorous and effectual protest was made, and the scheme quashed. Secondly, the houses in Pembroke Street have a value as being among those fragments of the mediæval city which modern vandalism has so far spared. Every one of such fragments is precious. . . . The city council has recently shown by its refashioning of Carfax how a modern improvement may be carried out satisfactorily as such, yet with good taste and entire reverence for the spirit of Oxford. . . . The destruction of the ancient city of Oxford, deplored as deeply by visitors of every nationality as that of the ancient city of Florence, is not the inevitable result of the necessities of modern life."

THE decision of the Executive Committee of the Gladstone Liberal Memorial Fund to commission Mr. F. W. Pomeroy to execute the statue of Mr. Gladstone which is to be placed in the Houses of Parliament, is one that it would scarcely be possible to praise too highly. We have few sculptors (says the Globe) so well qualified to deal with a work which will call for a peculiar combination of skill and discretion, and few artists who have given such unquestionable evidence of the possession of the kind of knowledge required for the production of a statue which must hit the happy mean between realistic portraiture and idealised

personification. We can feel sure that in his hands the memorial will be fully worthy of its subject.

MR. POMEROY'S statue of "Perseus," which occupied the place of honour in the sculpture room at the last Academy Exhibition, proved most emphatically how great an amount of sound appreciation he possesses of what constitutes true dignity of design, and his Burns memorial recently erected at Paisley showed his originality in the treatment of a subject which might very easily have been made uncouth or even grotesque. He may well be expected to combine in the Gladstone statue both dignity and originality, and to make the most of an opportunity greater than often comes within the reach of a young artist. It is a pity, though, that the Committee should have decided upon a design representing Mr. Gladstone in the unpicturesque garb of the present day. Such a limitation very seriously diminishes the sculptor's chances of a great success.

ANOTHER work which will have a very remarkable interest both on account of its subject and because of the reputation of the artist who is to produce it, is the statue of Lord Tennyson, which has been undertaken by Mr. G. F. Watts. His fitness to attempt such an exacting task is most complete, for he has painted many portraits of the poet, and knew him intimately for something like half a century. At the same time, one cannot but wonder at the energy of the artist who, despite his advanced years, does not hesitate to commence a new undertaking of this serious importance.

THE General Committee of the Belfast Cathedral has just considered the report of the Architects' Sub-Committee. It was as follows: "(1) That they believe Mr. Drew's original design is impracticable from want of funds, and the difficulties arising from defective foundation and surrounding property. (2) They approve Mr. Drew's second design, as described by him, and as shown by a ground plan and sketch presented by him, the total accommodation to be ultimately provided being about 3000, and the cost, including foundations and internal fittings, £47,500. (3) They recommend that as a first instalment of the work the nave and side aisles only should be built, to accommodate, with part of the present church, 2000 people, the cost of which, including foundations, Mr. Drew estimates at £14,000. (4) They consider that what Mr. Drew strongly urges—namely, the extension of the church eastward, to include the crossing of the transepts to provide a space for the choir, but not the full extension of the transepts—should be favourably entertained, and, if funds permit of it, adopted. This would increase the first cost by about £7000. (5) They recommend that the building of the tower, north and south porches, chancel, vestries, and extension of transepts should be postponed for the present, and that no purely ornamental or decoration work be undertaken, except a west doorway, or some portion of the west front, in order that a sample may be given of the sort of ornamentation which it is hoped may in future characterise the entire cathedral." This report was unanimously adopted.

THE Finance Committee of the Middlesex County Council, on behalf of the joint committee of Surrey and Middlesex, presented supplementary estimates to the extent of £35,000 for the rebuilding of Kew Bridge. The report of the joint committee showed that while the estimate of the total cost of the widening, given by their engineer—Sir J. Wolfe Barry—was £118,000, the lowest of seven tenders received for the work, that of Mr. Easton Gibb, of Skipton, Yorkshire, was £169,288. In reply to a request for an explanation, Sir J. Wolfe Barry reported at the last meeting that his estimate was based on the prices paid for similar work at the Tower Bridge, with a considerable addition. He suggested that the cost of all work in the neighbourhood of London had been steadily increasing during the past two years

owing to the obligations imposed by the Employers' Liability Act, the action of the London County Council with regard to the terms of labour, and the great demand for materials at the present time. He estimated that £20,000 to £25,000 might be saved by the substitution of internal brickwork or concrete for stonework. The committee further reported that they had ascertained that a reduction of about £20,000 might be made on Mr. Gibb's contract in the way suggested, and they recommended that the tender should be accepted for a sum not exceeding £150,000, and that a Bill be promoted to authorise the additional borrowing.—Mr. Burt, of Highgate, moved as an amendment to the report of the joint committee that the council should not entertain the proposed additional expenditure, but should refer the matter back to the joint committee with a view to bringing the total cost of the bridge approximately within the amount authorised by Parliament, and this was agreed to.

A PROPOSAL is on foot for utilising part of the site of the Brighton Aquarium for the construction of a winter garden. This will involve various structural alterations, regarding which, according to the terms of the Company's Act of Parliament, the Brighton Town Council have certain rights. In order to facilitate the negotiations, it is contemplated by the syndicate that has the matter in hand to offer the Town Council opportunities for materially improving the marine parade, or at any rate that portion of it which runs the entire length of the Aquarium Company's building, that is to say, from the Old Steyne eastwards to the site of the now vanished Chain Pier. At this latter point the broad esplanade that runs from the eastern boundary of the borough (Kemp Town) is checked by the flight of steps that lead to the beach, and thenceforward to the Steyne become much narrower. The proposals now under consideration have as their object the widening of this part of the esplanade, which, instead of following the concave shape of the cliff, would be brought out into practically a straight line, being thus widened by from 15ft. to 25ft. Skeleton erections have been placed *in situ*, so as to indicate the important improvement which would thus be effected. A sub-committee of the Council has the matter under consideration. Meanwhile, progress is being made with the new Palace Pier opposite the Aquarium. The pier has already been carried out to about 1600ft.

SUBURBAN theatres increase so rapidly that soon no populous district will be without a dramatic temple of its own. The latest addition is the Crown at Peckham, which is a two-tier house. The ground space is considerable, and there are no less than twelve exits, two being provided for every part of the house. The architect is Mr. Ernest Runtz. The tiers, like the staircases, are of fireproof material. Special attention has been bestowed upon the ventilation and warming of the building, and the electric light is adopted throughout.

MESSRS. BAKER AND SONS, acting on the instructions of the Bridge House Estates Committee, offered by public auction, on a building lease for a term of eighty years, the building site abutting upon Finsbury Circus and London Wall, about which so much has been said and written. It will be remembered that an attempt was made at the last meeting of the Court to induce the City Corporation to rescind its previous decision to let the land in one block. The Corporation as a body, not being blind to its own interests, wisely declined to do so. The land, which comprised nearly 50,000ft., was accordingly offered as a whole. Bidding started at £10,000 a year, and was quickly run up to £17,000 a year, at which price it was purchased by Mr. Neumann, of Warnford Court.

A BOULDER of extraordinary dimensions has been unearthed on the farm of Mr. E. F. Horton, Little Leigh, between Northwich and Warrington, part of the estate of Lord Leigh. It measures 12ft. 8in. in length, 7ft. 7in. in breadth, and 6ft. in depth, must weigh close

upon forty tons, and is certainly one of the largest boulders ever discovered in this country, exceeding many that have been mentioned in the records of the various learned societies of the kingdom, which include three on grounds attached to Leasowe Castle, Wallasey, the residence of the late Lieut.-General Sir Edward Cust. The Crosby and Manchester boulders, which have been carefully preserved, are small compared with this discovery.

THE London County Council having, by its General Powers Bill of this year, obtained power "to erect and maintain or contribute towards the provision, erection, and maintenance of works of Art in London," will shortly proceed to erect upon the approved site, at the extreme end of the Victoria Embankment wall, by the corner of Westminster Bridge, the Boadicea statuary group of the late Mr. Thomas Thornycroft, which has been presented to the Council by Mr. J. I. Thornycroft. The Highways Committee, at the last meeting of the Council, asked for the sum of £1100 to cover the cost of placing the group in position, and the expense already incurred in putting up and removing the temporary platform upon which a plaster cast of the group was recently exhibited. Mr. T. G. Jackson, E.A., who has been in communication with the Council's architect on the matter, has submitted a sketch, which has been approved by the Highways Committee, of a pedestal for the group. The height of the base of the group is shewn upon this sketch to be about 11ft. 2in. above the top of the Embankment steps—that is, 5ft. higher than the temporary platform for the plaster model. A joint report from the Council's engineer and architect suggests that the inner portion of the pedestal should be constructed of brickwork, and the upper part faced with Portland stone and the lower part with granite—as this mode of construction would be less expensive than the use of granite throughout; and that the cover of the pedestal upon which the group will stand should be bronze. The estimated cost of this mode of construction, which the Highways Committee adopt, will be £1000.

A SCORE of paintings from the exhibition at 35, New Bond Street, and all of them—save the enormous canvas of "Christ Entering Jerusalem," by M. Paul Philippoteaux—are from Gustave Doré's hand. But these pictures (including the Philippoteaux)—"great," at any rate, in one sense—are not strangers to the London public. They were here long and left us late. After a successful time on tour in America, "Christ Leaving the Prætorium," "The Vale of Tears," "The Ascension," "The Dream of Pilate's Wife," &c., are back again in their old quarters.

SKETCHES IN NORMANDY.

THE sketches reproduced in our inset supplement were made during a short holiday in Normandy. They represent subjects which may, no doubt, have been sketched and described many times, situated as they are in a country so full of interest to the artist and student, rich examples of architecture and picturesque bits abounding in every direction.

Caudebec is a very old and interesting town, its picturesque streets and timbered houses supplying the artist with ample material. The principal feature is, of course, the church, a beautiful specimen of the fifteenth century, exhibiting the Flamboyant style in all its perfection. The tower is divided into three stages, with rich buttresses and windows, and is surmounted by an open worked stone spire (the subject of one of these sketches) of the most delicate workmanship.

One of the most beautiful towers is that of St. Laurent, in the Rue Thiers, Rouen, built at the end of the fourteenth century; the upper part is exceedingly rich in appearance, crowded with flying buttresses and pinnacles. The church itself, or rather the remains of it, is now used as a workshop. The small balcony at the side has a very quaint appearance.

Professional Items.

BATTERSEA, S.W.—A literal palace, standing in its own grounds of 8½ acres, in connection with the temporary home for lost and starving dogs at Battersea, was formally opened by the Duke and Duchess of Portland at Hackbridge, near Mitcham, Surrey, on Saturday week. This branch home has been provided at a cost of £6171, including £3194 for the land and £1197 for the kennels, the architect being Mr. Edward Crutchlow.

BIRMINGHAM.—A church in connection with the Parish Church of Edgbaston, Birmingham, to be known as St. Mary and St. Ambrose, in the Pershore Road, has just been consecrated by the Bishop of Worcester. The building, which was commenced about September of last year, has been built by Messrs. Collins and Godfrey, of Tewkesbury, from the designs of Mr. J. A. Chatwin, at a cost, exclusive of fittings, of about £8000. The building is not yet finished, for the tower, spire, and tubular bells are not expected to be completed before Easter next. The church, which is near Calthorpe Park, has from every aspect a pleasing appearance. The exterior is of brick and terra-cotta, and the interior of plain red brick, with Bath stone columns, capitals, and chancel arch.

BLACKROCK, N.B.—On Saturday week, the memorial stone was laid of St. Andrew's Presbyterian Church, Blackrock, N.B. The plan of the building is somewhat unusual, showing an octagonal building arranged to form an auditorium. It measures 50ft. in diameter internally, and is covered by a large cupola, with lantern light at apex. A square tower, 80ft. high, terminating with an open belfry and pyramidal roof, adjoins the side of the octagon next to Mount Merriem Avenue, and on the opposite side an apex has been formed to contain the pulpit, communion table, and font, which will be placed on a raised platform. The lower part of the tower forms a porch, from which side passages lead to circular turrets, containing the gallery stairs, and an organ gallery is provided immediately over the porch. The style of Architecture is Romanesque. Mr. J. C. Murray is the architect.

BRECHIN.—The Gardner Memorial Church is now rapidly approaching completion. The church, which occupies a site at the corner of St. Ninian's Square and Damacre Road, completes the improvements that have been carried out there by the Town Council. The church runs parallel with Damacre Road, while at right angles to the church a hall and vestry are provided, running up Southesk Street. At the junction of the church and hall building a massive square tower has been erected, upon which, facing the square, the city arms have been cut out in relief, the whole forming a beautiful piece of sculpture. The church consists of an aisle and a nave.

BRISTOL.—The Edinburgh Life Assurance Company have recently erected new offices at the corner of Baldwin Street and Marsh Street, Bristol. They are constructed of red brick with pennant and Bath stone dressings, the roof being covered with Bangor slate. The style of Architecture is Georgian. The building is fireproof, and has wood block floors with the exception of the ground floor, entrance-hall and passages, which are of marble mosaic. The building comprises five floors, a speciality having been made of the lavatory and sanitary arrangements. The entrance hall is panelled out with tiles of an exceptionally pleasing character. The premises on the ground floor, which will be used as the Company's offices, are panelled with teak, and all the doors and chimney pieces are also of teak, and the floors are marble mosaic and oak block. The electric light fittings, door furniture, name plates and tablets are of a special kind of red bronze, and are very effective. The staircase is in oak. Mr. A. J. Beaven, of Dean Street, is the builder. The architect, who has superintended

the erection of the buildings, is Mr. James Hart, of Corn Street. The sanitary appliances have been provided by Mr. A. S. Scull, of 17, Redcliff Street.

DUBLIN.—A memorial window has just been erected at the United Presbyterian Church, Dublin. The tracery of the window is of an Early English pattern, and the glass ornamentation, which follows the style of the famous Albert Durer, has been designed with a view to preserving a harmony between it and the masonry. The work has been executed by Mr. Joshua Clarke, of North Frederick Street.

LEEDS.—Considerable progress has been made with the building operations of the new Queen's Theatre, Holbeck, Leeds, which were begun barely a year ago. Now the roof is on, and it is expected that the place will be opened on Christmas Eve. The situation—at the corner of Jack Lane and Meadow Road—is an admirable one of its kind, embracing as it does an area of nearly 1000 square yards, with streets on practically all sides. The principal entrance is at the corner of the thoroughfares above mentioned, and the façade is semi-circular in consequence, the red brick and stone dressings being crowned with a dome. It is being built for Messrs. Dottridge and Longden, of Oldham, and Messrs. Morell and Mouillot, of London; and the plans are those of Mr. W. Hope and Mr. J. C. Maxwell, architects, of Newcastle-on-Tyne. While the exterior is likely to greatly improve the aspect of Meadow Road, the interior has been designed to meet every modern requirement as regards comfort and convenience. A good part of the skeleton of the seating accommodation (more than 3500) is in position, but a great deal remains to be done. Mr. S. F. Davidson, of Newcastle-on-Tyne, is the contractor.

LONDON, W.—The foundation stone was laid last Monday week of the new front blocks of the St. Marylebone Workhouse, now being erected in Marylebone Road, which, when finished, will complete the institution. The buildings in course of erection will comprise two large double-ward blocks, each of which will be three stories in height above the ground floor, with a fourth story in the centre. There will be provided wards, dormitories, day rooms, bath rooms, officers' rooms, and, in the basements, a complete set of workshops. The total accommodation will be 555 beds for old and infirm men, eleven male and ten female imbeciles, and three male and three female lunatics. The work, which is expected to be finished about March or April next, is being carried out at a cost of £52,100. The buildings are being erected by Messrs. G. H. and A. Bywaters and Sons, the architect being Mr. A. Saxon Snell.

LONDON, E.—The "Passmore Edwards" Public Library for the parish of St. George-in-the-East was opened on Saturday week by Lord Russell of Killowen. The building is notable in a neighbourhood where attractive buildings are few, and it contains an excellent general reading room about 50ft. square, which will be a great boon to the inhabitants of the congested dwellings and depressing streets of the East end of London. The Library has been erected in Cable Street, on a site adjoining the Vestry Hall, at a cost, including that of the site, of £10,125. The architect of the building is Mr. Maurice B. Adams, F.R.I.B.A., who has designed many of the public buildings erected by Mr. Passmore Edwards.

NEWPORT.—A new church has been erected at Newport. The building, which it is estimated will cost between £10,000 and £12,000, is in the Early English style, of blue pennant stone, quarried near Risca, with Bath stone traceries, windows, piers, and dressings. There are nave, north and south aisles, organ chamber, spacious choir and clergy vestries, lavatories, and heating chambers. The nave is 92ft. in length and the chancel 39ft., or a total length of 131ft. The width is 61ft., and the height to the apex of the nave roof 62ft., the chancel being 46ft. high. The handsome tower

at the north-western end is 120ft. high from the floor level to the tall crocketed pinnacles which surmount it. The main entrance is below the tower, which is well built, and capable of carrying a peal of eight bells. For the present, however, a single bell, which will form the treble in the peal, is placed in position. The roof of the building is of pitch pine, open, whilst the floor mainly consists of wood blocks, the exception being the sacarium and porches, where tessellated tiles are laid. Like the exterior of the building, the view of the inside is exceedingly fine. The nave is divided into six bays, which, with the quatrefoil-shaped piers, are of Bath stone. The altar, reredos, pulpit, and lectern are of brown, unpolished oak, richly carved. The reredos represents the Lord's Supper, and the east and west windows are filled with painted glass, the subject of the east window being the Ascension of our Lord. The font is of Caen stone, treated in the Early English style, to correspond with the rest of the building.

SHEFFIELD.—A new Wesleyan school-chapel, in connection with the Sheffield Brunswick Circuit, was declared open a few days ago. The school-chapel is placed in the heart of the network of new houses which have sprung up of late years. It is in the free Renaissance style of Architecture. The architects are Messrs. Helmsoll and Patterson, the builder Mr. A. Moore, the joiners Messrs. Bolsover Bros., and the plasterers Messrs. Hodkin and Jones.

SWANSEA.—The new operating theatre which has been added to Swansea Hospital was formally opened on Friday week. The chief feature of the new building is its completely sanitary character. It is connected with the west corridor of the hospital, and is so placed as to be equally accessible to the different wards and administrative block. It is oval in shape, being 26ft. long by 22ft. wide, and the roof is in the shape of a large dome. The building is constructed without the use of wood, the roof being of iron ribs filled in with cement concrete, and covered with red Broseley tiles, bedded in cement. The exterior is designed so as to be in keeping with the surrounding hospital buildings, being built of native stone in courses, with dressings of Bath stone. The contractor for the general work was Mr. Henry Billings, of Swansea, and the architects are Messrs. Wilson and Moxham, of Swansea.

WALKLEY.—The foundation stone of a new Baptist Chapel at Walkley was laid just recently. The scheme embraces the erection of a new school, class-rooms, and vestries, and the lengthening of the church by 12ft. Messrs. Hemmell and Paterson are the architects for the work, and the contractors are:—Mr. F. Ridal, mason and bricklayer; Mr. J. H. Hodkin, joiner; Messrs. Ellis and Wetherill, slaters; Messrs. Unwin and Sons, plasterers; and Messrs. Snowden and Son, plumbers and painters.

WALTON.—The memorial stones of a new Primitive Methodist chapel and schools to be erected in Church Road, Walton, were laid a few days ago. The design will be Gothic, simply treated, being faced with Liverpool grey bricks and Runcorn stone dressings, the bands and arches being of stock bricks. The cost will be about £2500. The work is being carried out by Messrs. J. and G. Chappell, of Walton, and the architect is Mr. Fred W. Dixon, of Trevelyan Buildings, Manchester.

WORTLEY.—The new Church of St. John the Evangelist, Wortley-de-Leeds, has just been consecrated by the Bishop of Ripon. The design of the new building is founded on the perpendicular style, somewhat freely treated. The chancel is approached by seven steps, and on its north side there is an organ chamber and priest's vestry, and on the south a morning chapel. Leaded lights, filled with tinted cathedral glass, illuminate the church, the east window having five lights, with open tracery, spandrels, and elegant crisped work at the crown of the arch. The roof is open timbered. The estimated cost of the new building is £8500.

Correspondence.

THE "BITTER CRY" OF THE OUTCAST ARCHITECTURAL ASSISTANT.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—After reading the letter of "Provincial Assistant" in your last issue, I feel I cannot abstain from giving my hearty support to his remarks.

My experience proves that architects' assistants have other grievances besides those mentioned by "P. A.," and I should be pleased to assist any practical scheme for removing them.

Of course, there are many architects who treat their employés properly, and in such cases I would ask these assistants to look upon any scheme for the benefit of those less fortunate in a brotherly spirit, and do all they can to support any scheme for their benefit, remembering that it is only by being thoroughly united that any good can be done.—I remain, yours faithfully, "GOTHIC."

Enquiry Department.

SCIENCE AND ART EXAMINATIONS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Would you kindly tell me through your paper the number of candidates who sat at the recent examination for Honours Building Construction, and also the number that passed in the final stage?—Yours truly, H. T. H.

You are rather vague in your question. If you are referring to the examination of the Department of Science and Art, we are not aware that the information you ask has yet been published. Write to the Secretary, Department of Science and Art, South Kensington Museum, London, S.W.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Will you kindly state a few useful books suitable for an architect's apprentice and oblige, "SECTOR."

You should possess Gwilt's "Encyclopædia of Architecture," and Hurst's "Architectural Surveyor's Handbook." "Notes on Building Construction" (Rivington) is the standard book on its subject. It is rather expensive, but as it is progressive you may get the four volumes separately as you need them. W. H. Leeds, "The Orders;" T. Talbot Bury, "The Styles of Architecture;" and Bloxham's "Principles of Gothic Ecclesiastical Architecture," would fill all your needs for some time in their respective subjects.

DETAILS OF CONSTRUCTION.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Would you kindly give me a reply, through your valuable paper, to the following queries?—Are there text books published, or information given in any other way on details of construction, which are not dealt with in the standard works on the subject, say Rivington's. Also if details of the construction of shop fronts in buildings can be obtained in any way? Trusting you can find space to give me an answer, I am, &c., "CONSTRUCTOR."

Books dealing with special subjects can, of course, give more particulars of detail and more alternative methods than can find place in a volume which treats generally on the whole subject of building construction. We know of no book on the construction of shop fronts, and think it most improbable that any such book exists. If you do not know someone who has experience in this subject, your only chance would be to search the indices of the professional journals, and the proceedings of Architectural Societies. The following works dealing with special phases of building construction may be recommended:—T. Laslett, "Timber and Timber Trees;" E. W. Tarn, "The Science of Building;" W.

Griffiths, "Trusses of Wood and Iron;" F. Campin, "Mechanics of Construction."

BRIDGE CONSTRUCTION.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Will you kindly inform me through your Enquiry column the names of the authors and publishers of some good books (well illustrated) on the design and construction of: No. 1—Stone and Brick Bridges No. 2—Iron and Steel Bridges.

—Yours truly,

October 22nd, 1898.

F. J. D.

Bridge Building is a subject that cannot be satisfactorily learned from text books, though a good ground work may be obtained from the books we quote below. In any case the best and most profusely illustrated works are very costly. The first subject is dealt with in any good work on civil engineering, such as: "Civil Engineering," by Professor Rankine, 16s., Chas. Griffin and Co.; or "Civil Engineering," by H. Law, M.I.C.E., and D. K. Clark, M.I.C.E., Weale's series, 6s. 6d., Crosby, Lockwood and Son; in addition get "A Practical and Theoretical Essay on Oblique Bridges," by Watson Buck, M.I.C.E., 12s., Crosby, Lockwood and Son. For the second subject, the following works are recommended:—

"Bridge Construction," by Professor Fidler, M.I.C.E., 30s.; "The Design of Structures," by S. Anglin, C.E., 16s., published by Chas. Griffin and Co.; "Iron Bridges of Moderate Span," by H. W. Pendred, 2s.; "Iron and Steel Bridges," by F. Campin, C.E., 3s. 6d.; "Tubular and Girder Bridges," by G. D. Dempsey, 2s., Weale's series. Crosby, Lockwood and Son.

THE ORDERS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I should be glad if any of your readers would inform me through the medium of your columns the best book on the Orders alone, containing the best methods of drawing them out.—Yours faithfully, "PUPIL."

Birmingham.

We would advise you to get Mr. R. Phené Spiers' book, published by Batsford. It consists of large quarto lithographed plates of the best Greek and Roman examples, showing ornament and mouldings drawn to a larger scale. As the plates have been drawn (not engraved), it constitutes also a lesson in draughtsmanship. There is descriptive letterpress. If you need more detailed information of any particulars, you will find them excellently stated in Sir William Chambers' "Civil Architecture" (Ed. Gwilt). The book, we believe, is out of print, but any good public library should contain it. Or you may get "The Orders," by W. H. Leeds.

CONCRETE SLABS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Would you kindly answer the following?—What would be a fair load (distributed) per sup. foot for a concrete slab 3in. thick to carry, composed of one part Portland cement to two and a half parts crushed granite, covering a space 2ft. 10in. wide, after having been made three months?—Yours truly, E. K.

Concrete varies so greatly, not only according to its nominal constituents, but as to their quality and the manner in which they are mixed, that nothing except direct experiment upon a specimen block, made exactly like the blocks to be eventually used, is to be relied upon. We fear we cannot take the responsibility of giving a more definite answer.

ACTIVE progress is being made with the work of overhauling Kensington Palace and preparing it for opening to the public in accordance with Her Majesty's wishes. The building, however, was proved to be in so bad a condition of repair that a good deal more time will be required to complete the preparation than was at first anticipated. In all probability next summer will be well advanced before it will be possible to admit the public.

Under Discussion.

ARCHITECTURAL ASSOCIATION OF IRELAND.

Mr. R. M. Butler, the hon. secretary of the Architectural Association of Ireland, read the report of the committee at the opening meeting. The report set out:—In considering the work of the session as a whole, there must of necessity be many imperfections and defects in the working out of a scheme such as the formation of an architectural association, but regard should be had to the fact that great difficulties exist during a first session, which require the expenditure of much time and energy to overcome. The hearty support accorded to your committee by both the senior and the junior members has been such as to greatly encourage them, and leads them to anticipate for the association a more extended field of usefulness and mutual benefit in the future. Your committee have had under consideration the question of persons who are not members of the architectural profession engaging in practice. They have unanimously decided that any such person offering himself for membership under the second sentence Clause 4 of the Article of Constitution, as defined in the Form of Application B, covenants, *ipso facto*, not to engage in architectural practice.—The report was adopted.

THE FUNCTIONS OF THE HOUSE PAINTER.

At the fifth annual Convention of the National Association of Master House Painters of England and Wales, held in Liverpool, the President, in the course of his opening address, said the end and aim of the Convention business was the bettering of their industrial position, the stimulating of their artistic ideas, the improvement of their relations with the public and with kindred industries, and the dissemination of a truer conception of the importance to the public in a sanitary, æsthetic, and protective sense, of the ancient handicraft of which the members of that association were exponents. In his way the sanitary painter was even more important than the sanitary plumber. The plumber's sanitary appliances were located in a few well-defined places in a building, and the application of his skill was limited accordingly, whereas the painter's sanitary work extended from cellar to garret, and almost embraced every yard of the interior surface of a building. If the public only realised what white sepulchres they went into in the shape of rented dwellings, offices, shops, and the like, in which this elementary sanitary work had been grossly neglected, they would insist upon every master house painter being registered or licensed like any doctor, lawyer, or other professional man, whose work was of such general public importance as to require a public certificate of competency to entitle him to practice. The modern system of competitive tendering for sanitary work of any kind was simply a premium on scamping. It was no uncommon thing for painting tenders to vary 100 per cent. for what purported to be identical work, and the public generally, failing to recognise any other measure of value than that of price, accepted the lowest tender. Not less important in its bearing upon the comfort and happiness of the public was the house painter's work from the æsthetic side. The important effect of environment upon animals generally, and upon man in particular, was well recognised by scientists, and although their works dealt mostly with the effects of climatic and geographical environment, the principles they had laid down were well recognised as applying to social and æsthetic environment. The speaker concluded by saying that whether they considered the house painter from the point of view of the preparation of the interior of a dwelling, or from the colour treatment of the dwelling, or from that of the protection of the exterior of the dwelling, he was, and ought to be, in all his work a sanitary expert in the highest and broadest sense of the word, and enjoy a high degree of consideration from the public accordingly.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BELFAST.—Accepted for the construction of a covered concrete reservoir at the Horseshoe, Ballysillan. Mr. Acheson Ferguson, surveyor, 35, Royal-avenue, Belfast:—

Jacob W. Lester, Milewater-road, Belfast ... £9,358

CONTRACTS OPEN.**JAMES ALLEN'S ENDOWED GIRLS' SCHOOL.**

EAST DULWICH GROVE, S.E.

TO BUILDERS AND CONTRACTORS.

The Governors of James Allen's Girls' School are prepared to receive TENDERS for considerable ADDITIONS and ALTERATIONS to the School premises situated as above.

Working drawings and form of Contract may be seen at the Office of the Architect to the Governors, ARTHUR J. GALE, Esq., 4, Serjeant's Inn, Fleet-street, E.C., between the hours of TEN a.m. and FIVE p.m., on or after NOVEMBER 17th next.

Builders wishing to Tender must send their names and addresses to the Office of the Architect before TWELVE o'clock noon on NOVEMBER 21st.

Each application must be accompanied by the deposit of a £5 Bank of England Note, which on the receipt of a bona-fide Tender will be returned.

Copies of the bills of quantities and form of Tender

will be sent to such applicants on NOVEMBER 24th next.

Tenders must be delivered to the undersigned at his office, Dulwich College, S.E., at TWELVE o'clock noon, on or before DECEMBER 1st next.

Tenders will be received only on the printed form, under seal, and addressed to the Chairman of the Governors.

The contractor will be required to enter into a bond of £1000 with two sureties for the due performance of the contract, and no work will be ordered under the contract until such bond has been duly executed.

The Governors do not bind themselves to accept the lowest or any Tender.

By order,

J. WATCHURST,

Clerk to the Governors.

RECONSTRUCTION OF SANITARY ARRANGEMENTS at Rinfrew-road Work-house.

The Guardians of the Poor of the Parish of Lambeth hereby invite TENDERS for this Work.

Tenders, which will be received only on the printed

form, sealed, and endorsed "Tenders for Sanitary Arrangements," must be delivered at the Offices of the Guardians, Brook-street, Kennington-road, not later than TEN a.m. on WEDNESDAY, NOVEMBER 30th next, and will be opened at the Board Room at NOON on the same day, when all persons Tendering, or their authorised agents, must be in attendance.

A form of Tender may be obtained, and the drawings and draft of contract may be inspected at these offices on any day between the hours of TEN and SIX. Specification and bills of quantities will be supplied on payment of 10s., which will be returned to each person sending a bona-fide Tender.

No Tender will be considered which is not accompanied by the bills of quantities fully priced and monied out.

The Guardians do not pledge themselves to accept the lowest or any Tender.

By order of the Guardians,

W. THURNALL,

Clerk.

Guardians' Board Room and Offices,

INTRODUCTION OF NON-FLAMMABLE WOOD INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to

Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"IOWA" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.

"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known
colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING,
(each of which is over eighteen stories high).

"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company
by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,
2, Army and Navy Mansions, Victoria Street, London, S.W.

Protective Metallic Coatings for Iron and Steel.*

By SHERARD COWPER-COLES,

Assoc. M. Inst. C.E., M.I.Mech.E., M.Inst.E.E.

(Continued from page xcix.)

HAVING briefly pointed out the importance of galvanising, and explained the nature of the results obtained, the author will now endeavour to give some idea of the process itself, more especially of electro-zincing, and a description of the plant employed. The first care in electro-zincing is to have a properly prepared surface; all traces of grease and rust must be removed. Machined work, which is usually very greasy, should be immersed for about half an hour before pickling in a hot solution of caustic soda, about $\frac{1}{2}$ lb. to the gallon of water. The work should then be placed in a hot pickle containing about 1 per cent. of commercial sulphuric acid. The author has found that a considerable saving of acid can be effected by placing a false bottom in the pickling tank so as to catch the heavier portion of scale as detached, the tray being removed after the day's work, and the scale collected. About 50 tons of acid are required for every 1000 tons of sheets such as are used for roofing purposes. The Admiralty specify that

ALL STEEL STEAM PIPES,

boiler and collector tubes, and all plates for boilers, are to be pickled in a liquid consisting of 19 parts of water and 1 of hydrochloric acid, until the black oxide or scale formed during the manufacture is completely removed. Plates should be placed in the bath on edge, and not laid flat. When taken out of this dilute acid all the surfaces are to be well brushed and washed to clean off the loose scale. They should then be placed in a bath filled and kept well supplied with fresh water or be thoroughly washed with a hose as may be found necessary, and then placed on end to dry. The effect of pickling and rusting on the strength of iron and steel has been shown by Herr A. Ledebur, of Berlin. Rails, joists and bars were subjected to various conditions: (1) in the condition as delivered; (2) after exposure for purposes of rusting; (3) zinc (galvanised) and tested at once; (4) galvanised and exposed for a time; (5) pickled in acid and immediately tested; (6) pickled and kept for a time in a dry place. The pickling was done in sulphuric acid diluted with water in the proportion of 1 to 100. The samples were tested for transverse, tensile and compressive strains, and under a falling weight, these experiments being made on the same sample for each of the six conditions.

THE BENDING TESTS

with wrought iron joists showed substantially the same for all the conditions, the maximum loads carried showed differences, being highest in the natural condition and lowest when freshly pickled. Rusting also produces a diminution of strength more apparent in the galvanised articles than in those not galvanised. In those instances where the specimens were broken, the diminution in strength is said to be very decided in the pickled, and perceptible in the rusted specimens. The figures are: breaking strain under condition 1, 35 tons; under condition 2, 33.9 tons; under condition 4, 32.7 tons; under condition 5, 29.6 tons; under condition 6, 30 tons. The steel specimens showed results which follow the same law. Mr. W. Thompson, in a paper read before the Manchester Association of Engineers, states that "When iron is placed in acid some of it is dissolved and hydrogen liberated. The gas is supposed to be of the nature of a metal, and as such it combines with and forms an alloy with the iron, which becomes quite brittle until the iron is heated and the hydrogen liberated, when it regains its tenacity. If a piece of wire be broken when it has thus become alloyed with hydrogen,

and the end wetted, the bubbles of gas may be seen passing rapidly through the water." This condition of things was observed and investigated by Mr. W. Johnson, B.Sc., of Manchester, and afterwards by Professor Osborne Reynolds, F.R.S. The latter showed that if an iron tube be closed at one end and filled with oil and placed in an acid solution, hydrogen is liberated from the outside, which passes through the wall of the tube, displacing the oil, so that the gas may be thus easily collected from the inside of the tube. There is a possibility, therefore, that

WHEN IRON IS RUSTING,

the hydrogen liberated may similarly combine with the iron and render it brittle, or reduce its strength, and this is a question of much importance to engineers. Some interesting experiments in regard to the decrease in the strength of iron after being pickled and galvanised have recently been reported. A dozen eye-bolts, all precisely alike so far as could be perceived by external inspection, were carefully selected. Six of these eye-bolts were laid on one side, and the other six sent away to be galvanised. A testing machine was at hand, and six bolts were connected together, one galvanised bolt being connected to each of the ungalvanised ones. Then they were placed between two pieces of iron and the nuts screwed up until the eye-bolts broke. Invariably it was found that the galvanised eye-bolts were the ones to break; not in any instance did the ungalvanised ones give way. Boat builders also state that galvanised iron is "rotten." They say that when great strength is required they select the iron and have the fittings forged by a good smith, but do not have them galvanised. Galvanised iron is frequently used in places

WHERE LITTLE STRENGTH IS REQUIRED,

but where rust would be objectionable. For this purpose, galvanised iron leaves nothing to be desired, but where the full strength of the material is required, and rust stains are objectionable, the object may be attained by cleaning them by the sand blast process, and afterwards coating them by the cold galvanising process; both of which methods are becoming well known and largely used for the above purposes. Sand blasting is often used instead of pickling, and for many purposes it is found to give better results, especially for cast-iron work, from which it is very difficult to remove the last traces of acid. The cost of sand blasting per square foot, under the most favourable conditions, including the cost of labour, sand, and power, is one-tenth of a penny, but the actual cost varies considerably with the nature of the work. When using quartz sand of the best quality the loss is about 10 per cent. each time it is passed through the machine; the loss when using chilled iron sand is very small, the waste of the material replacing more than nine-tenths of the apparent loss. In Government shipyards, where most of the iron has to be freed from scale, a small addition to the staff is sufficient to enable the same amount of work to be galvanised. Hitherto the great difficulty experienced in electro-depositing zinc has been to keep the electrolyte in working order, as zinc anodes, whether cast, rolled, amalgamated, or in the form of granulated zinc, fail to keep the solution up to its normal strength.

THE ADDITION OF ZINC OXIDE

has been suggested, but the cost is found to be too great, and at present a pure oxide cannot be attained at a reasonable price. The author has found the addition of zinc dust to the electrolyte to be the only practical method of accomplishing this end. The zinc dust, which contains about 75.5 per cent. of metallic zinc and usually a trace of cadmium, is cheaper in the first cost than virgin spelter, the use of it also considerably reduces the waste of zinc, as practically the whole of it is consumed. Zinc dust, or tultz, is a greyish amorphous substance, and must not be confused with zinc oxide; it is obtained as a sublimed product in the flues of the zinc-smelting furnaces. Small quantities of zinc dust are placed from time to time in the regenerating tanks, which are

connected to the depositing vats by a system of piping, the electrolyte flowing into the bottom of the depositing tanks by gravity, the lighter liquid being drawn off over a sill at the end or in the corner of the vat. It is found very advantageous to mix the zinc dust with sand or coke and thus form a filter-bed, if the zinc dust is allowed to get into the electrolyte it is found to increase the electrical resistance. A zinc sulphate solution containing 12.59 free acid after passing through a filter-bed containing 10 per cent. zinc dust, was found to contain only 0.68 per cent. free sulphuric acid. To obtain good bright deposits of zinc, it is necessary to keep the solution as free as possible from impurities; if the electrolyte is allowed to get too acid the zinc will be dark in colour and rough. The work to be zincd is secured to dogs fitted to cross bars, which rest on copper strips attached to girders carrying the anodes. This arrangement effects a considerable economy in the first cost of the plant. It has also the advantage of allowing the electrodes to be brought much nearer together than would otherwise be the case. The heavier classes of work are transferred from the vats

BY AN OVERHEAD CARRIER,

the lighter by a trolley running on rails. A special feature of the electrical process is that plates of very large dimensions can be speedily zincd on one or both sides, which is a matter of some importance now that plates of great length are being put in the straight run of steamers' hulls. The frames of such craft as torpedo-boat destroyers can also be galvanised after riveting up. The first cost of a galvanising plant having a capacity of 6700 gallons (30ft. by 6ft. by 3ft.) is about £600, which is but little more than that of a hot galvanising plant having a bath capacity of only 10ft. by 4ft. by 4ft. 6in. outside dimensions. Such a hot bath would hold 28 tons of zinc, which, at £15 a ton, amounts to £420. To keep this large quantity of zinc in a molten condition entails a heavy expenditure in fuel, the thickness of the iron bath averaging more than 1in. Moreover, the iron baths are a constant source of annoyance and expense, as the iron is dissolved by the zinc, resulting in the ultimate destruction of the tank. Table No. 2 gives the output of work of various sizes of electro-zincing plants. The cost of electro-zincing varies with the nature of the work to be zincd. The following is an estimate of cost of zincing 20 tons of plate in a working week of fifty-two hours, the average thickness of plates being $\frac{1}{8}$ of an inch, and the thickness of zinc coating one ounce per square foot:—

	£	s.	d.
Labour, piecework, at 1s. per cwt ...	20	0	0
Incidental expenses, 15 per cent. on labour ...	3	0	0
Yard labour, 10 per cent. on labour...	2	0	0
Zinc, 448lb. at £17 per ton ...	3	8	0
Royalty ...	3	9	8
Electrical energy, at 1d. per E.M.F. ...	2	18	0
Pickling, at 5s. per ton ...	5	0	0
Rent of building, at £2 per week ...	2	0	0
Interest on capital ...	2	17	8
Depreciation of plant... ..	3	17	0
Total... ..	£48	10	4
Cost per ton... ..	£2	8s.	6d.

Both pickling and hot galvanising have the disadvantage of reducing the strength of wires, and of distorting and rendering brittle iron and steel of small section. By exposure to the lowest working temperature of the hot galvanising bath (which averages some 1000deg. F., the fusing point of zinc being 775deg. F.), steel wire of high breaking strain has its hardness, and consequently its ultimate tensile strength and elongational efficiency, reduced by as much as from 5 to 10 per cent. by the drawing of the temper and the formation of an iron zinc alloy on the surface of the steel. It is the practice, when coating steel wire, to keep the bath of molten zinc at as low a temperature as possible, and to run the wire through at a high rate of speed. But these combined causes lead to a considerable waste of zinc by reason of the rapid solidification of the metal on a comparatively cold wire, and they also conduce to the ready breaking or

* A paper read before the Society of Engineers, on October 3rd, 1898.

cracking off of the covering metal on bending or twisting, owing to the difficulty with which molten zinc of low temperature adheres to the steel except after prolonged contact. In some cases the wire on leaving the bath is wiped between asbestos rubbers, but steel thus treated is found to resist corrosion only for a short period.

THE PROCESS OF HOT GALVANISING

is necessarily slow, because the time of passing the wire through the bath is fixed by the fact that the temperature of the iron must be raised to or approximately to that of the spelter. The speed at which a No. 12 wire generally travels is from 50ft. to 60ft. per minute. Experiments are now being made with dipping the coils or bundles of wire in a bath of molten zinc and then placing the coil in a centrifugal machine to remove the excess of metal. Many attempts have been made to electro-zinc wire, but until recently it has not been found practicable to produce a wire capable of withstanding more than one immersion in a copper sulphate solution. Most manufacturers have ceased to galvanise the best classes of steel wire (which cost some £35 per ton) on account of the great risk there is of rendering it worthless. This is unfortunate, for corrosion is found to be very marked on the inner strands of wire rope, and the advisability of protecting the steel is unquestionable. Electro-zincing does not reduce the tensile strength or increase the elastic fatigue of steel wire, even in wires having a tensile strength of 170 tons or more per square inch, such as are used in the manufacture of pianos. The zinc coating put on by the hot process is also uneven, and the increased weight is often a matter of consideration.

THE THICKNESS OF THE COATING

can only be varied within narrow limits, the minimum weight of zinc being about 1½oz. per square foot, the maximum 3oz., except when the molten zinc is raised many degrees above the most economical working temperature, and the articles are removed gradually from the bath so as to give the zinc time to drain off before getting chilled, or in the case of thin sheets and wires which are capable of having some of the zinc being squeezed or wiped off by rollers or other suitable mechanical means to reduce the amount of zinc to about ½oz. per square foot. A galvanised sheet of about 24-gauge was found to have a coating of zinc amounting to 8 per cent., the weight of zinc per square foot being 1·04oz. Excess of zinc has, as already observed, been removed from galvanised wire by passing it through asbestos rubbers, but wire thus treated soon rusts, as it is found in practice impossible to regulate the thickness of the zinc, the result being that an iron zinc alloy is formed on the surface of the iron and no true coating of zinc. The weight of metal on galvanised sheets or terne plates is usually ¾oz. per square foot. Wires can be coated with zinc by electro-deposition to a thickness of $\frac{1}{1000}$ of an inch, or an increased diameter of $\frac{1}{1000}$ of an inch, capable of withstanding eight one-minute immersions in a saturated solution of copper sulphate. A wire $\frac{1}{16}$ of an inch in diameter with a total thickness of $\frac{1}{1000}$ of an inch of zinc applied by the electro process will stand repeated bending round a bar lin. in diameter without exhibiting any signs of peeling or cracking. The vat for the

ELECTRO-ZINCING OF WIRE

is constructed of wood and lined with sheet lead. Wood covers are provided, which are also faced with lead and fitted with counter-weights so that they can be readily lifted for the purpose of cleaning the vat or inspecting the wires under treatment. The covers when in position form part of the anode, making electrical contact with the ridges, and thus forming a circular lead anode around each wire. The solution is circulated rapidly through the plating vat and passed into tanks supplied with zinc dust, where it is revived. Contact brushes, provided with weights or springs, press upon the wires in the spaces provided between two covers, collect the electric current, and at the same time burnish the zinc deposit. Another form of burnisher

consists of agate rollers, which are mounted on carriers capable of turning on centres. The carriers are arranged to turn on guides so as to respond to any unevenness or alteration of position of the wires; the guides carrying the rollers are pressed together by rubber bands or springs to give the necessary pressure for burnishing. To economise space the swifts are so arranged as to carry two coils of wire. Each swift is provided with two drums mounted so as to turn upon a spindle, the lower drum having a flange for supporting the lower coil of wire, there being between the drums, and secured to the spindle, a collar provided with pins or supports for carrying the upper coil of wire. The pins or supports are made so that they can be easily removed or turned out of the way. When the coil on the lower drum becomes exhausted, a coil from the upper drum, if unexhausted, can be allowed to descend on to the lower drum by removing the pins or supports, which can then be again inserted in the collar, and a fresh coil or coils placed on the upper drum.

VARIOUS ELECTROLYTES

have been suggested and experimented with from time to time. Elsner has experimented with ammonium chloride solutions, zinc lactates have also been tried. An electrolyte from which good bright deposits can be obtained is composed of 40oz. of zinc sulphate of 1·1770 sp. gr. (=19 per cent. of crystallised zinc sulphate), and 5oz. of ferrous sulphate to the gallon of water, the anodes being of lead. Ferrous sulphate (protosulphate of iron $2\text{FeSO}_4 + 2\text{H}_2\text{O}$ when exposed to the air oxidises into ferric salts ($\text{FeSO}_4 + 3\text{H}_2\text{O}$), especially when free acid is present. Two atoms of iron in the ferric state require 3 molecules of sulphuric acid to dissolve them and form sulphate, whilst in the form of ferrous oxide only 2 molecules of the acid are required; the free acid is thus consumed. The electrolyte when in good working order has a reddish-brown colour. The yellowish tinge of a freshly prepared zinc sulphate solution to which has been added ferrous sulphate, is due to hydrated ferric oxide in suspension, the solution retains the same colour after having been passed through a filter. A rusty brown precipitate of hydrated oxide is obtained on adding ammonia, and a deep blue precipitate with red prussiate (potassic ferricyanide). Potassic ferricyanide gives no precipitate from ferrous solutions, but potassic ferrocyanide gives a bright Prussian blue precipitate. The hydrogen set free at the cathode converts the yellow ferric sulphate into ferrous sulphate (green vitriol or copperas), and the oxygen set free at the anode tends to the formation of basic salts, some of the iron being converted into peroxide. A saturated solution of zinc sulphate at 10° C (density = 1·422 = 89·6oz. of $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$ per gallon), has a specific resistance of 33·7; and about half saturated (density = 1·27 = 44·8oz. of $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$ per gallon), the specific resistance being only 28·5 which is about the minimum value.

EXPERIMENTS

have recently been made with depositing zinc from orthophenol—sulphurous metaphenol—sulphurous acid and paraphenol—sulphurous acid. Messrs. Siemens and Halske have recently taken out a patent, in which they claim to overcome the formation of zinc sponge during electrolysis by the prevention of the supposed action of the zinc hydride ZnH_2 , and the nascent hydrogen in causing the production of zinc sponge by mixing with the neutral or slightly acid sulphate of zinc solutions free halogens, or such inorganic or organic halogen compounds (hypochlorous or hypobromous acids, or chlorhydrins of the glycols), which under reduction give off their halogens to the nascent hydrogen. Dr. Kiliani, of Munich, who was the first to recognise the importance of electro-motive force in the separation of metals, found that during the electrolysis of a solution of zinc sulphate of 1·33 sp. gr. = (76 ounces $\text{ZnSO}_4 + 7\text{H}_2\text{O}$), the anodes and cathodes consisting of zinc plates, the evolution of gas was greatest with a weak current and ceased when on one square centimetre of electrode surface 3 milligrammes of

zinc were precipitated per minute, that is 25·833 grains per square foot per hour. From a 10 per cent. solution the deposit was best with a current yielding from 4 milligrammes to 0·2 milligrammes per square centimetre per minute, or 3·46 to 1·78 grains per square foot per hour. From very diluted solutions the zinc was always obtained in a spongy condition, accompanied by evolution of hydrogen, with a strong current the deposit was very firm.

WITH WEAK CURRENT,

and from a 1 per cent. solution, oxide of zinc was also precipitated even with an electro-motive force of 17 volts, when only 0·0755 milligrammes of zinc was deposited per minute on one square centimetre of cathode surface (=·62 grain per square foot per hour). The same authority found that 2·35 volts were necessary to decompose zinc sulphate. Electrolytes made by adding caustic potash or soda to a suitable zinc salt have been found to be unworkable on a commercial scale, the zinc oxide formed on the surface of the anode being insoluble in caustic potash or soda. A solution of cyanide of potassium and zinc cyanide is also impracticable, both on account of cost and the insolubility of the anode. The same remarks apply to a potassio-tartrate solution, patented in 1855 by Watts, and made by dissolving 200 ounces of cyanide of potassium in 20 gallons of water, to which he added 80 ounces, by measure, of strong liquid ammonia. With this solution he filled large porous cells, and put them upright in a vessel containing the bulk of the solution. He placed strips of copper in the porous cells and a large zinc anode in the outer vessel, and connected them up respectively with the negative and positive poles of a battery, and allowed the current to flow until

ZINC HAD BEEN DISSOLVED

to the extent of 60 ounces in all, or 3 ounces to each gallon of solution. To this solution he added 80 ounces of carbonate of potash by dissolving it in portions of the solution at a time, and returning the dissolved salt to the bath. A fair coat of zinc is obtained with difficulty from zinc chloride and from the fused salt. One of the great impediments to the reduction of zinc on a commercial scale has been the tendency of the zinc, after depositing in a sound state for a short time, to come down in one of the varieties of the spongy deposits. The following is an analysis of zinc sponge obtained from a zinc sulphate solution containing a small quantity of ferrous sulphate:—

(To be continued.)

A new institute has been erected in connection with St. Paul's Church, Lower Teams, Gateshead. The cost of the building was £630. It has been built by Mr. John Anderson, of Newcastle, from designs by Messrs. Oliver and Leeson.

The temporary wire gates at the several jury entrances leading from the central hall of the Royal Courts of Justice to the various courts on the next floor, which were erected during the dynamite scare some years ago, have now been replaced by handsome permanent wrought iron gates, the design of which is in accordance with the character of the other ironwork of the building.

PRACTICAL CARPENTRY AND JOINERY.*

BY GEORGE ELLIS.

XI.—STAIRS.

(Continued from page ci.)

THE rise and going of the stairs must, of course, depend upon the situation, but should be proportionate to each other. Taking $5\frac{1}{2}$ in. as a standard rise for a 12 in. going, if $\frac{1}{2}$ in. be added to the rise, for each inch the going is reduced, and *vice versa* a good proportion will be kept. Another good method is to make the sum of two rises, added to the going, equal twenty-three; and to find the rise when the width of tread is given, subtract the given width from twenty-three, and half the remainder will be the rise. To find the exact rise of any stair when the total height is known, divide the height of the story in inches by the proposed rise; if the result be fractional, divide the height by the quotient, neglecting the fraction, the result will give the rise required—e.g., a story is 11 ft. 4 in. high, equals 136 in. divided by six, the proposed rise, gives $22\frac{2}{3}$; again, divide 136 in. by twenty-two, omitting the fraction, we obtain $6\frac{2}{3}$, practically 6 $\frac{1}{2}$ in. bare as the exact rise, with twenty-two steps, including the landing. Wall strings (when of deal) should not be less than $1\frac{1}{2}$ in. thick, and outer strings $1\frac{1}{2}$ in. When

FIG. 174. METHOD OF FORMING AND FIXING A WREATHED STRING.

depth of $\frac{1}{2}$ in. to form a stop for the riser, which is glued against it, and secured with

FIG. 173. DETAILS OF CUT AND BRACKETED STAIR.

these are cut, $1\frac{1}{2}$ in. is the minimum, as the available strength of the string can only be equal to the uncut portion, the width of which is determined by the depth of carriage to be employed, and plus the thickness of plastering (see Fig. 173). The verge or top side of wall string varies according to taste, but is usually about 2 in., measuring square from line of nosings. The thickness of treads must depend upon the amount of wear they are likely to be subjected to, and also to some extent upon the material. Teak, for instance, will not need to be so thick as red deal, from $1\frac{1}{2}$ in. to $2\frac{1}{2}$ in. is the usual range; from 1 in. to $1\frac{1}{2}$ in. is sufficient for the risers, as they are not called upon to resist much wear. The nosings should project from the risers an amount equal to the thickness of tread, and the scotia moulding sunk in a groove to a

angle blocks and screws, as shown in the detail Fig. 173. Treads should always run under the

FIG. 173A. PLAN OF A CUT STRING, ETC.

risers, and be slot screwed to the latter, to allow of shrinkage; tonguing the riser into the lower tread is not advisable, as the shrinkage of the tread distorts the riser. The grain of winders should run parallel with the nosing. When each is made up it is housed $\frac{1}{2}$ in. into the string, and glued and wedged thereto; the whole of the fliers in a flight are inserted in the strings, and the lower newel attached, and the stairs erected, commencing at the bottom flight. The winders are inserted afterwards from the back, notches being cut out of the newel to receive them, where they are fixed by nailing. In close string stairs the balusters are stub tenoned into the capping, as shown in Fig. 168, but in cut strings they are dovetailed into the ends of the treads, and covered by the return nosings (see Fig. 173). The treads rest upon,

and are flush with, the outside of the string, the nosing running over to mitre with the return piece. The risers are cut to mitre with the front of string either in the solid as at A Fig. 173, or by lap mitre as at B. When brackets are used the lap of the riser must be long enough to mitre with them, see B in plan of same Fig. The wreath piece for the string of a geometrical stair (see Fig. 174) is formed by first bending a veneer of similar wood to the rest of the string around a cylinder or centre of suitable shape, and then glueing blocking pieces across the back, shaped to fit, and bringing the wreath up to an equal thickness with the string. When dry the back is worked off evenly and canvas glued on, the notches cut for the steps, these being marked on the veneer before bending, as shown in dotted lines in the sketch. The piece is secured to the strings, with tongued joints and counter-wedged keys. In inferior work a cane of suitable size is steamed and bent around the under edge of the wreathed string to form a stop for the plaster and hide the ends of the backing pieces; but in better class work a piece of square stuff is steamed and bent around the cylinder, then worked to shape, and fixed in position. Geometrical stairs, although they are very economical of space, and their curves may be made graceful and flowing, are essentially weak constructively, and should be well timbered to ensure stability. The carriages are birdsmouthed or bolted to the trimmers and pitching pieces, and the latter well wedged into the wall. A spandrel framing under is a great assistance. The open newel stair is the handsomest and most efficient type yet introduced, and given ample room it becomes a most imposing feature in a building. The strings may be open or close, the latter is more in keeping with the style. Newels and balusters should be substantial, and the rails wide and deeply cut, ramping into the newels at each end. The strings should be deep, and may be panelled with good effect. The tenons, of which there should be several small ones, should be short and stout, cut to fit wedging as they drive in, and be double shouldered. Where possible the newels should be continued down to the floor, but when cut should be shouldered and bolted to trimmers. The handrail should be tenoned and housed into the newel, and may be secured by a screw-bolt, which is preferable to pinning, as the latter shrinks and becomes loose and unsightly. The landings should be glued up in one piece, and secured to the joists with buttons. The strings of circular well stairs are made in two ways, both, however, needing a cylinder or mould made to the plan of the string and of sufficient length to build a section upon. In the first method the string is made up of several laminae, steamed

FIG. 176. PLAN OF BULLMORE STEP.

in position with wedges and screws. The blocks are built up in three thicknesses, with the grain of the pieces crossing to strengthen them. A method of setting out a scroll or curtain step is shown in Fig. 177, with an enlarged diagram of the centres in Fig. 178. Determine how far the scroll is to project, let A D equal the width, divide it into eight equal parts, make A B at right angles with A D equal to one part; join B D, upon the centre of A D describe an arc touching B D and cutting A D in C; from C as centre and C D as radius describe the quadrant D E, draw the line E H at right angles with D B, join C E, draw a line from B parallel to A D, cutting C E in 2, this gives the second centre of the scroll, with 2 as centre and 2E as radius describe quadrant E B, from C draw a line through

the intersection of EH and BD, produce it to cut B2 in 3, this will be the third centre; to obtain the fourth, draw a line from 2 through the intersection, and produce it to meet a line drawn from 3 parallel to CE, the remaining centres will be found by drawing lines parallel to those previously drawn, and will be obvious on inspection of the diagram. The scroll having been once drawn, its direction may be changed, or turns added, by producing the larger quadrant, or drawing straight lines where desired tangent to the curves, as shown in the dotted lines of Fig. 177. In Fig. 179 is shown the method of obtaining the true section of a mitre cap, for a dogleg stair when the section of the handrail is given. Draw the section of rail full size, draw the plan of the widest part, and a plan of the cap, of the size desired, next draw the plan of the mitre, the nearer this is drawn to the centre of the cap the thinner the latter will be; divide the profile of the rail into any number of parts and draw lines parallel to the sides of the rail, from these points to the mitre lines; draw a line through the centre of cap at right angles with the plan of rail, from the centre, with the intersections on the mitre line as radii, describe arcs cutting the diameter in 1, 2, 3, 4, 5, 6, 7, from these points erect perpendiculars to the diameter, and upon them set off the various heights, and intersections of the profile, occurring on the corresponding perpendicular of the rail, through the points thus found trace the curve.

At a special meeting of the Yarmouth Town Council, it was resolved to establish a system of electric trams in the town at a cost of £40,000. The tram route comprises eight short sections through central parts of the town, and a double line along the Marine Parade. The total length of tramway will be 3½ miles, and the corporation will supply motive power from its own generating station. The overhead trolley system of traction has been adopted.

Messrs. Morrison, Ingram, and Co. Ltd. announce that they have reduced their trade discounts on bath and brass sections of their catalogues $2\frac{1}{2}$ per cent., and that all nett prices of these goods are advanced 5 per cent.

five years ago, started an electric light installation, which at the time was thought to be a large one, as it consisted of 20,000 sixteen candle-power lamps. It was thought that this would last for a decade at least, but it did not last for twelve months. Since then there has probably been 70,000 lamps brought into use.

Property and Land Sales.

Plasnet Hall Estate.—Fifteenth Sale of Freehold Building Land, close to the Romford-road.

MESSRS. TUCKETT and SON are instructed by the Trustees of the late John Gurney, Esq., to **SELL by AUCTION**, at the Princess Alice, Forest-gate, on **THURSDAY EVENING, NOVEMBER 24th**, at **SIX o'clock**, 20 very prominent **SHOP PLOTS**, in the best part of White Post-lane, and 64 Plots for private houses, having 16ft. frontages to the extension of Halley-road. Immediate possession. Free conveyances. Deferred payment. Interest 4 per cent.

Particulars of Messrs. **YOUNG, JONES, and Co.**, Solicitors, 2, St. Mildred's-court, E.C.; or of Messrs. **TUCKETT and SON**, Land Agents, Surveyors, &c., 2, Basinghall-street, E.C.

FAIRMILE PARK, near Cobham, Surrey.—A **FREEHOLD BUILDING ESTATE** of about 40 acres, with possession.

MESSRS. DRIVER and CO. have received instructions to offer to **AUCTION** at the **MART**, Tokenhouse-yard, Lothbury, **NEXT SPRING** (unless previously sold by private contract), the above property, situate in a favourite residential district, about a quarter of an hour's walk from the Oxshott and Fairmile Station, and about a mile and a half from Cobham Station. The estate comprises Building Land, ripe for development, the higher portion (sloping to the south) possessing charming views over the intervening country to Epsom Downs; and a Residence known as "South Lodge," with stabling and garden; Eight small Villas, some Cottages, and the "Griffin" Beerhouse. On a portion of the estate brickwork is being worked, and will be included in the sale as a "going concern."

Particulars and plans, when ready, can be obtained of **CHARLES JUPP, Esq.**, Solicitor, 48, Lime-street, E.C.; and of Messrs. **DRIVER and Co.**, 23, Pall Mall, S.W.

MESSRS. BOYCE and EVENS beg to notify that the **AUCTION SALE** of Timber and Building Materials at Lismore-gardens and Gordon-road, close to Gospel Oak and Haverstock Hill Stations, N.W., as previously advertised, has been **POSTPONED** until **ONE o'clock** this day (**WEDNESDAY**), **NOVEMBER 9th**.—Catalogues on the Premises, and at the Auctioneers' Offices, 92, Hoxton-street, N.

SURREY.—Choice BUILDING ESTATE.

—In a charming district, two miles from Horley station (L.B. and S.C. Rly.) under one hour from London and adjoining a village where are church, shops, and post-office; two miles from Roman Catholic Church.

FOR SALE, a compact and valuable **FREEHOLD PROPERTY** of 53 acres, with a frontage to the main Brighton road of 2000ft., and perfectly ripe for development, with residences of a good class. Prettily timbered. Gas and water mains along the frontage. Would be sold.

Plans and full particulars of the owner's agents, Messrs. **GREEN and SIMES**, Auctioneers and Estate Agents, Blenheim Mansions, Queen Anne's-gate, London, S.W., or Mr. **W. M. LEACH**, Auctioneer and Estate Agent, Crawley, Sussex.

CANNING TOWN, within five minutes' walk of Custom House Station.—A small Freehold Building Estate, comprising a little over six acres, ripe for immediate development.—With possession.

MESSRS. VENTOM, BULL, and COOPER are instructed to **SELL by AUCTION**, at the **Mart**, Tokenhouse-yard, on **TUESDAY, NOVEMBER 29th**, 1898, at **TWO o'clock** precisely, about **SIX ACRES** of valuable **FREEHOLD BUILDING LAND**, comprising the only uncovered land lying between Canning Town Station and the Recreation Ground, and possessing important frontages to the Freemasons and Prince Regent roads; tithe and land tax free.

Particulars may be had of Messrs. **HERBERT SAXELBY and Co.**, Solicitors, 7 and 8, Ironmonger-lane; at the **Mart**; and of the **AUCTIONEERS**, 35, Old Jewry, E.C.

To Builders, Joiners, and others.—Hastings-road, Bexhill.—850 Lots of **BUILDERS' and JOINERS' MATERIALS** and General Stock-in-Trade, nearly new Joiner's Plant, 3000ft. Seasoned Mahogany, Oak, and Teak, Workshop with iron roof, and other effects, which

MESSRS. WOODHAMS and SON have received instructions to **SELL by AUCTION**, at the **JUNCTION** of the **HASTINGS and SIDLEY ROADS**, this day (**WEDNESDAY**), **NOVEMBER 9th** 1898, at **ELEVEN o'clock**.

Catalogues may be had at the Auctioneers' Offices, Havelock-road, Hastings.

By **EDWIN FOX and BOUSFIELD**,
At the **AUCTION MART**,
On **WEDNESDAY, NOVEMBER 16th**, at **TWO**.
By Order of the Trustees of the late Edward Dewick, Esq., and another.

CITY of LONDON.—Walbrook.—FREEHOLD ESTATE, comprising No. 31, Walbrook, and No. 1, Bond-court, covering superficial area of 1790ft., well lighted and possessing the conspicuous frontage on the upper stories of about 38ft., with a depth of 53ft., thus affording scope for the erection of a handsome modern building for commercial or professional purposes. The site is at present covered with the very substantial five-story premises, for many years occupied by Messrs. Herring, Dewick, and Hardy, wholesale stationers, and is thoroughly sound, each floor carrying heavy weights. Possession on completion of the purchase. The property is thus available for occupation in its present form, for investment by re-letting, or for more profitable utilisation by creating a ground rent on building lease, or devoting capital to the erection of such a noble pile as will ensure a large return.

Particulars at the **Mart**; at Messrs. **EDWIN FOX and BOUSFIELD's** Office, 99, Gresham-street, Bank, E.C.; and of the Vendor's Solicitors, Messrs.

VANDERCOM, HARDY, and DOULTON,
25, Bush-lane, E.C.

An Architectural Causerie.

A Drastic Suggestion.

THE tyranny of the Trades Unions has before now formed the subject of much bitter controversy, but the newspaper warfares over that subject bid fair to be quite outdone by the present indictment against the men employed in the building trades. The heads of that indictment are organised idleness of Union men, aggressive and menacing conduct towards non-Union hands, and the alleged practice of suddenly and without warning demanding their wages and leaving a job, to the upsetting of foremen's calculations and to the delaying of contracts. By these means, says "London Architect," the cost of building has gone up by at least 25 per cent. To what, it will be asked, does the building trade owe the state of things now alleged? The answer must needs be that the situation is primarily due to four great compelling causes:—(1) The activity in the building trades which has caused a competition for the services of the bricklayers, plasterers, plumbers, carpenters, and others included in this indictment; (2) the steady growth of an aggressive form of Trade Unionism; (3) the fostering of a species of low cunning, instead of true education, by the Board Schools; and (4) the actual, though practically unnoted, spread of Socialism among the working classes. It will be observed that we are not concerned to defend the British Workman against "London Architect's" attack. Indeed, how could we, having had experience of him, honestly do so? That the plasterer should be the worst among his fellow-malingers, we can well believe, since it must be obvious that the technical details of his craft give him greater opportunities for idling and for wreaking wanton mischief than exists among the others. We are, however, inclined to doubt the "London Architect's" accuracy when he says, in effect, that workmen only work (or pretend to work) when they want the price of a drink. The British workman does not, as a matter of fact, drink nearly so much as he did, say, twenty-five years ago. He still drinks too much; we will allow, but he is not the sort he was wont to be. He is rather of that cold calculating nature which perceives the power of combination. Now combination is a weapon which, it is rather late in the day to observe, is open to use by all. Men have warred with it successfully before now, but so have masters. Let the building trade take its courage in both hands and fight the evils if necessary. No need to call in the tramway men, and the flotsam and jetsam of the labour market, to redress the balance, or to revert to building methods that have had their day and ceased to be. The issue could scarce be in doubt, although the fight may be protracted. The men, locked out for a proved conspiracy of idleness and destruction, could have little sympathy from the public, now that the subject is being so well ventilated in the public press, and they would have abundant leisure to deplore their evil courses

and to follow the latest racing tips in the evening papers, which after all, it should not fail to be observed, are at the bottom of half the mischievous signs of the times. The crusade against drink, which turned the soddened beast that was the working man of a generation ago into a more self-respecting citizen, needs to be succeeded by a campaign against gambling, which, as fostered by the halfpenny evening press of the Metropolis, is a more potent seducer from regular work than ever drink was.

C. G. H.

"A Question of Credit."

In the building trades controversy which has been raging in the daily Press, there is one point of view which is somewhat overlooked. The gist of the charges brought

this. Is it not really a manifestation, in this particular direction, of the new spirit which animates the workers all the world over—the settled determination to reap the fruits of their labour? We are told that whereas bricklayers would at one time lay from 800 to 1000 bricks per day, at the present day they will only lay from 300 to 400; but we are not told which is the fairest day's work. It seems to be taken for granted that 400 per day means laziness, without considering whether 1000 per day means high pressure and scamped work. It would be interesting to know the average number of years a man could work, putting in a thousand bricks per day, year in year out; whether he reached a hale old age, or whether he gave it up at forty—played out? and whether the work was done as well as it could be? Again, we are told that this action on the part of the workman raises the price of building, so

S. BERNARDINO, PERUGIA.

Vide ARTS AND CRAFTS AND THEIR RELATION TO ARCHITECTURE.

against the workman seems to be that he will do no more work than he pleases. His method of obtaining this end is described as organised idleness and systematic robbery. He is furthermore told that he drinks too much; which may be true, but beside the point. To this indictment Mr. H. R. Taylor, L.C.C., returns a trenchant *tu quoque*, containing remarks equally courteous, equally true, and equally beside the point. The matter is not simply one of the detailed management of building operations, it is a question of much wider significance, and will be settled by quite other methods than

that it costs the building owner 25 per cent. more than it did; but we are not told whether he still gets a fair value for his money. It is taken for granted that he is cheated out of this 25 per cent., without considering whether he used to get an unfair and usurious interest on his capital—at the expense of the lives of the workers—before the days of combination. Statistics on this point would also be interesting. "Surveyor" has a remark which seems to go more to the point, when he says that "where bricklayers will not lay more than 400 bricks per day on a thick straight wall, at so much per hour,

they will lay from 1000 to 1200 if paid by piecework." That is, they will work harder when they see that they, and not the contractor, are going to get the profit. If they will not put their hearts into their work, when another man takes both the profit and the credit, is it not natural? and who is in a position to cast the first stone at them. Is not this question of credit, of reputation, really at the root of the whole matter. Deep down in every man's nature, deeper than the love of money, is the love of applause. It is an elemental instinct of humanity. Men will do far more for fame, for love, for hatred, or for revenge, than they will for money; and even if we analyse the modern desire for money, we find it consists more of the craving for the power, influence, and consideration or credit which money now brings—the love of success for its own sake—than for the material comforts and luxuries. It may seem a little curious, rather "high falutin," to talk of fame—the goddess of emperors and kings, of heroes and poets—in connection with the British workman; but after all, he, with all his unlovely faults, is human; an emperor is no more. It is to be presumed that the elemental passions and instincts are common to both. We must also remember that, thanks to the recent spread of knowledge, the workman of to-day is not quite the same as he was twenty years ago. The board schools may not have taught him everything, but they have taught him discontent, and shown him that there are more things in heaven and earth—such things, for instance, as reputation—than were formerly dreamt of in his philosophy; and this is about as much as anyone ever learns. Although this question is not one which primarily concerns the architect, yet he, being anxious to obtain the best possible workmanship on the building, is interested in the methods of conducting the works in so far as they affect the results. Knowing also, from personal experience, how great is the incentive of reputation, he might be disposed to think that if some method could be arranged whereby the worker obtained the personal credit for his work, this work would be better performed. And in so far as the tactics complained of are directed against the contractor, and not against the building, it is the contractor's business to meet them. But if the architect does feel called upon, in the interests of the building, to interfere, he should recognise that every question has at least two sides—it is generally the other side which is the most illuminating—and so act more in the spirit of the conciliator than the violent partisan. We may bear in mind, also, that even though the present machinery of the trades unions were destroyed, there would still remain the spirit of discontent to be reckoned with, which would again find expression in possibly more serious form. If the object of this controversy is to expose the reasons which make building operations more expensive than they need be, this question of idle and negligent workmen is but one of them. There are others nearer home upon which any London architect could have discoursed with greater knowledge and authority. A. R. J.

THE Gresham Committee have received an offer of three further pictures for the decoration of the Royal Exchange. The offer is made conditionally, it is true, but the restriction imposed is so reasonable that the committee are not likely to experience the slightest difficulty in meeting the wishes of the intending donor.

A NEW school, erected by the School Board for London at St. George's Row, Ebury Road, Pimlico, was opened last week. The site was purchased at a cost of upwards of £9000, and the building cost £16,000. Accommodation was provided for upwards of 600 pupils—boys, girls, and infants—and it was proposed to add another room to the accommodation of the infant school.

TYPICAL NOTES.

Prof. Aitchison at the R.I.B.A.

PROF. AITCHISON'S inauguration address as President of the Royal Institute of British Architects, the concluding portion of which we publish in this issue, constitutes a thoughtful and useful contribution to his subject: "The Advancement of Architecture." It is unusual to find a man whose professional experience dates back so far as does that of the Professor, who yet retains an attitude of mind essentially literal, and in close sympathy with the architectural aims and impulses of the present day. Prof. Aitchison's criticism of certain erroneous modern tendencies was no cry of affronted conservatism, but a judicial discrimination of false from true, for which a long and varied professional career has given him remarkable qualifications. "I think the greatest obstacle to the advancement of Architecture," he says naively, "is the fact that the bulk of Englishmen do not care about it in the least," and in this, we think, he has just touched upon the heart of the matter. The architect is so bound and restricted by the needs and limitations of his Art that, unless his clients are in sympathy with his ideals, he can advise little. Prof. Aitchison's remarks upon planning, the choice of materials, and the use of wrought and cast iron in the fabric of buildings, are, we think, also worthy of particular attention.

An Underpaid Profession.

THE suggestive series of letters from our correspondents which we have published during the past few weeks upon the subject of the position of the architectural assistant have no doubt attracted a good deal of attention. The topic must be a sore one with many an unfortunate youth who has been led from the school bench and thrust into the river of architectural affairs without any real preferences or proclivities of his own towards the Profession, and who presently finds himself eddying round and round in a circumscribed orbit, with no apparent possibility of ever getting into the full flood of the stream. But these mistakes occur in other pursuits, and are due, not to the Profession, but to the shortsightedness of the subject of the calamity. An architectural practice relies quite as much on propitious circumstances as upon ability, and, unless a man is content to work for the sake of doing the work he likes, he is unjustified to enter the Profession without reasonable assurance of opportunities to open a practice. Most of our correspondents seem to forget that the order of "Architect" is of two degrees: Architect and Architect's Assistant. Registration, as suggested by one of our correspondents, would certainly improve the status of the architect, but it could not help the assistant; for registered or unregistered, if circumstances do not admit of his acquiring a practice of his own, he will have to take his place beside the architect's clerk, and do subordinate work for meagre pay as heretofore. The smallness of this pay for his work is occasioned by the number who are qualified to do the work. The difficulty or intrinsic value of the work done is of no concern. A glance at other Professions, however, will show us that the architect's assistant is not underpaid by comparison. A solicitor has to pay heavy fees for apprenticeship, and usually a heavy premium also. He has to qualify in general education, and has to pass two other stiff examinations, and pay further fees. He has to serve five years without receiving a salary, and after this what does he get? Nothing. Fifty pounds a year if he has distinguished himself and is fortunate, and the success of subsequent career relies as much upon circumstances as does that of the architect. A Doctor of Medicine has to be

a highly educated man, to complete a seven years' course of expensive education lasting six or eight years, and what awaits him at the end? If he is lucky £40 a year and board and lodging at a hospital. We must bear in mind, too, that architects cannot afford to pay high salaries. In the provinces circumstances vary a great deal, but we have been assured by two of the best known London architects that their office and incidental expenses come to *considerably more than half* the fees they earn.

Godalming Competition.

OUR special commissioner in his report on the designs submitted in competition for municipal buildings at Godalming, points out that the authors of the first award have failed to conform to the terms of the "conditions" in that they have placed the 10ft. approach to the fire-engine station in a different position to that precisely defined by the Council. This will naturally cause chagrin among those competitors who were possibly hampered in their designs by the restrictions as to the position of this passage way. At the same time we are always inclined in such a case to sympathise with the successful Architect rather than with his less fortunate rivals. It is impossible for any council—or, for the matter of that, any assessor—to grasp all the possible exigencies of a large plan, and when a competitor hits upon a brilliant solution of the essential requirements, it is certainly desirable that his prospective clients should benefit by his idea. It must be borne in mind, too, that the competitor who sets aside any of the specified requisitions of the conditions, does so, as he is well aware, greatly to the prejudice of his chances of success. If anything is to be regretted in such cases as these, it is that any precise restrictions as to plan should be imposed upon competitors.

Cathedral Restoration at Dublin.

MR. THOMAS DREW, F.R.I.B.A., in a letter addressed to the Irish Times, calls attention to the decayed condition of the eastern chapels of St. Patrick's Cathedral, Dublin. It is curious to learn that the Bath stone of the original building, which dates from 1255, is generally in good condition, while the Caen stone, which was used in restoring this part of the cathedral some fifty years back only, is rotting and crumbling away. Mr. Drew's letter calls to mind the lamentable story of the great restoration of this cathedral in 1864. It was the founder of Guinness's brewery who offered to meet the expense of the necessary repairs, and he seems to have been given a free hand, for he dispensed with the services of an architect, and himself appointed a builder to conduct the work. A huge sum of money was spent, a lath and plaster vault was put in to supplant the old wooden roof, and the whole building was covered inside with cement plastering upon which joint lines were scratched. In many places the carved ornament was knocked off to facilitate the plasterer's work. It is satisfactory to realise that such vandalism would be almost impossible now, although, it is true, the case of St. Alban's Cathedral is sufficiently deplorable. At any rate, Dublin benefited by the error, for when, some years later, her second Cathedral of Christ Church, which for years had stood propped up and in semi-ruin, was restored, it was George Edmund Street who was commissioned to supervise the work. Curiously enough, it was a distiller in this case who found the money. The restoration proved a grave undertaking. The work of the north aisle through its entire length was thrust back into the perpendicular inch by inch by a system of screw-jacks, and the transept arches were raised bodily several feet. The Cathedral was practically rebuilt to the architect's design, and cost some £200,000.

ARTS AND CRAFTS

And the'r Relation to Architecture.*

BY H. WILSON.

THERE are certain phrases containing more or less microscopical portions of truth which only pass muster in those expansive thumb-in-armhole after-dinner moments when buttered aphorisms, like conventional oysters, slip from cloudy heights down the epigastric slopes into the clear champaign.

Among these abraded epigrams is this—Architecture is the mother of the arts—a dictum doubtless begotten by some wit with

that the right conception has been overlain by misconception and suffocated.

But if we go back to the beginnings of things, penetrate as far as we can reach into prehistoric origins, we learn at once that the art of personal adornment and the craft of tool-making come first in the evidences of human activity. The art of using tools is acquired in the making of them—the stone-weighted stick becomes a hammer—the splintered hammer becomes the axe.

From splitting skulls to splitting wood the transition was easy and natural. Besides the more immediately insistent needs of protection, shelter, and the satisfying of hunger, there arose in the very earliest times that other need of self expression. Full of wonder at the mysteries with which they were surrounded on every side—the dawn and the

darkness, the gloom and hidden terrors of the forests, the strange creatures by whom the earth was inhabited, the dangers real and imaginary in field and flood—the minds of our half-dumb ancestors were crowded with conceptions seeking birth. This birth they found in what we call art. They eked out their stammering utterance, their gesture speech, with rude-cut symbols. They spoke to each other in their work, and one feels that art—rudimentary if you like, but still art—was the first real speech of mind to mind; and, whether that speech took the form of decoration of weapon or bowl or person, it supplied an outlet for nervous pressure, and the labour of making relieved their minds from the obsessions of crowds of new ideas, new impressions, engendered by the beauties of the outside world. Not only did the making of things for use or

THE LITTLE CLOISTER,

CERTOSA DI PAVIA.

a bowing acquaintance with Architecture and a refreshing innocence of Art. It is one of those worn counters from an obsolete mint which keep real currency out of circulation, or, to change the image, it is a mental *cul-de-sac*, the result of what psychologists call "mental arrest." The aphorism renders real investigation difficult by acting as a stumbling-block. That said, we are tempted to think that there is nothing more to say. But immediately the stumbling-block is turned over we find that it hides the entrance to a new world of inquiry, and opens out new views of art and craft and Architecture. We begin to see that Architecture is not the mother of the arts, for they existed thousands of years before she was born—we find that the arts and crafts are the ancestors of Architecture, and that even now Architecture is born from their conjunction, and does not give birth to them. The question has been obscured by much discussion, and so many false ideas have been imported into it,

ornament give an outlet for new ideas in the making of the humblest article of use, the savage by unconscious symbolism built up for himself a kind of religion. We find the Pueblo Indians, who worship water as the principle of life—to whom a vessel, because it holds water, is sacred—express their belief on their pottery in a very remarkable way. The inclosing lines, the circling bands of ornament, on their bowls and vessels are never joined, but a space is carefully left open in such band. The women, who are the potters, say this is to leave a door for the life spirit. In their words, it is a departure trail for life or being.

When a woman has made and painted a vessel, she will tell you with an air of relief that it is a "made being," and, as she places it in the kiln, places food in the vessel and beside it. The noise made by the pot when struck or when simmering is the voice of the included being; the clang of it when the vessel breaks or cracks is the cry of the spirit escaping.

This being never cries out unprovoked, but is supposed to acquire the power of doing so

* A paper read before the Architectural Association on Friday, November 11th, 1898.

CENTRAL DOORWAY, ORVIETO CATHEDRAL.

by imitation, and no one whistles, sings, or makes any noise during the process of manufacture lest the being should imitate the noise, and by doing so crack the vessel and come out. Here we have art and craft as the early exponent and material source of early religions. In the South Seas we find that even the stone axe, from its associations with its maker, becomes first the symbol of the ancestor and later the object of worship. The handles of these sacred axes are carved by the "sacred men," who, during the whole process, chant songs and prayers to the gods that they may further the work and inspire the craftsman. Thus, as all the world over, the arts and crafts beget the first beginnings of expressed religion, and lay the humble foundation of the faith which made man "raise the soaring spires and sing his soul in stone." Out of arts and crafts all human achievement has sprung.

For we must remember that at this early period each man was an artist because he did not concern himself with art just as children do, and say and think beautiful things naturally; only when we teach them do they become affected and artificial. And all that our ancestors thought of was the suitability of the thing he was making to the use for which it was designed. The decoration of it was a natural instinct as those of sleeping or eating. Impelled by that unconscious passion for creation, as by a spiritual procreancy, the dimly comprehended beauties of the scene around him impinging on his perceptions stimulated his conception—pushed him out of himself into his work. His hut with its contents, was a little exhibition of the arts and crafts in embryo. We are looking at the remains of the first beginnings of Architect-

ture in the lap of time. Our ancestors were the primary craftsmen, and this art expressed his nature, gave form to his spirit, as the plant expresses the principle of growth—the life within the seed.

Nor was this all. The offspring of this primitive artist would naturally imitate their parent. Besides the inherited aptitude, besides his precept they would have the continual stimulus of his example to urge them on to other efforts on similar lines, and thus early arose families of craftsmen—with nascent traditions and methods of work. When the scattered families gathered into tribes and built their palisades, they joined themselves into families of craftsmen and formed the rudiments of a guild, a society within a society, a centre of social activity inside the new society!

Each member of the family worked out in his own craft the budding ideas of early symbolism, doing nothing without a definite object, more influenced by the wonder of the world around him than impelled by a conscious ideal of beauty, the character of his work was at first governed absolutely by the nature of the materials at hand, so that he found lines of beauty in the fracture planes of flint. Then by elaborating the rude notchings in the weapon haft he produced the intricate patterns on his paddle, or he evolved bands of ornament from the marks made by the cords, or the wicker-work moulds which bound together his first rude efforts at pottery. He was taught by difficulty and inspired by Nature. His mind grew as the plant grows, and his art was the fruit—the spore from which, under other conditions, a higher growth was to spring. When in the course of centuries the congress

of the families of craftsmen gave birth to the guilds, their power came not merely from the infinite slowness of their growth, but also from the infinite ramifications of the roots which each individual fibre of that organism sent back through each item of its ancestry into the remote past.

The guild became the wide-spreading tree rooted in society, under whose branches every human being sheltered. It was as much the natural product of evolution as the family or the human being—like the human being also it found its completest development late in history. The hereditary craftsman existed, worked, and trained his offspring long before city life attained any high development, but when that development took place, and corporate life sprang from the associated lives, then the formative idea the soul of the society and its governing power centred itself in the guild.

And when I say that the guild only came into corporate organised existence late in history, it is only late in relation to the time taken in the evolution of society, for in Egypt in some of the earliest monuments we find that the brotherhood of masons had existed long enough even then to become mythical; we find mention of the heavenly architect Ptah, who in conjunction with the chief of the brotherhood of masons, founded the temple of the heavens on the abyss of the waters. The master builder as prince priest and creator is thus bound up with the origins of the religion, the shrines of which in later times his descendants were to build.

Coming down to more historic times, we find that in the development of crafts from family industries to trade guilds, it early became a law that each man shall train his family in his own trade. In far-off Peru, in earliest Egypt and in India, this custom prevailed. It was the same all through Europe. In the Institutes of Theodosius, a Roman youth was compelled to follow the employment of his father, and the suitor who sought the hand of the daughter could only obtain the bride by becoming wedded to the calling of her family. So in mediæval France crafts were inherited, and also in England. Thus the branching of the family through generations into a number of kindred families, carrying on the same occupation, produced the germ of the guild and formed a distinct cluster in towns. In process of time came apprenticeship into the family circle to learn the trade. By-and-bye, with increase of trade, the master develops into the trader, and the workman into the citizen. Thus the craft guild is the typical form of the institution. As Lambert says when the townsmen of Stratford-on-Avon were required in the year 1381 to make a return to the King's Government as to the ordinances of their guild and the date of foundation, they made reply that as to its origin it was "Whereunto the memory of man reacheth not." The saying was a wise one. There is no institution which has had a wider distribution, or which reaches further back into the mists of ancient history, and there is, perhaps, no institution which has had a more important influence on human development.

Not only did the guilds mould and govern social life, they influenced religious life also, for there was then no distinction between the two. From almost the earliest times each guild was dedicated to some presiding genius, some to the Muses, some genius, or in Christian times to a special saint. In the Western world we have St. John, St. Michael, St. George, St. Crispin (cobblers), St. Peter (weavers), Our Lady of Pity, St. John the Baptist (tailors), St. Luke, St. Margaret, St. Barbara, St. Clare.

In the Eastern world we have Adam as the patron of the bricklayers, builders, and sawyers, Nimrod of the smiths, Noah of the carpenters, and Enoch watches over the workers of metal and the makers of copper caskets.

The important meetings and feasts were held on the festivals of the patron saint; the needs of the church were largely met by their funds—they gave windows, altars, reredoses, built chapels, chantries, whole churches even; and when we remember that the first meetings of the Christian Church in the first centuries were held as often in the guild halls, schools, or the

collegia, as in basilicas, and that in these guild halls with their apsidal ends, features absent from the pure basilica, we have the germ of the plan of the mediæval cathedral, we see how the guild has shaped the house of religion. Even in Phœnician days we find that the factories set up in the ports scattered over the Eastern and Western world were used not merely as places of business and halls for the guilds; they were established in the first instance and were continually used as places of worship sacred to the cult of various deities, and a contribution was raised on all the mariners visiting the port for the sustentation of those places of worship; and in the later period of the Empire, Syrian merchants, chiefly Apamean, are found settled not merely in all Italy, but in all the larger emporia of the West—at Malaga in Spain, in Gaul and Germany, at Bordeaux, Lyons, and Paris, at Orleans and Treves. They are found in these Gallic towns after the Frankish conquest, and Salvianus and Gregory of Tours both speak of them, and show that they retained their national customs and organisations. Here, then, at length, we find the Roman cities of Gaul, and probably also of Britain, with their Collegia and Sodalicæ, brought into close contact with the trade associations of the Syrians, representing the Greek and Phœnician tendencies of the commercial East. We must remember that the commerce in those days compares very favourably with the present day. In Central Asia, in Tibet, and Mongolia the plains now known only to scattered colonies of shepherds, or the ignorant inhabitants of isolated villages, were once dotted with flourishing cities, the capitals of powerful kingdoms, bound together as by bands by great trade routes traversed continually by crowded caravans. Merchants from Macedonia found their way to farther China, and threaded the passes of Afghanistan and Cashmere on their way to the Hindoo peninsula. Then from all these countries came traders, themselves masters of some craft, travelling with their wares over the Indus, over the Euphrates to Syria, up the Oxus to the Caspian, thence to the Black Sea and Europe. Now Central Asia is waste, the Oxus no longer flows into the Caspian. The streams of caravans have ceased, and life flows in other channels.

The Phœnicians, with their fellow-civilisations, have faded utterly away. Through their descendants the Greek-speaking Syrians continued their work. But imagine the influence of these wandering guildsmen and their descendants exerted while they lived. Can we wonder that Architecture is a romance book when it was written by men who came daily into contact with these living records of adventure—men with minds stored with strange legend, full of fascinating tales, who threaded the ways of Western Europe, resting awhile at each notable town, the guest of their own or the local guild, where we picture them seated with the master and the wardens at the high table, the swarthy, prick-bearded, keen-eyed Syrians, recounting adventures, pouring out traveller's tales to the open-mouthed craftsman, who from this living book got an inkling of Oriental learning, heard the latest legend, heard of the last new statue, carving, or masterwork in metal, made by members of the Eastern guilds. He would see open before him bales of strange stuffs; the guildsman would display his bronze and silver ware, his belts and brooches, his earrings and bands of gold, and all, from the master to the apprentice, would drink in the influence of the East, as mystical as wonderful to the Western then as now. Thus we get the guilds as the disseminators of culture, distributing centres of intellectual force as well as shapers of society. They were publishers of living, useful knowledge, loops in the network of organisation which art and trade, even in those early times, had thrown over the civilised world.

The influence thus gained by these organisations naturally fluctuated—wars, tumults, invasions, each brought disturbance and destruction with them. But guilds founded on an unchanging human principle grew steadily in power until, in the Middle Ages, in England and the Continent, as Dr. Lambert says, the whole municipal, industrial, and social life moved in the circle of the guild. The guilds

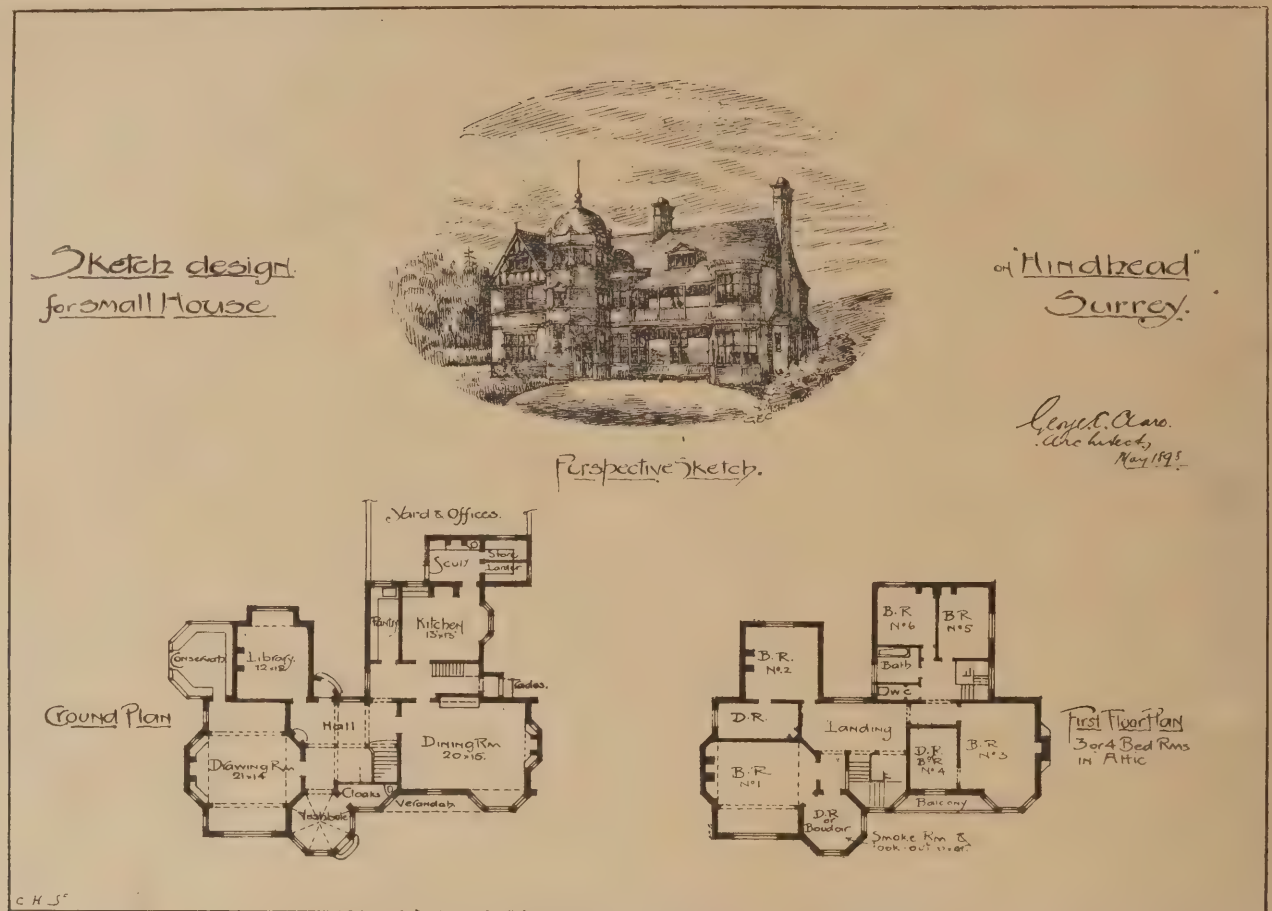

were the chambers of commerce, the friendly societies, the trades unions, the freemasonry, joint-stock companies, the militia, and the police, and in a way were local Parliaments. As early as the end of the twelfth century the Rectors of the Art Guilds in Italy assisted the Podesta, or supreme magistrate, in governing and ordering the cities in which they lived. More than this, the guildsmen, by their shows, pageants, and miracle plays, provided largely for the amusements of their times, and laid the foundation of dramatic art, which later was to give us Shakespeare, Molière, Goethe. They were at once the heart and brain of their people, and in studying their history we are carried back and plunged into that throbbing life which though it produced them they directed, and we see in what an extraordinarily simple way the whole thing was managed. Members of one great family, they sat beside each other in the feasts, played in the miracle play, rode in the pageant, fought side by side with the others, and in siege time together paced the ramparts; they helped each other in distress, saw that likely youths were made apprentices, and sang masses and burned candles before Our Lady for the peace of the souls departed. In studying their records and their works we are touching the living body of a living society; we walk with the young apprentice through the narrow streets to his master's shop; we learn the secrets of the counting house, the mysteries of the crafts, and we understand how it is that our fathers did these wonderful works which we emulate in vain, and how futile it is that isolated individuals should try to imitate or repeat what were the products of wide-based, close-linked society, instead of seeking the same harmonious and intimate relations with their surroundings which our fathers established,

and working out ourselves naturally on the firm basis of individual craftsmanship. But the origins of this want of harmony with our surroundings are to be seen even in the works of the best period of the Renaissance, for after the ebb of that tide of effort which gave us the fine early work at Verona, Venice, and elsewhere, we see traces of the intrusion of the designer into other spheres. We have the painter and the sculptor designing for the metal worker, not executing the work for himself, but getting others to do it, and this invasion of the designer soon developed into the establishment of design as a separate faculty as we know it now.

To return for a moment to the consideration of the prehistoric crafts from another standpoint. These integers of design, detached, disunited, the scattered seeds of Architecture, yet contain in themselves the essence and the promise of the highest art. The natural craft, the uncultured artsmanship, was limited in range and achievement, because it was the product of isolated minds, but when men banded together the gestation of Architecture advanced another stage. The work of each man was modified in aim and character by that of his fellow, just as the single circular cell of the primitive bee became hexagonal when clustered with other cells of other bees. The comb is the logical outcome of bee-society. In like manner each of us is modified by contact with other natures, in the close-packed human crowd. As the body is built up of cells, each modified by the position and functions assigned to it, but each aiding by adding its individuality to the general system—in the production of the complex organism man—so man as an infinitesimal item comes with his instincts and faculties into the social system is modified and developed by new conditions into a newer and higher being. His art has

SHRINE OF S. SEBALDUS, NUREMBERG. BY PETER VISCHER.

DESIGN FOR A HOUSE IN SURREY. GEORGE E. CLARE, ARCHITECT.

undergone precisely similar changes. The rudimentary arts of our ancestors, when brought into mutual contact, were changed in character and raised in aim though their fundamental nature is the same. The personal arts were the individual components out of which the body of Architecture was ultimately to be shaped. The self-centred, single-expression art has become a social expression. The man, no longer concerned solely with himself, is informed by a new spirit. The scattered items are united by the social idea—the work of those items in every department of life is shaped and guided by the spirit of the race, and is the material expression of that hidden life, guiding soul, which everywhere animates society.

Architecture is thus a complex art, a social art; it has never been and never can be a one man art, as painting and the crafts, any more than a body can be composed of only one cell. And as that material envelope of the human spirit we call the body is the absolute expression of the human soul, so that material envelope we call Architecture is the absolute expression of past states of the racial soul. This it is which gave the artists such strength in the past. His was not a detached existence, a separated, solitary-studio life; he had the whole body of the people behind him. He was the point with which the nation wrote its history. He was the tool of the race. And were we psychologists enough, were our powers of divination great enough, we might read in the open scroll of building not only the history of the actual craftsman, but the history of his time and people, and gain a graphic idea of the growth of mind. This because the craftsmen were the means of Architecture—and the buildings were the opportunities of craftsmen.

The key to human development is found in evolution, and the key to Architecture also is found in the gradual evolution from arts and crafts unconsciously. It is the unconsciously produced record of mental development. It is a kind of spiritual skeleton. A cathedral with its innumerable cells and vaults, its pillars, spires, and pinnacles, bears the same relation to the complex organism which produced it that a sponge bears to its secreting cause. It, like

the sponge, is the symbol, the formula, the evidence, of vanished life. Our judgment, therefore, of the cathedral as a thing in itself, merely as the production of the conscious art of one man, is as valueless as a criticism of a sponge would be made by a man who had never seen the living animal.

Just as the sponge is built up under the stimulus of the life of it by the labours of countless silica secreting cells—each cell the descendant of a long line—so the cathedral is made by a number of stone-laying organisms under the stimulus of the collective life, religion, enthusiasm, ordered by the directing mind of the master, who is himself but the servant of a greater power. All the separately acquired skill, all the individual art and craft, all the personal life of each individual is fused into the general mass, and is there given new importance by sharing in that mass. The building is enriched by the work of the individual item, and that work is in turn ennobled by being part of the building. The harmonious aggregate of the personal arts becomes the impersonal, the human—the racial art of Architecture. What is true of the great things is true also of the lesser. The lower order of buildings, to use the common distinction, were produced by humbler organisations, and, because they were the simple direct and logical outcome of special social needs, were beautiful in structure with the beauty that one feels in a leaf, a plant, a shell. The work was beautiful not so much because beauty was sought, but because the work was the natural expression of the lives of men in harmony with their surroundings. Its value to us is in the unconscious evidence it gives of the minds of those who produced it. For what is most precious in our own work is not what we consciously seek for, nor what it is our will to express, but what we unconsciously reveal of ourselves, our race, our society, our condition.

(To be continued.)

A new aisle has just been added to St. John's Episcopal Church, Aberdeen. The architect was Mr. Arthur Clyne, Union Street.

Godalming Municipal Buildings Competition.

BY OUR SPECIAL COMMISSIONER.

THIS competition was advertised early in March, and architects willing to compete were required to send in their names by a certain date. Forty-five applied, and from these the Council selected eleven to compete, the original limit as to cost being extended from the £5000, as at first advertised, to £7000, and Mr. Mountford was appointed assessor. The site struck us on our first visit as somewhat unworthy of a public building of this character, as it is not in the main street, and lies very low, and moreover has a very high ground-water level. An existing concert and drill hall occupies about half this site and frontage, leaving a long and narrow piece for the new municipal offices and fire station. There is also a second but inconvenient entrance to a side road from the back of the site.

The schedule of accommodation was as follows: Ground floor—Court room, magistrates' and witnesses' rooms, surveyor's and sanitary inspector's offices, strong room, rate and water offices, an armoury, and the usual conveniences; fire engine house and men's room and hose-hoist tower, and a number of stables and sheds at the back. First floor—Council chamber, committee room, town clerk's offices, and conveniences. Caretaker's rooms had also to be provided, and the front of the existing hall re-erected in harmony with the new work, the exits re-arranged and a gallery provided, and a space of 20ft. reserved at the back of the hall for future extension. Minimum sizes were given for all the more important rooms, and the conditions required that the resulting areas should be equivalent if the dimensions were varied. The most important of the conditions related to the fire engine house. If this were placed in the rear of the old hall, a

PAIR OF VILLAS AT CHELMSFORD. GEORGE E. CLARE, ARCHITECT.

10ft. way was to be made a *sine qua non* next this hall, but if placed at the front a 6ft. way was admissible.

Of the eleven selected architects eight only sent in plans which we propose to criticise in the assessor's order and the remaining five in rotation as numbered.

The first place is allotted to Messrs. Lanchester, Stewart, and Rickards (No. 1), and their design is very pleasing, notwithstanding its attenuated appearance. The plan is good, bar the very ill-lit corridors, but it emphatically contravenes the conditions, as they have put the fire engine house at the back of the site and only put an 8ft. way next the Hall. They have put a way next Mr. Bradley's property 9ft. 6in. at its narrowest point. It seems, therefore, very unfair on the other and more conscientious competitors, that this design should have been placed first, more especially as the site plan supplied was coloured to show this particular 10ft. way next the Hall. No. 1 also places the magistrate's room at the end of their 8ft. passage, so that when the stipulated 20ft. is used for future extensions at the back of the Hall this room will be much in the way. The entrance hall, corridors, and main staircase are all badly lit, as also are the sanitary inspector's room, the armoury and surveyor's office.

The armoury is smaller than the minimum size given, and the Town Clerks' accommodation is less than stipulated for. The court room is placed at the back and is very well arranged, and in lieu of cells, a couple of prisoners' rooms are provided. The municipal offices and council chamber are placed towards the front, the latter being parallel with the length of the old hall and against it. The council chamber is not well arranged as the doors open at the backs of the councillors, but the electioneering gallery is a popular and effective idea.

The staircase to the gallery of the hall is also utilised for the caretaker (who is well packed away in the roof), but he would fare badly in case of fire. The loggia at the main entrance would be vastly appreciated by tramps and boys as it is quite open.

Architecturally the design is rather like a large hostelry, but then none of the designs convey the Town Hall idea.

The drawings are rather rough, except the

washed perspective, which is neat and forcible. The estimated cost is £7097.

Mr. E. R. Robson (No. 6) is placed second with a compact plan, the only defect of which is a somewhat unimposing staircase. The corridors, etc., are well lit, but the surveyor's clerks' room might be improved in this respect. The engine-house is the best arranged of all the plans; it is near the main street and having doors at the back, the engine can also be got out by the back roadway. A corn and hay-loft is also provided which, if not essential, seems desirable. The court room is well-arranged at the back and three cells are provided. The council chamber is on the first floor next Mr. Bradley's property, and is convenient except that the fireplaces are rather close to some councillors' backs. The design is rather severely harmonious, but is more like a Technical Institute than a Town Hall.

Messrs. Ardron and Dawson (No. 2) are placed third, and show a very pretty specky pencil perspective, which, however, could not be built for the money. The engine-house is inconvenient, as the engines have to turn a corner to get out either way. The police-court is well-arranged, but a very narrow public way next Mr. Bradley's is shown—at one point less than 3ft. 6in. There is a top-lit staircase and a rather wasteful imposing hall.

No. 3 covers nearly the whole site, and could not be possibly be done for £7000. A good deal of space is wasted in the entrance hall and the lighting of the corridors, and some of the rooms are bad. No fixtures are shown in either the court room or council chamber, contrary to the conditions. A 3ft. way and a 10ft. way are provided. The design is heavy Queen Anne.

No. 4. This is a compact plan, and the best drawn set, in a severe Georgian style, the best part of the design being the stables. The corridor of the first floor connecting the hall gallery with town clerk's floor is not happy in design. Here again the engines have to turn their corner. There are no sectional lines on the plans. This plan places the council chamber at the back, and in connection with it is a robing room. The surveyor's office is dark, and the sanitary inspector is put on the first floor. All the caretaker's belongings have to come up the principal staircase.

No. 5 shows a design by a good washed drawing, and is compactly planned. This is the one design to show the hose-tower towards the road, taking up part of the space in front of the old hall. The work room to the engine-house, rates and water offices, and Surveyor's department are not very well lit. The Council chamber is placed like No. 1 next the hall. The design is rather picturesque, and shows a knowing *fêche* with an Antwerp bulge in it.

No. 7. This is decidedly a good plan, but could not be done for less than about £9000, if that. There is a rather wasteful central corridor in addition to the stipulated 10ft. way. The furnace room is on the ground floor owing to water difficulties, which only a local man would know. The stairs are well lit, and a porter's room is provided. This is the one design to show a wooden hoist tower and a watch-room. The design is wasteful with its high tower (bell and clock) and *fêche*, and the roof seems ridiculously steep considering that it is not utilised. The first floor windows in the design seem to weight the front too much, and suggest that they might sink down, as the first floor is recessed somewhat.

No. 8. This is the only plan to give the Surveyor's offices proper light, and to put the council chamber at the back over the police court at a higher level than the rest of the first floor. As in No. 6 the caretaker is well isolated. This plan, like No. 1, contravenes the condition, in giving a 6ft. way next the hall, and placing his fire-engines at the back. The Assessor in his report recommends that a little more money be allowed for these buildings, that they may be worthy of the town.

THE opening ceremony of the new Cottage Hospital took place at Thetford on Saturday week. Mr. J. H. Green, of Norwich, was the architect; and the builders Messrs. Boughton and Son, of Thetford.

THE Archbishop of Dublin has dedicated a new Communion table that has been erected by the Chapter in the Lady Chapel of Christ Church Cathedral, Dublin. The table is made of carved oak, and has a handsome frontal of green on red brocade, with ospreys on a green cloth of gold. The centre-piece is composed of *fleurs de lis* and crowns emblematic of the Holy Trinity.

REIGATE COMPETITION.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—We have carefully read your Special Correspondent's report upon the above competition and your remarks based upon that report.

Whilst agreeing with much that you say, may we, as authors of the first premiated design, be allowed to indignantly protest against a sentence in your remarks. The words referred to are as follows:

"It was only to be expected that the award of the 'assessors' would indicate the bias of a local and personal preference, and this seems to have duly occurred."

We entered this competition absolutely unacquainted and, as far as we know, entirely unknown either personally or by name to any member of the Town Council or the selection committee, and not until after we were selected did we even know the name of anybody on the Council or any person of influence in either Redhill or Reigate.

We hope, in fairness to ourselves, you will make this known, as we feel sure you would not willingly impute or imply the existence of dishonourable conduct to anyone except upon the strongest evidence, and in this case there is absolutely not the slightest foundation for even a suggestion of such a nature.

May we say a word more as to your special correspondent's report.

We agree with him in some of his remarks, but we cannot think, looking at the glaring inaccuracies he has fallen into, that your correspondent gave more than a very cursory glance at the drawings.

He makes a statement, for instance, when speaking of our design which, if it were founded on fact, would certainly place Mr. Arnold Mitchell's admirable design easily first. We refer to the remark that to the whole block of the main buildings there is only one principal entrance. If your special correspondent had glanced for one moment at either the plans, elevation or sections, he could not have failed to observe two prominent main entrances, and two subsidiary entrances also, in most conspicuous and unmistakable positions.

This fact entirely nullifies the correctness of his remarks as to long corridors.—Yours faithfully.

MACINTOSH AND NEWMAN.

"Beechwood," Balham, S.W.,
Nov. 10th, 1898.

Messrs. Macintosh and Newman have evidently misjudged the true significance of the sentence to which they take exception. If they will carefully read it through a second time they will see that nothing whatever is said, implying or inferring that they were placed first as the result of anything but real merit. We certainly did suggest the presence of a personal or local bias, but not a single word is to be found in either our special correspondent's article or in our editorial note imputing a dishonest award in the case of Messrs. Macintosh and Newman. If Messrs. Macintosh and Newman will read our special correspondent's remarks before looking at our own comments, they will see that the ground for complaint is in the awarding of the third premium to an assistant in the Borough Surveyor's office, whose design has very generally been considered unworthy of third position; that the first and second premiums were at least honestly awarded we have never called into question; and we accept Messrs. Macintosh and Newman's statement that they were strangers in the land, so far as the "assessors" were concerned, absolutely and without reserve.—ED. B. J.

"THE SHIP," a famous Dublin inn, associated for upwards of a century with celebrities in art, literature, and journalism, and in the present generation a well-known resort of Edmund O'Donovan of Merv, "Ghazi" Power of Khartoum, John Augustus O'Shea, and a host of other Irish literary men, is to be sold by auction.

MODERN ARCHITECTURAL TENDENCIES.*

By H. V. LANCHESTER.

WE can hardly look forward with any prospect of forming accurate views as to the future without taking some retrospective glances to obtain our bearings. Up to about sixty years ago our Architecture was running in more or less parallel lines with Continental, then we broke away, leaving a few to carry on the previous traditions, such as the Cockerells, Pennethorne, and some of the best provincial men, while others, such as Burges, Street, Devez, and N. Shaw, struck off with the object of securing a more distinct personal touch. Many have been their followers, but the course they steered was beyond the capacity of most, and while the three first were fortunate in leaving us before the great downfall, the last-named is now expiating his sins by the adoption of a severe classicism. While one would feel it hard to lose the work of four such striking men, one could well wish that their influence over their weaker brethren might have been abated. No architect would have dared, prior to their heroic individualism, to have inflicted on his conferees and the public such blatant puerilities as compose the bulk of modern architectural work. Then the lesser mind took refuge in the conventional, unexciting but inoffensive. Now, it unhesitatingly puts forth whatever form of foolishness happens to come up first. Compare foreign schools—with the exception of a few vain and ineffectual excursions into Romanesque, Gothic, and Oriental—they have stuck firmly to the Classic tradition, which, while it perhaps suffers from a slight tendency to sink the individual, more than compensates for this by the way its insistent demands on a thorough training in proportion, welds the whole body of its votaries together and makes possible a definite and deliberate progression which can only be compared to the gradual evolution of mediæval Architecture. Our irregular course has precluded us from taking this position, neither is it practicable for us to take up a foreign style and base our work on that, our national sympathies prevent such a course being satisfactory. Besides, all foreign schools (practically French) seem to most of us to lack what we consider essential to a happy result, in that their designs are too self-contained. They do not allow them to take any colouring from the natural surroundings in which the building is to be placed, everything must be handled and modelled to weld it in with the somewhat sophisticated architectural treatment, consequently their work, while unquestionably supreme in urban buildings, is not infrequently less satisfying amid the rural surroundings of the orchard hedgerow and meadow, than our perhaps cruder efforts. Our strong points may be a preference towards

SIMPLICITY AND SEVERITY

—if we knew how to secure it. An absence of architectural vanity in our contentment to subordinate our designs to natural surroundings if desirable; and the useful check put on superfluous exuberance by our utilitarian spirit. Our weaknesses are due to our almost entire lack of technical skill in handling of mass, proportion, and detail, and our loss of the restraining influence of tradition, the less to be spared on account of our feebleness of technique. As a result we tolerate architectural trash that would be tolerated nowhere else, and even really inspired architects fail to succeed in expressing the ideals that may perhaps be seen lurking dimly behind their work. I am inclined to think, however, or at least to hope, that there are signs that we are awaking to a perception of our present disorganised state, and that we are beginning to see that a severer mental training in the matters that constitute true Architecture is necessary before we can produce work that will be any account in the history of our art. Not

* A paper read before the Discussion Section of the Architectural Association, on Nov. 4th, 1898.

that training will supply the place of the imaginative faculty, but only the power of handling our materials so as to produce a logical and harmonious result. Instead of a heaping together of incongruous and inconsequent fragments, our designs will then appear coherent and inevitable. With regard to the line of training which is being adopted to attain this end, there seems no question that at the present it is based on the Classic tradition. The fallacy of the possibility of evolving at a bound a living architectural style simply from the utilitarian treatment of material, though it boasted an exponent as learned as Viollet le Duc and is undoubtedly fascinating, has long ago been exploded. History shows that no previous development, however great, has arisen except by

THE GRADUAL PATH OF PRECEDENT,

and as we most decidedly feel that the spirit of mediæval times is quite out of sympathy with our own, it need not take much to convince us that but for the irruption of the few individualists that have really distracted us from our natural course, we should have continued the traditional manner in which all were working at the beginning of the century, and which is really a tradition that, with very slight break, can be traced back in various phases and in one clime or another, almost to the earliest periods. Taking this tradition we perforce adapt it somewhat to our own necessities and new views, while our feeling for composition and proportion is cultivated by the study of work that embodies the ideals of what are probably the highest civilisations of the past 2500 years. With this wholesome check on any exuberance that might outrun the bounds of rational and refined work, all our energies can be put into a logical levelling up of our design. Originality may come, perhaps to some of the more gifted, but sound and harmonious design is possible to all.

OUR ILLUSTRATIONS.

"HINDHEAD."

THIS house was designed for a site on the famous hill near Haslemere, Surrey, but was not carried out. The Hindhead commands magnificent views of the lovely undulating scenery of Surrey, extending to a radius of nearly twenty miles. The architect was Mr. George E. Clare, Chelmsford.

SOME SEMI-DETACHED VILLAS.

THESE villas for Dr. Thresh are now in course of erection on a piece of orchard ground in the suburbs of the county town of Essex, pleasantly situated at the junction of the New London Road, with the old Roman Road. Besides the accommodation shown on the plans, two good bedrooms are provided in attics; and coal cellar, larder, and store in basement. The materials used are local red bricks, with Ancaster freestone dressings and Broseley tile roofs. Porches and vestibules are paved with mosaic paving, and halls with ornamental pitch pine block flooring. The woodwork to halls and staircases will be treated with green oil stains in two tints and wax polished. The dining-room grates are fitted with Shorland Bros. "Calorigens," which utilize the back heat of the grates for warming the bedrooms over. A gardener's cottage is also being erected in the rear for Dr. Thresh. The contractor is Mr. C. West, Chelmsford; and architect Mr. George E. Clare, Chelmsford.

THE "Red Church," Bethnal Green Road, has been restored at a cost of £2000.

At a cost of between £30,000 and £40,000, a nurses' home is about to be erected at the Royal Hospital for Consumption, Brompton.

THE Bishop of London has fixed the 17th inst. for the opening of the completed Schools of St. Stephen's, Westbourne Park, W. The total cost has been £10,000.

The Advancement of Architecture.*

BY PROF. AITCHISON, R.A.

(Continued from page 217.)

THE painters and sculptors laugh at us when we say we want the public to show us what they like and what they want, and say, "We struck out a new type of woman never before painted, and new methods of treatment, and the public appreciated it and asked for more;" but their case is quite different from ours. It is not pleasant, I confess, for a painter to paint a picture or a sculptor to model a statue that does not sell, but an architect cannot put up a monumental building in the hopes that the public will approve of it and pay the expense. The most he can do is to show a drawing or a model in public, and persuade men in power or of immense wealth that he is both capable and original, and will be able

TO CHARM THE PUBLIC

by his work. How did the architect of the Erechtheum persuade the State to employ him? So small a monument as that of Lysikrates could well have been shown by a model. To get the proper teaching is not so easy as to say we want it, but I think in architectural education, as in general education, we must endeavour not to teach that which is dead nor that which is useless, but confine ourselves to the necessary and the useful. I think it is obvious that Architecture is the poetry of construction, and consequently the first thing to be taught is construction, and it is not the mere rough knowledge of the main principles, but that exact and accurate knowledge which was possessed by the late Romanesque architects of the properties of stone. They got this knowledge mostly by the failure of their buildings, but they reasoned on the causes of the failure they observed; they thought, and they dared; while we have most accurate means of testing the strength of every material that falls to our hand, and if we be mathematicians we can solve every stress and strain, as the engineers have done. We have

MANY NEW MATERIALS

that our predecessors had not, and some of extraordinary strength and of a capacity for taking nearly every form with ease; I speak here particularly of cast iron. This is not without dangerous qualities when exposed to fire, but we ought not on that account to neglect it. With wrought iron we have other difficulties to contend with besides the danger of fire, for it is very difficult, and still more expensive, to make this in any agreeable or beautiful shape, and to ornament it; but we cannot believe that the mediæval architects would not have largely used both materials if they had possessed them. We have, too, practically a new material in concrete, but this material also is not without its difficulties and its drawbacks, and we have besides the whole of what I may call old-world materials to our hand to deal with structurally in a more perfect way than they ever could have been dealt with before, and the whole category of old shapes to use and new forms to adopt that have never been used before. If the dictum of Sir Joshua Reynolds be true, that by becoming familiar with the invention of others we learn to invent, the great knowledge that we possess of past Architecture should make us

MORE READY TO INVENT;

but in fact, the gift of invention, as far as architectural forms are concerned, seems almost extinct. We have only this to say in excuse, that from the fifteenth century to the middle of the last century, European architects had nothing but Roman Architecture, or its Renaissance imitation, to study and to use; since then we have had Greek and Gothic. Neither of these styles, however, was used to stimulate invention, but merely to copy, and even in the present day it is doubtful whether

the invention of a new form, unless it were surpassingly beautiful, would be tolerated, for antiquarianism has usurped the place of Architecture. We must, of course, study the expressive and beautiful buildings of the past to learn how their effects were produced; but, having learnt that, our object should be to invent other proportions and other shapes, whose effects shall be equal or superior to those of the past; and when I speak of invention it is merely the adaptation of some of the innumerable forms of Nature. In the present day we should say that there was even less invention amongst architects than there was amongst the Romans, for the Romans at least started a new method of adornment when they carved the shafts of their columns or covered their pilasters with running foliage; but, of course, it is to the Gothic architects that we must look for those rapid adaptations that we now call inventions. Gothic Architecture from the time that it emerged from Romanesque passed rapidly through what we call Geometrical and Decorated, till it fell into the mechanical stiffness of Perpendicular. Were these men blessed with greater powers of invention or adaptation than we are? or is it that the gift has become atrophied for want of use? At any rate,

THE SUBSTITUTION OF ARCHEOLOGY FOR ARCHITECTURE

must tend to this result, for if the wing of the apteryx dwindled to the size of your thumbnail for want of use, it is probable that our powers of invention will do the same. I think that we are not so destitute of invention as we appear to be, for in out-of-the-way places in the country you see the elements of new Gothic and new Classic, where the architects have not been very learned, and have not had the fear of the archæologist before their eyes. When one speaks of invention, good invention is meant, and if we have the gift of invention it is only by the constant exercise of it, and by comparing our inventions with the excellence of the past, that we are likely to progress. I feel sure that the Architecture of one century, or perhaps even of one quarter of a century, should not exactly resemble that which went before it, for besides our proclivities and aspirations not being exactly those of our fathers' time, if our knowledge and invention were progressive we should want the one for use and the other for emulation. In poetry we do not want the poets of our own time to portray again the character of times long past, for in that we can take but small interest; but to portray our advancing knowledge and the good, striking, and dramatic characteristics of our own time, as Tennyson so transcendently did; and we must never forget the labour and study he undertook to perfect himself, for he learnt Hebrew to see how the Hebrew poets arrived at sublimity. I do not speak about ornament, whether carved or painted, for that is the business of the sculptor or the painter. I by no means wish to discourage architects from being painters, sculptors, and ornamentalists, so long as they are good architects as well; but it is absurd to give up the advancement of our own art for the sake of being

DABLERS IN THE ARTS

of others. I have said nothing about the art of planning, although that is a most important art, and in these days, where convenience is thought of more importance than anything else, it is the art by which most competitions are gained. No one can deny that it is a useful art, and may be a very impressive one, and I am sorry to say that in its highest form it is not sufficiently studied. I must say something on the results of our own examinations, for they have had a very stimulating effect on the students. The examinations let them know some of the things they ought to study, and give them an object to aim at. Examinations, however, have certain shortcomings like everything human, they test insufficiently. Besides a parasitic growth clings to them: they lend themselves to cramming, whilst to cram is the last thing we should wish any architectural student to do, for it is a pure effort of memory to recollect what has been before written or said and repeat it at a given time, while the

great object of instruction is to teach people to think and act properly. The sort of memory architects want is for the thing to be remembered to be firmly and permanently fixed; while anything crammed, when it has once answered its purpose, is almost immediately forgotten, and leaves scarcely a trace behind. Architecture in every one of its three branches requires accurate thinking to the end in view, and no cramming is of the slightest use in that direction. The only use I ever heard claimed for it is that it enables a man to seem to know what he does not know, which may be useful on occasions.

THE PLAN OR ARRANGEMENT OF A BUILDING

requires to be made perfectly suitable for its purpose, and in the cases when the building is not for common use it should have a certain effect, and if for high purposes the forms require to evoke feelings of dignity, stateliness, sublimity, or awe. I cannot refer to more perfect examples than the Parthenon and the inside of the Pantheon. Plans embody not only the general conception of the building and its supports, but should roughly inform a skilled person of the whole scheme of the completed building. We judge of the constructional skill of the architect by the smallness of the ratio of supports to the total enclosed area. Every one of the three branches of Architecture is not only sufficiently difficult, but may be considered transcendental, e.g., when we look through many plans we see that some are not only more convenient and more striking than others, but sometimes it seems as if the great planner were first and the rest nowhere. As buildings are meant to stand, it has always struck me as rather a paltry trick to arrest attention, to make a building look unsafe, or to put in a piece of construction which forces us to ask how the architect has managed to make it stand. We want everything to look stable, so that our whole attention may be given to the æsthetic effect; but at the same time skill in construction will enable us to give great

VARIETY IN THE DIFFERENT PARTS

of the building, some parts being slight or slender as compared with the important members of support, which must necessarily be bulky. No building should be put up that has not some evidence of the intention to make it comely, unless it be those buildings that are intended to convey horror or antipathy, of which I spoke before. Every building wants character, and that character should show its use; and when buildings are for the purposes of dignity, reverence, or awe, it is most important that their proportions should excite these feelings, and that any sculpture or painting that is put on them should heighten their effect in the same direction. Although it may seem a paradox to say so, the special convenience that should attach to every building is not so important in the highest sort of monuments, as for the monument to excite a feeling of sublimity, and for this reason that high thought clothed with beauty is much more lasting than ordinary wants. If we could call to life the High Priest of the Parthenon he might tell us that Iktinus and Kalikrates made the Temple

VERY INCONVENIENT FOR THE SERVICE,

but for more than fifteen hundred years that service has been abolished, and we are still enamoured of the sublimity of the temple. The principal things that want teaching when construction and the art of planning have been mastered are the proportions that have raised the various emotions in existing buildings, the art of moulding and the exercise of the inventive faculties, for it is doubtful if invention is denied to any average human being, although some have it in such profusion that it is easy to them to invent, and you probably recollect Plato's saying that those entrusted with public duties should find them easy. I have so often said before, the construction should be the best that is known and practised, and that any construction that is used merely because it is old is mere pedantry. In every new building we arrange, difficulties arise in giving the necessary parts that æsthetic expression that we wish them to

* The inaugural address, delivered by the President of the Royal Institute of British Architects, at the first general meeting of the session 1898-99, held on Monday, November 7th, 1898.

have. It is comparatively easy to mask the construction so that we may use the æsthetic solutions of deceased Architecture, and so long as we pursue this course Architecture can never advance. What should be done is to encourage the student to solve the difficulty in his own way, and that is

WHY IRONWORK IS SO SERVICEABLE,

because in that the student has nothing to copy from, and he must use his inventive powers. Very long columns and stanchions, for instance, have junctions that must be kept together by ugly lugs and bolts or some other cumbersome addition, and these have to be made graceful or beautified. There are difficulties about moulding in iron, and in trying to solve these difficult problems the student should be recommended to aim at simplicity and elegance. If after many trials he cannot do anything towards a solution of these problems, he should abandon Architecture. As regards the practice of some of the younger members, there is too much straining after effect; too much recourse to easy means of arresting attention, such as by rustics; too much partiality for curious and incongruous forms; the sewer-arch or water-opening is too much adopted for entrance doorways and attic windows—anything for a novelty! corners of square openings are rounded off, and projecting members are slightly curved or bellied out. Now there is, in my opinion, nothing like straight lines for dignity, and the rounded corners and bellied door and window heads mostly produce meanness. Another device is to make columns like those barrels that are used to fill in the odd spaces in ships, where the middle diameter is nearly double that at the base and necking—

A GROSS AND VULGAR CARICATURE

of the entasis of the Greek columns. This device truly arrests attention, but only to make the judicious observer note the absence of any feeling but for vulgarity. Architecture is a very difficult fine art, and these attempts to attract attention easily, merely show want of proper training and laudable ambition. Horace's maxim is as true now as it was then, that "you should study Greek examples by day and by night." The simplicity, grace, and restraint of Greek work cannot be too much studied, and that profusion of ornament that is now so common is not only opposed to Greek practice, but to good taste, for, as it has been truly observed, nothing great is obtained without simplicity. There is one feature we want badly, and that is a well-designed large window, for there is great demand for these in the new public buildings, and we have nothing but the huge Roman semicircular window of the Baths, and the west end perpendicular windows, which have little claim to beauty. There is a

GREAT WANT OF STUDY OF LIGHTING;

half the effect of large complex interiors is got by concentrated light against "a mighty contiguity of shade," while most of our buildings are spotted all over with windows. One of the architectural devices the student should study is to get harmonious grouping of immense windows with those of ordinary and small size, and another is how to treat the problem of the seventeen-story building; for though we have not yet adopted this American device, the increasing scarcity of ground and price of land in large cities tend to produce it. The only use of these addresses is to correct mistakes in teaching, to point out, if one can, where the defects in our practice lie, and to stimulate each other to greater exertion, and if possible to find out the way to the advance of our art. The chief things that act as incentives to mankind are the hope of wealth, the hope of honours, and the hope of immortality; and I certainly think that we might well increase one incentive by insisting on being paid for our work, for we are not paid now. I think the powers that be might well make another incentive more common by bestowing honours on the Profession, which is now hardly recognised, although it does so much to raise the reputation of the nation by designing monuments which persons from all parts come to see. I can only hope that the prospects of immortality may induce those with congenial genius and the highest

ambition to devote themselves to Architecture, and to spare no thought and no labour in perfecting their work, so that it may vie with the best Greek work in grace, and with the Mediæval in impressiveness. We all wish that a great architectural genius may arise, for the sake of our art and of our country; and it is good for everyone but the genius, for his highest traits are mostly brought out by misery. As Shelley says, "We learn in suffering what we teach in song." I think, or at least hope, that with all the present teaching, striving, and devotion, we shall find the true path of progress, and that in the near future Architecture may realise the transformation of the dragon-fly:—

To-day I saw the dragon-fly
Come from the wells where he did lie.

An inner impulse rent the veil
Of his old husk: from head to tail
Came out clear plates of sapphire mail.

He dried his wings: like gauze they grew:
Thro' crofts and pastures wet with dew,
A living flash of light he flew.

Colonel Prendergast, in proposing a vote of thanks to the President, congratulated him upon the honours that had been showered upon him during the last year. He had not only gained the blue ribbon of the Academy, but, what was more striking to them, he had again been elected to the presidential chair of the Royal Institute. The speaker passed on to the subject of the Californian University Competition, commenting on the French School of Architecture, which had carried the position. He had the profoundest admiration for the French system. People were always talking about originality; he would like to know what originality was worth unless they knew the science and grammar of their art. It was here where they were doing the greatest mischief—to tell the young men of the profession who, like all other young men, would like to shirk the duties of life, that they might start a style of their own and ignore the work of those who for centuries past had been making the Profession what it was to-day. The public required to be educated on this subject, and he did not see how it was to be done if architects were not educated themselves. To suppose that they could invent a new style was the most ridiculous thing that ever entered man's head. Architecture *nascitur non fit*. He was perfectly convinced that he was the greatest enemy of the rising young men of the present day who told them that they were fit to start and lead the world to something better. The most refined, the most artistic of European peoples had this cancer starting amongst them; one of their publications, *L'Illustration*, had been giving illustrations of "the coming style." Anything more ludicrous, anything more detestable, it was impossible to conceive. The writer on this subject charged full tilt at the architects who, he said, were tied and bound by their worn-out doctrines and terribly refractory styles. The new school were the valiant pioneers of the ideal, who pushed forward manfully in the *melée* and produced works—original works—which proved more eloquently than words what the modern style would be. Colonel Prendergast finished with a brief reference to the subject of iron construction.—Professor Roger Smith seconded the vote of thanks, taking up the previous speaker's theme.—Professor Smith said he did not believe in

THE POSSIBILITY OF A NEW STYLE

being adopted in the present day, except on the suggestion of new materials and new wants which might modify the present form of building. We were filled with the forms, our minds with the knowledge, our eyes with the sight, our memories with the recollection, of the buildings which covered the West of Europe. It was impossible to build without remembering these buildings, and it was impossible for the public to admire buildings without thinking of the forms which had been wrought out with the utmost pains at different periods; and he believed that for some time to come originality must mean not new features,

but some new modification of existing features, with possibly new combinations. As to new proportions he felt a little misgiving. The illustrations of the professional journals showed what progress was being made in building to-day. It was a quiet advance, but an advance they must recognise; he felt sure it would continue with the years.—Mr. William Woodward, before the vote of thanks was put, interposed with an appreciation of Messrs. Brydon and Young, as the architects for the new Government buildings. He regarded this matter as the most important architectural event of this age, and the non-mention of it in the President's address as a serious omission.—The President briefly acknowledged the vote of thanks.

The President prefaced his address by an allusion to the death of M. Charles Garnier. The Institute did him the honour some years ago of bestowing upon him the Royal Gold Medal, and that with great justice, for certainly M. Charles Garnier had given a new expression to French Architecture. French Architecture had peculiarities of its own, but M. Charles Garnier had added a new leaf to its laurels, and they all felt extremely sorry that he had been carried off—not at a very early age, but yet too soon for one who shed light upon the whole civilised world. When they recollected that the architect of the great library at Venice attained the age of ninety-three, and had not then taken to spectacles, they might consider that M. Charles Garnier had been cut off many years before his time. But he was a man of nervous organisation, and with the heavy labours put upon him, especially in connection with the Opera, his health could not withstand the strain.—Mr. Aitchison was sure they would all join in a vote of condolence to France and the French Academy.

MR. W. WESTLEY MANNING has, at the Clifford Gallery, in the Haymarket, a number of oil paintings of pastoral and coast scenery in England, Holland, and Brittany. They are delicate in colour, tender in their tone relations, dainty in treatment, and they show a distinctly sympathetic attitude on the part of the artist towards the gentler aspects of nature. For the most part, the subjects they illustrate have been well chosen, and cover a good deal of ground, so that the exhibition has a very satisfactory air of variety. It is a pleasant display of work which has in it many of the elements of popularity.

At the last week's meeting of the London County Council, Mr. Benn, chairman of the Highways Committee, asked permission to withdraw a report of his committee recommending the Council to expend £1100 in making the necessary alterations to the Victoria Embankment wall to enable the Boadicea statuary group presented by Mr. J. I. Thornycroft to be placed in position. Mr. Benn said that a letter had been received from the Office of Works asking to be furnished with particulars of the proposal of the Council to erect the statue, and pointing out that under statute it was necessary for the Office of Works to give their written consent before any statue was erected in London. The report was then withdrawn.

THE Bishop of London was the principal speaker at a meeting at Peterborough to raise further funds for the restoration of the Cathedral, the Marquess of Exeter presiding. Mr. Bodley, the Chapter architect, said the south-western gable first required attention, and it was becoming very shaky. He proposed to work on very conservative lines. The arch would not be taken down, as in the case of the north-western gable. The Bishop of London congratulated the Dean and Chapter upon the successful completion of the work already undertaken. There had been adverse criticism, but the original beauties of the cathedral had never been tampered with, while the fabric had been put into substantial repair. Dean Ingram stated that during the last fifteen years over £40,000 had been spent on the restoration of the fabric, and a further £10,000 would bring the work to a completion.

SOME INTERESTING FURNITURE.

MESSRS. COLLINSON AND LOCH, of Oxford Street, the well-known firm of decorators, furniture makers, and manufacturers and dealers in art fabrics, are about to amalgamate with Messrs. Gillow, the old-established firm of decorators and upholsterers, whose foundation dates back to the last century, and who, beside a large connection as house furnishers, are one of the largest cabinet makers in this country. Prior to their removal from their Oxford Street premises, Messrs. Collinson and Loch have organised a sale of part of their stock, which sale opened on Monday, the 7th inst. This sale is well worth the attention of all who like soundly designed and carefully made furniture, and the rich parquetry and inlay, of which this firm has made a special feature, will be, in particular, admired. The furniture offered comprises, among other pieces, those which have distinguished Messrs. Collinson and Loch's showrooms during the past, including several cabinets and tables in ivory inlay, which have been specially designed and made for various exhibitions of late years. These pieces have been designed by experienced and well-known artists, and executed by specially trained craftsmen, who in many cases have been educated in Messrs. Collinson and Loch's own workshops; and their value as unique works of art, and the nature of the skilled labour lavished upon them, makes it impossible to offer them on such terms as are met with in ordinary selling-off sales of stock furniture, but a substantial reduction has been made in each instance as the circumstances warranted, as may be seen on a reference to the illustrated priced catalogue just published by the firm, which gives in each case the original price of the various pieces, and that at which they are offered during the sale. This catalogue has been prepared with great care, and with its illustrations constitutes a record of considerable interest and value for the connoisseur of furniture. Messrs. Collinson and Loch have in their collection examples of almost all the latter styles of furniture design, not to mention one or two examples in the Jacobean manner, and contemporary Continental style. They have for sale, in particular, many developments of the French fashion of design in the last century, and some excellent reproductions of our own Sheraton work and other English furniture of about the same date. Messrs. Collinson and Loch's method during the last few years has been, first, to make exact copies of any particularly fine examples of old furniture which they may be so fortunate as to secure, and second, to elaborate and compose new pieces in the feeling and according to the lines of the best examples. It is in this department of their art that the firm is best known, and particularly with reference to their inlaid designs, and, above all and foremost, in their inlaid ivory cabinets and tables. These, in most instances, have been designed by Mr. Stephen Webb, and executed with a delicacy and precision, by Messrs. Collinson and Loch's employés, which could not be surpassed in the work of any epoch of cabinet makers. It will be of particular interest to architects to know that it was for this firm that Mr. Thomas Colcutt did his first work in furniture design, for which, twenty years ago, his name was famous. One or two of his pieces may still be seen at Oxford Street, though most of them have been sold long ago, and it will surprise the visitor to notice how widely Mr. Colcutt's ideas have been assimilated and incorporated in the designs of the wholesale cabinet makers of the present day.

On the roof of a brewery at Maidstone is to be seen one of the most remarkable vanes in England. It represents an old brown jug and glass. The jug, which is made of copper, stands 3ft. 6in. in height and 3ft. in diameter, and is capable of holding 108 gallons. The glass, also of copper, has a holding capacity of eight gallons.

OXFORD IMPROVEMENTS.

FOR the past few years the building operations in Oxford, following a period of considerable activity among the colleges and University institutions, have been comparatively few and unimportant, with the exception of the new Town Hall, and during the twelve months just elapsed the work calling for attention is even less than usual. One or two works of some magnitude have, however, been commenced. The principal of these is the new home for the Radcliffe Library, which is now housed in the University Museum on the first floor facing west. The space occupied by the unique collection of books is urgently required for other purposes, and by the generosity of the Drapers' Company a suitable building is about to be erected for the purpose, the sum which the Company are prepared to contribute being variously put at from £15,000 to £20,000. The new building will be on the south side of the Museum, facing South Park Road, and the foundations up to the ground floor level have just been put in by day work, for the Drapers' Company, by Mr. E. Long. The total length of the south front is 134ft., and the width 39ft. 2in. In the basement will be a store room 90ft. by 27ft. 4in. It is understood that a three-story building will be erected, and the principal staircase will be approached from the south front, and there will be a connection by means of a passage with the old library. Mr. T. G. Jackson, R.A., is the architect, and Clipsham stone, with Gibraltar facing, is being used. Among the other work in connection with the college it is interesting to note that

KETTLE HALL

in Broad Street, which was formerly the residence of Dr. Mee, has been converted into a part of Trinity College, and arranged for six additional sets of rooms. The hall was built by Dr. Kettle, President of Trinity, 1597-1643, as an annexe of the college, and is therefore now restored to its original use. Dr. Mee is now in residence in a large and handsome house in Queen Anne style, which he has had erected at the corner of Mansfield Road and Jowett Walk. One of its features is a spacious music room, about 30ft. by 20ft. There is a very fine hall with an elaborate staircase and a beautiful fireplace. The material used is Deddington stone, and the roof is covered with Broseley tiles. Messrs. Symm and Co. are the builders, and Mr. B. Jackson, of London, was the architect. The Robinson Memorial Tower at New College was formally opened on June 25th. It rises to a height of about 80ft., and contains two lecture rooms and six sets of undergraduates' rooms. The tower forms the central feature of the new block of buildings in Holywell Street. The tower which it is proposed to erect at

ST. MARGARET'S CHURCH

will be a prominent feature in that part of Oxford, rising as it will between 80ft. and 90ft. Mr. H. R. Franklin, of Deddington, is at present putting in the foundations. The walls will be 4ft. thick, and the inside measurement is 13ft. 6in. square. Mr. G. F. Bodley, A.R.A., is the architect. The chancel roof of Holywell Church has been recently redecorated, and is much admired. The arrangement of the forty-five square panels is as follows:—In the centre of the vault at the east end of the roof a panel is filled with a design of a gold chalice on a blue ground, surrounded by white flowers. The adjoining four panels each contain an angel on a blue ground. These five panels form a cross. Around these are panels filled with designs of flowers on a white ground. There are four different designs—Iris, Crown Imperial, horse chestnut, and briar roses—which are repeated, but with different gradations of tone and colour. At the west end of the roof another five panels have blue grounds, but without figures. They have instead a cruciform pattern of white datura flowers. This second series of blue panels carries on the blue in the colour scheme, but with a lesser accent than the one containing the angels. The latter are painted with wax medium on canvas, and are fixed on to the roof by means

of a bed of white lead. The rest of the roof is painted also with wax medium, but on to the plaster, which, however, was first coated with white paint. The painting was done by Mr. Henry Strachay from designs by Mr. E. P. Warren, architect. The Oxford Gas Company has during the year completed several sections of the entire rearrangement and enlargement of its works according to the plan decided upon some time ago. A large and lofty building, 170ft. long and 62ft. wide, has been built on the site of an old gasholder, and some offices and a dwelling-house. The contractors for the supply of the purifiers, valves, and apparatus were Messrs. C. and W. Walker, of Donnington, Shropshire; and, for the fencing, Messrs. Isons, Kidman, and Watts, Oxford. The most noteworthy change in Cornmarket Street is the erection of a commanding building of bright red brick and terracotta, highly ornamented. A handsome design for the clock to be erected on the Plain, St. Clement's, has been submitted for approval by the architect, Mr. P. E. Warren. The fountain is under a roof of oak, supported by columns, and above are three dials illuminated by electricity. The steps and fountain will be of York and Portland stone, lined with copper, the columns and dwarf walls of Milton stone, and the roof of oak covered on the outside with Stonesfield or Naunton stone slates. The Corporation has carried out several special works during the twelve months under the direction of the City Engineer (Mr. W. H. White).

TAR MACADAM ROADWAYS

have been made in substitution for granite setts and pebble pitching at Carfax, Bear Lane, and near to St. Peter-le-Bailey old churchyard; and in substitution for ordinary macadam at the west end of Cowley Road, and at the east end of High Street, in which latter place the tramway lines and sides have been paved with McDougall's patent setts. The street extensions include Hill View Road, Frenchay Road, Heyfield Road, and Museum Road, and Jowett Walk has been completed, so that there is now a thoroughfare from Mansfield Road into St. Cross Road. In connection with the latter work, the remaining portion of the eastern section of Love Lane has been closed and absorbed into the adjoining properties. A further extension of Frenchay Road has also been planned, and the present lane leading from Heyfield Road to the Swing Bridge will be closed and built over. The works at Carfax Tower being finished, the improvement has been completed, as far as the street is concerned, and the surface paved with York flagging. The western end of Queen Street has been widened, and the new public garden on the site of the old St. Peter-le-Bailey churchyard finished, planted, and thrown open for public use during the past summer.

SEWER AND SURFACE DRAIN EXTENSIONS

have been made in Hill View Roads, Frenchay Road, Jowett Walk, Heyfield Road, Bear Lane, and Avenue Lane. Extensive works of storm water relief drainage, at a cost of about £1800, have been executed in South Park Road, Parks Road, Museum Road, St. Giles' Street, Mill Street (Osney), Bevington Road, St. John's Road, Walton Well Road, Jackdaw Lane, and St. Aldate Street, with a view of minimising the flooding during the severe storms which have several times visited Oxford during recent years. Another important improvement in the surface water drainage has been carried out by building a large culvert in lieu of an old and ruinous one in High Street along the frontage of the Botanical Gardens, at a cost of upwards of £300, and an arrangement has been made there whereby the small quantity of water entering the culvert in dry weather can be diverted into the sewer, while the storm water will overleap the outlet, and flow into the river as before. The plans, specifications, estimates, and quantities have also been completed for the sewage utilisation works required on the Sewage Farm extension. Contracts have been entered into amounting to nearly £10,000, and the works will be commenced immediately.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

November 16th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE gas explosion at the Capitol, in Washington, is a distressing piece of news. Despite certain extravagances of style and the fact that what was planned and commenced in marble has been finished in stucco, the Capitol is a building of great beauty and even greater impressiveness, while of course it is instinct with historical associations of supreme interest. The Supreme Court room, which is wrecked, was a beautiful room, formerly used as the Senate Chamber.

THE projected removal of the famous Ponte Vecchio, or Old Bridge of Florence, the only one now left of any importance, with its mediæval houses lining either side of it, is creating a great stir in the artistic world, both in Italy and the rest of Europe. A committee has been formed for the "Protection of Old Florence," which includes amongst its members the most illustrious Florentine names, and a circular has been sent out to all parts of Europe soliciting signatures against this act of vandalism.

THE work of strengthening the foundations of the old St. Stephen's cloisters at Westminster, which was entered upon as soon as the Session closed in consequence of the discovery of some serious cracks in the superstructure, is now almost completed. First taking the precaution to shore up the defective wall with stout balks of timber, the workmen excavated underneath and for some distance around the parts which were giving way, and then, upon a bed of concrete, underpinned the wall by inserting iron girders. So far all is well; but before long other sections of the cloisters, which it should be borne in mind are a remnant of the old Palace of Westminster, destroyed by fire, will have to be similarly treated.

THE Dean and Chapter of St. Paul's has just unveiled the latest of Sir William Richmond's triumphs in the decoration of St. Paul's Cathedral. Consisting of the finished decoration of one of the "saucer" domes in the choir, it exhibits Sir William Richmond at his best, alike as an artist and a symbolical teacher. The general theme of the treatment is Christ reigning upon the Cross, and the world being represented as a wheat field with a fountain of life flowing through from the tree of life beneath which Adam and Eve are discovered kneeling.

THE lectures on Venetian painting which Mr. Roger Fry is giving every Wednesday afternoon at the late Lord Leighton's house are having a decided and deserved success. It is now hoped that Mr. Fry will continue the series after Christmas, and may thus be

enabled to develop the treatment of his subject, particularly his analysis of individual painters, at greater length. The only disappointment, indeed, felt hitherto by his hearers has been in the consciousness that the lecturer was omitting, through pressure of time, a good deal which they would like to have had. The third lecture included, among other things, a lively and sympathetic appreciation of Carlo Crivelli. Between this great painter's Art and that of the late Aubrey Beardsley, Mr. Fry, at the end of his remarks, drew a comparison as discriminating as it was unexpected. Both, he said, belonged to a class of artists—rare, indeed, but strongly marked—whose work has a consistent logic and unity of its own, though it is not that of nature.

THE old Irish Cathedral of Clonfert has latterly received a good deal of attention as the result of an effort to raise funds for its restoration. A good deal of restoration has already been carried out—details are given in our Professional Items column this week—and now the work is hindered for lack of resources, pecuniarily. The restoration of the chancel is almost finished, and it is estimated that £1000 will complete the restoration of the nave. Clonfert Cathedral, to which we devoted a short article some time ago, is particularly interesting. It was founded by St. Brendan, in the year 558; thirty-nine years before St. Augustine landed in England. The doorway, of Hiberno-Romanesque Architecture, dates from the year 1166. The east window is nearly a thousand years old. The cathedral is small, but very beautiful in many respects. It is now used as the parish church. The south transept is in ruins and roofless. The north transept is completely gone. Clonfert at one time was a city and celebrated for its schools. It is now not even a village. In the reign of Queen Elizabeth, before Trinity College, Dublin, was founded, it was proposed to found the University in Clonfert.

IN the year 1175, when Roderic O'Connor, King of Ireland, carried on his negotiations with Henry II. of England, the Abbot of Clonfert was one of the ambassadors sent by him to Windsor. Clonfert Cathedral suffered greatly from the incursions of the Danes, who frequently sailed up the river Shannon from Limerick and attacked it. It was burnt six times during 744—1174, and was plundered three times between the years 949—1065. In the year 1541 it was almost totally destroyed. Bishop Wolley repaired the cathedral in 1664. Since that time up to the present, a period of over 230 years, some alterations and improvements have been effected, but no general work of restoration has been done, until this which has been recently commenced, consequently the building is greatly in need of repair. The preservation of a Cathedral, the existence of which connects the present with the past—the nineteenth century with the sixth—is a work of more than ordinary interest, and one which will commend itself to the approval of all.

THE exhibition, which is now open at the South London Art Gallery, of the works of noted draughtsmen of many schools and periods, has something more than a merely curious interest. It is not only a collection which shows amusingly the contrasts between artistic devices of different dates, and makes intelligible the evolution of modern illustration; but it has also a definite educational importance as a means of comparing the relative values of the different processes by which the original drawing executed by the artist can be reproduced, and made accessible to the greatest number of his admirers. In these days, when illustrative activity is so great, such a show cannot fail to be helpful both to the profession and the public, for it explains many things which the inexperienced person might fail to realise, and it accounts for much of the variety in processes which is a feature of our times. The manner in which the draughtsmen have suited their style of execution to the necessities of the reproducer, and have adapted themselves to the demands made upon them, can also be plainly traced, a matter of great moment to the student.

APART from the educational aspects of the show, there is a very sufficient reason for its existence. Simply as a display of Art work it completely justifies itself, and makes a strong appeal to the public. The original drawings alone, without the prints produced from them, are thoroughly attractive, and artistically of great moment. An original work by Durer, designs by Cruickshank, Phiz, Seymour, and Leech, and a long series by such deceased artists as Lord Leighton, Sir John Gilbert, Sir John Millais, A. B. Houghton, Pinwell, Du Maurier, and Fred Walker, and by such living men as Sir Edward Poynter, Mr. Holman Hunt, Mr. F. Sandys, Mr. Luke Fildes, Mr. J. W. North, Professor Herkomer, Sir John Tenniel, and Mr. Phil May, combine to make up a collection of peculiar significance and of the possible public interest.

IN the course of planting operations on the estate of Mr. H. C. A. Day, Walta Park, near Clevedon, the remarkable discovery has been made of what is supposed to be the grave of an ancient Briton. The grave, on being opened, was found to be nearly full of fine soil, which contained some arrow heads, also portions of the skeleton of a man of above the average height, probably 6ft 2in. or 3in. The grave consists of five stones, the upper or covering stone weighing upwards of a ton, while the bottom is paved with irregular flat stones. The grave was found at a depth of 18in. from the surface. A stone celt, or axe head, in excellent condition was also found near by a few days previously.

THE Cardiff Museum and Art Gallery has received a gift of pictures, prints, and porcelain, valued at £4000. The donors are Mr. Charles Thompson and Mr. Herbert Thompson, of Cardiff, executors of the late Mr. James Pyke Thompson, founder of the "Turner Gallery" at Penarth. The collection now handed over to the museum consists of eighty-eight water colour drawings, twelve oil paintings, eight pastels, forty-three etchings and engravings, and sixty-four pieces of porcelain. Most of these have been on exhibition at the Cardiff Museum for several years as a loan collection. To this collection the executors have added a number of valuable drawings and etchings from Mr. Pyke Thompson's private gallery, which have been selected at their request for this purpose by Mr. W. M. Rossetti, Mr. Frederic Wedmore, and Mr. T. H. Thomas. The intention of the original owner of this collection was to bring together a series of examples illustrating the development of British Art in several departments during the last 100 years. Its value will for this reason be best appreciated by Art students. The oil paintings include a unique example of George Romney's work, entitled "The Bleaching Ground," "Cardigan Bay," by David Cox; and "Gipsies Resting," by G. F. Poole, R.A. Among the watercolours are eight sketches by Cox, and a fine drawing of "Ewenny Priory" by J. W. Turner. The collection of porcelain includes several beautiful examples of Nantgarw and Swansea ware, on which the best Art of Billingsley has been expended, and will considerably strengthen the exhibit of local pottery, which already constitutes an important feature of the Cardiff Museum.

A MEMORIAL to the late Christina Rossetti was dedicated in Christ Church, Woburn Square, by the Bishop of Durham last week. The memorial consists of a reredos, in which are five paintings of the Saviour and the Evangelists, designed by Sir Edward Burne-Jones, single figures of great beauty and splendid in colour. The architectural setting is of "Perpendicular" Gothic, designed by the Vicar of Christ Church, Mr. J. J. Glendinning Nash, and executed by Messrs. Walker and Sons. In the pavement in front of the memorial will be inserted a slab of marble from one of the ancient Roman quarries, with the following inscription: "The above paintings, designed by Sir E. Burne-Jones, Bart., are dedicated to the glory of God and the loving memory of the late Christina Georgina Rossetti, who worshipped in this church, and fell asleep in Jesus, December 28th, 1894. 'Give me the lowest place.'"

We are afraid that the extraordinary carelessness of the authorities of the Rembrandt Exhibition in Amsterdam will make people who own valuable pictures very chary of lending them. One of the finest Rembrandts in existence, the famous "Esther, Haman, and Ahasuerus," which belongs to King Charles of Roumania, was placed against a wall in which a projecting nail had been left, and is now irretrievably damaged. It will, we fear, be very little consolation to King Charles that he has been awarded £400 as compensation. The carelessness which made such an accident possible is inexcusable.

The landscapes in oil and watercolour by Mr. Oliver Hall, which are to be seen, with a series of his lithographs, at Messrs. Dowdeswell's Gallery, have a very marked technical character that will appeal to everyone who craves for something more than the merely literal interpretation of Nature. They are in manner definitely decorative, and give an abstract suggestion of illusive effects of atmosphere and light and shade rather than a minutely exact expression of easily observed facts. They have, in consequence, a peculiar charm, a touch of romance that comes as a delightful relief to the prevailing materialism of modern Art; and they mark the artist as one of the few masters of style that the present day school has produced.

MESSRS. A. and C. BLACK will shortly publish an interesting work on the Rock Villages of the Riviera, by Mr. William Scott. The book will deal with some of those picturesque and out-of-the-way hamlets which visitors to the South may have seen perched on hill-tops or hidden in the valleys, away from the beaten track of tourists. The district referred to is that part of Liguria which commences at the French frontier; and a brief historical outline traces the origin and development of these little "Villages"—as they were called—from the early days of the Genoese Republic, through the interesting period when some of them, revolting from the oppression of Ventimiglia, formed the "Community of the Otto Luoghi," and proceeded to carry out their ideas of Home Rule. Several of the villages still possess a number of their old documents, account books, and other records, and these are now laid under contribution for the first time.

ANDREW MARVELL is to have from the hands of the London County Council a commemorative tablet on the boundary wall of Waterlow Park, next Highgate Hill, to mark the site of his cottage. The inscription runs: "Four feet below this spot is the stone step formerly the entrance to the cottage in which lived Andrew Marvell, some time M.P. for Hull, and Latin under-secretary, patriot, poet, wit, and satirist. Born 1620, died 1678. He was buried in St. Giles-in-the-Fields. This memorial brass was placed here by the London County Council, November, 1898." When the cottage was pulled down some years ago, Sir Sydney Waterlow had the stone step built into the boundary wall.

SIR WALTER BESANT, lecturing the other day upon "Norman London," observed that London originally stood in the centre of marshes, part of which extended over the area of Southwark and Battersea. The London of that period contained within the City walls 136 parish churches, all of which, as their dedication showed, were built by the Saxons; and a population of from 100,000 to 120,000. One point worthy of noticing was that in the 12th century, a river wall ran through the middle of Thames Street. It was built on the edge of a cliff some 12ft. to 14ft. high, and along the foreshore which was reclaimed quays were erected for the landing of commerce. On the south of Cheapside were numerous narrow streets, built without the slightest regard to alignment, in which the riverside population lived. The Cheapside of that day was very different from the great thoroughfare as we know it. It consisted chiefly of a market similar to that of Covent Garden, while on the stalls various articles were for sale. No vehicles passed through, all the carrying being done by pack horses. The two forts

built by the Normans, viz., Baynard's Castle and the Tower, were intended to allow the King free access to the City whilst overawing the citizens.

A JOINT report for presentation to the London County Council has been prepared by the Improvements and Housing of the Working Classes Committees respecting the Holborn to Strand and Clare Market scheme. The following recommendations are made: (a) That, having regard to the nature, extent, and importance of the Holborn to Strand improvement and to the special circumstances connected with the case, the Improvements Committee shall, notwithstanding existing references to the committees, be charged with the clearance and laying out of all property comprised in the Clare Market scheme and of the whole area between Holborn and the Strand, the sites agreed by the two committees to be set apart for working class dwellings being subsequently handed over to the Housing Committee. (b) That the Housing Committee do supply information to the Improvements Committee as to any negotiations now on foot for the purchase of any property on the Clare Market area. (c) That it be referred to the Finance Committee to make any necessary re-arrangement of the accounts between the two committees. (d) That the Improvements Committee do consult the Housing Committee when formulating any street improvement which would appear to involve a scheme for rehousing the persons of the labouring class to be displaced, or when preparing for submission to the Home Secretary any rehousing scheme in connection with a street improvement sanctioned by Parliament and undertaken by the Council.

THE pictures and other objects of Art and decoration, the property of the late Sir Richard Quain, Bart., M.D., have been sold at his late residence, 67, Harley Street, by Messrs. Samuel B. Clark and Son. The large and well-known gallery picture, "All Hallows Eve," by David Maclise, R.A., realised 205 guineas; and a portrait of a black and tan terrier, by Sir E. Landseer, 225 guineas. The same sale included also a small square of old tapestry, which realised 350 guineas; and a Sèvres tea service of eleven pieces, richly gilt on a green ground with beautifully painted panels, presented by Queen Amélie to the late owner, 52 guineas.

MR. W. WALLACE BRUCE, chairman of the Housing Committee of the London County Council writes:—Up to the present time the London County Council has only built dwellings to rehouse persons displaced by its schemes for the clearance of unhealthy areas, and by the construction of the approaches to the Blackwall Tunnel. In both of these cases the plans of the dwellings have to be submitted to the Home Secretary or to the Local Government Board. These authorities have a very high standard, and dwellings on the plan of many of the Guinness buildings would not receive their sanction. It is impossible to build up to this high standard, and at the same time to charge very low rents, unless a portion of the rent is charged to the ratepayers.

"ST. AUGUSTINE'S CHAIR" will be exhibited some time in December by the Rev. Dr. Cox, F.S.A., at Burlington House, at one of the sessions of the Society of Antiquaries. Over sixty years ago there stood in the corner of the basement of the pre-Norman tower of the Church of Stanford Bishop, near Bromyard, an old decrepit oaken seat or settle. It had been moved there early in the present century because it was considered too common-looking for the chancel, where it used to stand. Local tradition not only called it Augustine's chair, but stated that it was used by St. Augustine when he was missionary in those parts. During a comparatively recent restoration of the church, the masons, wanting a fire, were about to break up the old chair, but the parish clerk begged it, and placed it in the garden of his cottage. From this forlorn position it was rescued, in 1888. This is not, of course, the "Chair of St. Augustine" to be seen in Canterbury Cathedral.

ARE ARCHITECTS' ASSISTANTS UNDERPAID?

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—It was gratifying to read the letter of "Provincial Assistant," published in last week's number of your paper, and it is indeed pleasant to find that someone is at last protesting against the miserable underpayment of architects' assistants.

Although your correspondent's letter appears to be rather one-sided, it may be agreed that, as far as capable assistants are concerned, the Profession is not overcrowded.

It is to those persons, miscalled architectural assistants, who lack sufficient training, and are content with meagre salaries, as well as to those qualified men who are silly enough to give their services for little or nothing, that we owe this grievance.

One would think that some amount of organisation would put matters right. Could we not form an association, and have certain qualifying examinations for men who have served a term of years as pupils in architects' offices? There could be two or three grades with various classes in each grade, so that a student, passing first class second grade, would be engaged as a first class second grade assistant, and receive a salary not less than that arranged for him by the Association. Why should this be deemed *infra dignitatem*, as savouring of a trades union? Our principals have their scale of fees, why should we not have ours? Doubtless many difficulties would attend the formation of such an association, but it could be done if every assistant did his share in bringing it about. Many would be the advantages of such a union. Shall we quench the spark which has been lighted? Let us rather raise a voice which shall not easily be silenced, which shall rouse the Royal Institute and other architectural societies from their lethargy. Then will come architects' registration, and the tone of the Profession will be heightened. Then shall Architecture take her place as foremost in the fine arts, the most essential to our country's welfare, and become a lasting monument to the greatness of our nation.—I am, dear Sir, yours faithfully, "ANTICIPATION."

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I have read with great interest the correspondence in your columns upon the above subject.

I should like to suggest that the fault of small salaries being paid lies not so much with the employers as with the assistant himself. As an assistant of ten years' varied experience, I have found that, in the majority of cases, if a man is worth £3 3s. he can get it; but it is a waste of time a man getting £2 2s. (and being only worth it) to think he is worth double that sum. Speaking of a large proportion of assistants, one looks down the advertisement columns of the building papers, and there one sees frequently an assistant advertising, "Design, Supervision, Detail, Perspective, Quantities, &c., &c." salary £2 2s. It takes a lot of believing, sir, that a man with such a knowledge cannot command more.

On the other hand, architects themselves are to blame. They engage a person advertising as mentioned, only to discover that he is a dear man even at two guineas. There are many such assistants—indeed, I might almost say the majority—who ought never to have seen a T-square, and it is in this direction that we must look for a solution of the question. A combination is a wrong idea; we cannot have an "Amalgamated Society of Draughtsmen" putting good and bad on one level at so much per hour.

No, Sir, in my humble opinion, what governs salary is ability.—Yours truly,

"COMPASS."

LAST week Princess Christian opened the tenth annual exhibition of Amateur Art Work at the Imperial Institute. The display in all classes was very creditable.

Professional Items.

ACTON, W.—The Passmore Edwards Public Library, Acton, W., which is being erected by the District Council of Acton, with the aid of Mr. J. Passmore Edwards, is to be carried out in Portland stone for all parts to which the public have access. The plan shows that all the public rooms are on the ground floor, and that the maximum areas for these departments have been secured. The public entrance is located in the middle of the main front facing High Street, and leading into a central hall, out of which the various reading rooms as well as the lending library are reached. Facing the entrance to the left is the newspaper room, 50ft. by 30ft., having windows to the east, and a tall gable window at the south end of the apartment. Dormers for light and ventilation occur between the arched roof principals, and a ventilating turret in the centre is provided. Slopes will be placed under the windows round the room, and newspaper stands and tables will, of course, occupy the central area. To the right-hand of the visitor, and also facing the entrance, is placed the lending library, with good space for borrowers. This part of the building is lit by a glazed lantern. Mr. Sidney Powell, of Acton, has the work in hand as builder. The architect is Mr. Maurice B. Adams, F.R.I.B.A.

BIRMINGHAM.—The new church of All Saints, Birmingham, has been dedicated by the Bishop of Worcester. At present only the chancel and nave have been completed, and a baptistry and tower are to be added when funds will permit. The total cost already incurred amounts to £3300. The building has been erected by Messrs. Collins and Godfrey, of Tewkesbury, from the plans of Mr. J. A. Chatwin, Temple Row, Birmingham.

BRISTOL.—Extensive premises are being erected by Messrs. Ford and Canning in Baldwin Street, Bristol, to be known as "Canada House." The first portion of the block has already been built, and is almost entirely let, and the remainder, which will occupy the circular corner and extend a little way into Queen Charlotte Street, is expected to be ready for occupation by the end of the coming spring. The style of the building is more or less a continuation of the present block, that is a phase of Flemish or Dutch Renaissance. The materials used for the front are Cattybrook face bricks with dressings of orange rubber bricks and freestone. The roof will be of slate. The offices internally will be light and commodious, and will be provided with capacious strong rooms and sanitary accommodation of a high class. One wing will be set apart for the latter purpose. The floors consist of basement (to be used as a bonded cellar), ground, first, second, third, and attic. The architects are Messrs. Gingell and Bond, of Alliance Chambers, Corn Street, and the work is being carried out without the aid of a contractor, Messrs. Ford and Canning's own men being employed, under the superintendence of a building manager. The cost of the whole block will be about £10,000.

CARDIFF.—Cardiff has just been provided with a new Custom House of a neat if not very ornate design. The front wall is of Portland stone, and the sides consist of glazed bricks, relieved with Portland stone dressing. The total depth of the building is 94ft. The frontage to Bute Street is 40ft., and the elevation is the same. The premises are floored throughout with wood blocks. The staircases are of stone, with ornamental rails. The whole building, which was erected by Messrs. William Thomas and Son, contractors, Tresillian Terrace, Cardiff, from plans drawn by Mr. Banner, Office of Works, Whitehall, London, cost £5000.

DEVONPORT.—The St. Levan Wesleyan Chapel was last week formally opened. The building, which fronts Stuart Road, is constructed of limestone with Bath stone dressings,

in a simple style of late Gothic, having a capacity for five hundred sittings. The roof is of the open timbered character. Mr. W. N. Richards, architect, of Devonport, prepared the design, and the building contract has been executed by Mr. Kerswill, of Plymouth. Including the contract price, £2387, the estimated cost of the erection and furnishing was £2919.

DUBLIN.—During the last twelve months a considerable amount of work in connection with the restoration of Clonfert Cathedral has been carried out by Mr. A. P. Sharp, builder, of Dublin, to the plans of Mr. J. F. Fuller, F.S.A. Special attention has been given to the chancel, which is one of the oldest parts of the Cathedral—more than a thousand years old. This has been thoroughly repaired. The belfry tower, the buttresses, and the roof, have been also repaired. The sacristy has been successfully preserved without altering the ancient character of the structure. Other necessary work has been accomplished. A thorough system of drainage has been carried out around the entire building. Messrs. Craven, Dunnill, and Co., of Shropshire, have laid down tiles in the chancel. A new heating apparatus, supplied by Messrs. A. K. Fayle and Co., of Parsonstown, has been placed in the chancel. Through the instrumentality of a friend of the late Bishop Wynne, a carved oak communion table, specially designed by Mr. J. F. Fuller, F.S.A., has been presented to Clonfert Cathedral.

EAST HAM.—The foundation stone of the East Ham Free Library was formally laid on Saturday week. The library is to be built on the Plashet Recreation Ground, and the cost of erection is to be £4000. Mr. Sylvanus Trevail, F.R.I.B.A., is the architect.

GLASGOW.—The High School Building Construction Classes on Saturday visited the Glasgow slaughter-houses in process of reconstruction in Moore Street. The fencing throughout byres is of steel, hydraulic lifts replace the old-fashioned winches, and new steel roofing is likewise provided, so that when ultimately completed the new arrangements will place the building amongst the first of its kind. The work is being proceeded with by sections. Over forty students took advantage of the permission granted by Mr. A. B. McDonald, the city engineer. The cost, meantime, is over £30,000.

LOWESTOFT.—A new technical school (the only one of its kind in Suffolk, outside Ipswich) has been erected at a cost of about £7400 by the Lowestoft Corporation. The new buildings have been designed by Mr. George Leighton, architect, of Ipswich, in the Renaissance style, with a modern rendering of the Collegiate type. Effect has been gained by the massing and proportion of the various parts of the whole, rather than ornamentation. The features of the North or Gordon Road front are the boldly designed gables at each end, with the deeply recessed windows, the arched panels forming the heads being filled in with figure carving of bold and graceful lines. The main entrance is from Clapham Road, through vestibules (planned to exclude the cold air) to the spacious entrance hall with the attendant's office. The corridor, 9ft. wide, runs the whole length of the building. It is lighted from both ends and from the centre, and in addition by a large window on the grand staircase. A similar corridor gives access to the rooms of the first floor, and there is ample space for arranging specimen cases. The accommodation provided is ample and up-to-date. A very fine room is that devoted to the teaching of building construction, machine construction, and for some advanced subjects. The fittings throughout have been specially designed by Mr. Leighton for their respective uses and requirements. The heating work on the low pressure hot water system with radiators and coils have been executed by a Lowestoft firm, Messrs. W. J. Brooke and Co. The general contractor has been Mr. Arthur Bedwell, of Lowestoft. The masonry has been done by

Mr. Whitehead, of Regent Road, Lowestoft, and the whole of the work has been carried out under the personal superintendence of the architect.

NEWPORT.—The new Church of All Saints has been formally consecrated. The church has been built from designs of Messrs. Graham, Hitchcock, and Co., by Mr. E. C. Jordan, in Early English style, of Risca stone, with Bath stone dressings. It consists of a nave and two aisles, with a handsome, well-proportioned tower, and has seating accommodation for about 600 worshippers. The reredos, pulpit, lectern, reading desk, &c., are of oak, beautifully carved, the reredos especially being beautifully designed, and with carved figures representing the scene of the Last Supper. The contract for building was £6500, but the extras for furnishing, laying-out the ground, and other necessities has brought the total cost up to about £10,000.

PRESTON.—The Theatre Royal has been rebuilt. Full advantage of the cantilever principle of support has been taken, so that while a maximum of strength for the whole structure is secured, not so much as a solitary pillar deprives the audience of sight of the play. The heating of the building is effected throughout by means of low pressure apparatus; the lighting is by electricity. The architect was Mr. John P. Briggs, of Arundel Street, London; and those responsible for the many sections of the work are:—General contractor, Mr. Chas. Walker, Preston; artistic decorations, Mr. Bookbinder, London; electric lighting, Messrs. Vaughan and Brown, Ltd., London; upholstery, &c., Messrs. Gray and Co., Preston; seating, Messrs. Shoolbred and Co., London; heating and other apparatus, Messrs. Dilworth and Carr, Preston; gas plant, Mr. J. Edge, Preston; steel constructional work, Messrs. Foster Bros., and Co., Preston; general painting and plumbing, Messrs. E. Park and Sons, Preston; act drop, Messrs. Hicks and Brooks, London; tiling, the Porcelaine Tile Co., Cobridge; ceramic work, Messrs. Webb and Co., London; marble dados, Mr. Wm. Hodgkinson, Preston; stage machinery, Messrs. Lyons and Co., London; Glass decorations, Messrs. Clarke and Co., London; carving on elevation, Mr. Arrowsmith, London.

SOUTHWOLD.—A new bridge has been built at Southwold. The new structure has brick abutments, and retaining walls, the superstructure being formed of steel trough girders. The parapets over the span are of wrought iron lattice work; the width across the bridge is 26ft., and the waterway 20ft. There are brick piers at each end of the bridge, the approaches being fenced with cast iron standards and wrought iron rails. The plans were prepared by Mr. Henry Miller the county surveyor. The estimated cost of the entire work is £1050.

TONG.—Mr. Briggs Priestley, M.P., has formally opened the new Board School which has been erected at Highfield for the Tong School Board. The school has been built on the central hall principle. The number of places, the provision of which has been sanctioned by the Education Department, is 396, but if more are required these can easily be secured by erecting a separate building for cookery classes, and utilising the extra space in the main building, which would then be at disposal. The cost of the works, exclusive of the site, is about £7000. Messrs. W. and J. B. Bailey, of Bradford and Keighley, are the architects, and the following firms have been engaged on the works:—Messrs. Coates, Murgatroyd and Son, Idle, masons; Mr. Richard Raper, Dudley Hill, joiner; Messrs. Thomas Nelson and Son, Bradford, slaters; Messrs. J. Booth and Son, Dudley Hill, plumbers; Messrs. J. Laycock and Sons, Stanningley, plasterers; Mr. D. E. Hutton, Shipley, painter; the heating apparatus was provided by Messrs. J. Booth and Son and Mr. Thomas Mears, Bradford; the wrought iron work by Messrs. Taylor and Parsons, Bradford; and ventilators by Messrs. Cousland and Mackay, Glasgow.

Correspondence.

PARPOINTS.

DEAR SIR,—Permit me to call attention to two recent misapplications of the term "Parpoint" in your pages. The writers, no doubt, meant to imply coursed walling with rough face. What I believe to be a true parpoint is a wallstone the full width of a wall, such as is used for a dwarf wall faced both sides, or in walling above a roof at the gable end of a building. These parpoints are the most costly of their class of wallstones. The ordinary walling is faced with stones of 7in. average bed, and ranging from 7in. to 3in. in depth, the length varying considerably. The backing is either random rubble or brickwork. The face is classed as:

1. Clean-cut wallstones.
2. Clean-cut, slightly pitched.
3. Pitched face wall stones.
4. Insides.

"Clean-cuts" have a cracked face only, practically square to the bed. No. 2 are similar stones, having 4in. knocked off with a pitching tool around all edges of one face. No. 3 are stones which have not cracked squarely, and require portions of the face knocking off by hammer alone, or by the pitching tool.

The above are known as "Outsides," and stones unfit for the above classification as "Insides," which are used for inner walling, &c. The term "Shoddies" is applied by many to all untooled wallstones in courses, for what reason I have hitherto failed to get an explanation.—Yours truly, C. C.

Enquiry Department.

THE SKY-SCRAPER.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Could you, or any reader, give me the name and numbers of any paper that has had articles on American steel skeleton construction as applied to high building, and oblige, yours, etc., "SKELETON."

An illustrated article on this subject will shortly appear in these columns; but for more immediate reference perhaps some reader will supply the names of journals wherein the subject has been dealt with.

INTERNAL DAMPNES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Can you tell me (through the medium of your paper) what is the cause of dampness in internal walls of a house built six months ago? The house has been occupied about six months, and the dampness did not show itself until the recent wet weather; neither does it show itself in the partitions, and therefore cannot be attributed to the plaster or distemper. The walls are built with bricks made from clay obtained about ten miles from the sea. Would they attract sufficient moisture to cause the dampness? Thanking you in anticipation, I am, yours faithfully, J. F.

It is just possible that the moisture may be due to condensation. If so, the remedy is to be found in efficient ventilation, by means of an outlet near the ceiling level into the chimney. It is hardly likely that the bricks are to blame—at any rate, inspection of other buildings in which the same bricks have been used would soon show whether it were the case. The present distance of the brickfield from the sea hardly affects the matter, for clays quite free from salt are to be found close to the sea, and others strongly impregnated many miles inland.

THE Coronet Theatre at Notting Hill Gate will open on the 28th inst. The architect is Mr. W. G. R. Sprague, who also has in hand the Royal Duchess at Balham (to be completed early in the spring), and the Terriss Theatre, opposite the Town Hall at Rotherhithe.

Under Discussion.

EDINBURGH ARCHITECTURAL SOCIETY

Mr. John Kinross, A.R.S.A., Hon. President, delivered his address to the Society a few days ago. Mr. P. E. Nobbs presided. Mr. Kinross began by contrasting the munificence of such men as Usher, Findlay, and McEwan, in beautifying the city by the erection of public buildings, with the conduct of the landowning and speculative classes, who were everywhere, but specially in the suburbs, doing their best to sacrifice the amenity of our streets for their own gains. He insisted on wide streets with ample light being necessary for the health of the community, and spoke strongly in condemnation of timber fronts to shops and all flimsy and perishable types of Architecture generally. Mr Kinross in conclusion uttered a warning against the dangers of copying the features employed by great or popular architects, for many things were only allowable when treated consummately in the hands of a master. It was not the good work of great men that got copied, but the easily imitated and least worthy things they did.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

At the first meeting of the Session 1898-9, held at the Society's head quarters in Sackville Street, Piccadilly, W., Mr. C. H. Compton, V.P., in the chair, many objects of mediæval religious art were exhibited by Mr. Andrew Oliver, consisting of several crucifixes and one processional cross with reliquary; also four axes, and an ivory figure of St. Michael and the Dragon of Spanish workmanship, and a figure of our Lord with movable head of ivory. This also is Spanish of the sixteenth century, the hands and feet are lost, they were, doubtless, also of ivory. The most interesting exhibit was a hanging lamp of rough terra-cotta in the form of a fish of Early Christian date.—Mr. Patrick, hon. secretary, reported the discovery early last month at Paul's Wharf, Upper Thames Street, of a portion of an ancient wall 4ft. or 5ft. in height, composed of massive random built Kentish ragstone, resting on a grille of squared timber. The wall apparently had no squared face, it was found at a depth of 12ft. or 13ft. below the present ground line in excavating for new buildings under the superintendence of Messrs. Stock, Page, and Stock, who thoughtfully communicated the above particulars.—The Rev. H. J. D. Ostley, hon. secretary, reported further discoveries at Dumbarton, where the Crannog was recently found.—The Rev. Caesar Caine read a paper on "Our Cities sketched Five Hundred Years ago." The subject of the paper was a description of a most interesting fourteenth century transcript by an unknown scribe of Geoffrey, of Monmouth's History of the Britons, now in the British Museum and numbered Bib Reg. 13A. iii. A characteristic feature of this manuscript is the addition to the text of many drawings of persons and places. The scribe would seem to have travelled much, and to have been well acquainted with the places of importance on the road from London to Edinburgh, and has embellished the margins of the vellum pages, with sketches of the chief buildings. Thus we have the Tower of London, the Castle of Edinburgh, the walled border town of Carlisle and York Minster, all delineated with skill and clearly recognisable. The Abbey Churches of Bath, Gloucester, Winchester, with many others, and innumerable coats of arms and banners, add very great interest to this little old world volume. Mr. Patrick, hon. sec., exhibited on behalf of Mr. J. T. Irvine some very carefully measured drawings of the beautiful seventeenth century oak pulpit which, until recently, adorned the church of Yaxley, Hunts. Yaxley Church was visited by the Association during the recent congress, and many of the members were sorry to see the several parts of this fine piece of wood carving which was scarcely injured, thrown down and lying on the floor at the west end of the nave in order to give place to a brand new pulpit. The date of the pulpit is 1631.

Views and Reviews.

TIMBER MEASUREMENT.*

Two exceedingly valuable little books on the measurements of timber have just been produced by Mr. E. A. P. Burt, one being a guide to the cubing of round timber, and the other to the ascertaining of its weight for computing railway rates. They evidence an immense amount of most careful calculation and wise arrangement by an expert upon the subject, who has endeavoured and succeeded to supply to all who sell, purchase, or use timber, a ready and correct method of measurement. Plenty of examples are given, and everything is clearly explained.

* "Guide to Round-Timber Cubing Rule," by E. A. P. Burt. William Rider and Son, Ltd., Bartholomew Close, E.C. 2s. 6d. "Round Timber Measurement Tables for Railway Rates," by E. A. P. Burt. Rider and Son, 1s.

THE TESTING OF WATER AND SEWAGE.

Quantitative chemical analysis is a delicate operation, as a rule only to be undertaken by a properly qualified analytical chemist; yet analyses of water, and also of sewage effluent, are frequently needed, and must be made by the comparatively inexperienced. A simple method of doing this is admirably explained by Dr. Thresh, whose little book on the subject has now reached a second edition, many of the amateur's difficulties being overcome by the employment of chemicals in the form of soluble solids, securing absolute cleanliness combined with exactitude of measurement. As the metric system is used, to which chemists are accustomed, but not the general public, the fact must be noted—its advantage, where decimal analysis is needed, being obvious to all. A most useful feature of the book, too, is its inclusion of a series of specimen reports upon inspection and analyses, showing how they ought to be drawn up.

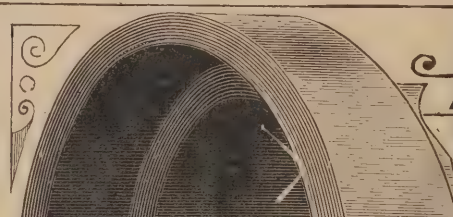

"A Simple Method of Water Analysis." By John C. Thresh, M.D., D.Sc., D.P.H. Second Edition, Enlarged. J. and A. Churchill, 7, Great Marlborough Street, S.W., 2s. 6d.

CARPENTRY AND JOINERY.*

This is a well printed little handbook of some 300 pages, dealing with the subjects of its title in the orthodox manner, as prescribed in the syllabus of the City and Guilds of London Institute, and perhaps, in consequence thereof, being mainly a replica, at least so far as the illustrations are concerned, of all those similar text books that have gone before, the compilers of which seem imbued with the idea that it is their whole duty to faithfully copy their predecessors both in truth and fault. Of this latter, the work now before us seems to possess fewer than most of those we have seen, but there are still one or two absurdities introduced, to wit, the utterly preposterous sheet of joints on page 73, copied, if memory serves us rightly, bodily from "Newlands," itself the work of a man who was perhaps everything but a joiner, but as his work is the bible of the Institute, Mr. Webber is doubtless wise in his selections. That he is a clever draughtsman, the neatness and appositeness of his diagrams testify, and the sharpness of the printing and general get up of the book are creditable alike to printer and publisher, but that it will fulfil the author's hope, as expressed in his preface, "that it shall become a work of reference for apprentices and craftsmen," we very much doubt. That it is an admirable text book for those enterprising youths who have a desire to pass the examinations and hold the certificates of the City and Guilds of London Institute, we can honestly affirm, as we can also of any other half-dozen of similar productions that have appeared annually since that body was inception; but—and this is a very important but—the requirements of this body, as exemplified in their examination papers, and the everyday practice of skilled carpenters and joiners, are two totally different things.

CONTRACTS OPEN.**TO BUILDERS and CONTRACTORS.**

Builders desirous of TENDERING for the GENERAL WORKS in the New Buildings for the Dundee Courier, about 900,000 cubic feet, are requested to communicate at once, by letter, with Messrs. NIVEN and WIGGLESWORTH, Architects, 34, Mecklenburgh-square, London, W.C., or 32, Bell-street, Dundee. 1

TO STEEL MERCHANTS and CONTRACTORS.

Contractors desirous of TENDERING for the STEEL FRAME CONSTRUCTION, about 650 tons, retaining Walls and Caisson Work of the New Buildings for the Dundee Courier, are requested to communicate at once, by letter, with Messrs. NIVEN and WIGGLESWORTH, Architects, 34, Mecklenburgh-square, London, W.C., or 32, Bell-street, Dundee. 1

TO BUILDERS.

The Guardians of the Poor of the Holborn Union desire to receive TENDERS for ALTERATIONS to the DRAINAGE SYSTEM at their Schools, Mitcham, Surrey.

Persons desiring to Tender may obtain a specification and form of Tender upon application any day between the hours of TEN a.m. and FOUR p.m. to the Guardians' Architect, Mr. A. SAXON SNELL, F.R.I.B.A., of 22, Southampton-buildings, Chancery-lane, W.C., and depositing with him a £5 Bank of England note, which will be returned to persons sending a bona-fide Tender in the manner and at the time and place specified below.

Tenders must be signed, sealed, and endorsed "Tender for Drainage Work, Mitcham Schools," and addressed and delivered to me at my Offices not later

than FOUR p.m. on WEDNESDAY, NOVEMBER 23rd, 1898.

The Guardians do not bind themselves to accept the lowest or any Tender.

By order,

H. O. HILL,
Guardians' Office, Clerk to the Guardians.
Clerkenwell-road, E.C.
November 8th, 1898.

HERTFORD UNION.

TO BUILDERS AND OTHERS.
The Guardians of the Poor of this Union invite TENDERS for the ERECTION of ADDITIONAL VAGRANT WARDS at the Union Workhouse, Hertford.

Drawings and specification may be seen at the Office of Mr. RUSSELL AUSTIN, 13, Villiers-street, Hertford, and form of Tender and quantities obtained from him on and after THURSDAY, NOVEMBER 17th, between the hours of TEN a.m. and SIX p.m.

Sealed Tenders, marked on the outside "Vagrant Cells," to be delivered to me, the undersigned, not later than NOVEMBER 25th, 1898. The Tenders will be opened at the meeting of the Board on NOVEMBER 26th, 1898, at ELEVEN a.m.

The Guardians do not bind themselves to accept the lowest or any Tender.

The person whose Tender is accepted will be required to enter into a contract, in writing, for the execution of the works.

By order of the Board,

T. J. SWORDER,
Union Offices, Clerk to the Guardians.
No. 24, Castle-street,
Hertford, Herts.

INTRODUCTION OF NON-FLAMMABLE WOOD INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to
Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"IOWA" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.

"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known
colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING,
(each of which is over eighteen stories high).

"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company
by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,
2, Army and Navy Mansions, Victoria Street, London, S.W.

Protective Metallic Coatings for Iron and Steel.*

By SHERARD COWPER-COLES,
Assoc. M. Inst. C.E., M.I.Mech.E., M.Inst.E.E.

(Continued from page cvii.)

WITH regard to the best working conditions of zinc sponge, most authorities recommend a current density of 18 to 20 amperes per square foot of cathode surface, and aqueous solutions of zinc sulphate acetate, or ammonium chloride, or tartrate, as being the most suitable for its deposition. Herman's process has also been experimented with on a commercial scale, the chief feature being the addition of the sulphates of the alkalies or alkali earths to a weak solution of zinc sulphate. Zinc deposits

obtained from hot electrolytes appear to be more porous than those obtained from cold electrolytes. When the articles to be zincd are first placed in the bath it is found advantageous to use as high a current density as possible, and after a few minutes to reduce it to about 15 amperes per square foot. Smee appears to have been one of the first—if not the first—to deposit cadmium. Since he published the result of his experiments the matter has received but little attention, partly due, no doubt, to the scarcity and

CONSIDERABLE COST OF THE METAL;

it can now, however, be obtained of good quality at a low rate. Its use has hitherto been confined to the production of the yellow sulphide, Cds., as an artist's pigment, and to the use of the photographer in the form of iodide, Cd₂I₂, and bromide, CdBr₂. Cadmium melts at the same temperature as tin; an alloy of 3 parts cadmium, 15 bismuth, 8 lead, 4 tin, fuses at the remarkable temperature of 140°

F., 72° below the boiling point of water, which has led to its being selected for the manufacture of fusible alloys for electric cut-outs. Cadmium resembles tin in colour and appearance and is very malleable and ductile at the ordinary temperature. Smee obtained good tough deposits of cadmium from an ammonia sulphate solution, made by adding ammonia to the sulphate and dissolving the precipitate in a very small excess of the precipitant, but was unable to obtain good deposits from sulphate or chloride solutions. In 1849, Messrs. Woolrich and Russell, of Birmingham, took out

A PATENT FOR DEPOSITING CADMIUM.

They prepared a solution by dissolving metallic cadmium in nitric acid of commerce, diluted with about six times its bulk of water, which they preferred to add at a temperature of some 80° or 100° F., adding the diluted acid by degrees until the cadmium was dissolved. To this solution of cadmium they added a solution of carbonate of soda (made by dissolving 1lb. of ordinary crystals in a gallon of water) until the cadmium was precipitated. The precipitate thus obtained was washed three or four times with tepid water when it was ready for use, various solvents being used, but the one preferred was a solution of cyanide of potassium, which was added in sufficient quantities to dissolve the precipitate and leave one-tenth of the solution in excess. The best working strength for the solution was found to be 6oz. (troy) of the metal to the gallon, the temperature of the bath being about 80° or 120° F. Bertrand claims to have obtained white adherent coatings from an acid sulphate solution, and a solution of the bromide slightly acidulated with sulphuric acid. A strong solution of the double salt of cyanide of cadmium and potassium will deposit the metal rapidly and in a bright form, a cadmium anode dissolving very freely.

ITS INERTIA TO CHEMICAL ACTION,

as compared to zinc and brass, renders cadmium suitable for coating the terminals and connections of primary and secondary batteries, and for coating small shot (for sporting purposes) and steel bullet jackets, in the one case to prevent the leading of the barrels, in the other the corrosion of the steel. Table No. 3 shows the weights and thicknesses of zinc coatings, and Table No. 4 the cost of various thicknesses of zinc and cadmium coatings. In coating iron and steel with copper the iron is first of all thoroughly cleansed either by pickling or sand blasting, and then coated with copper in an alkaline bath, the salt most commonly used being double salt of cyanide of potassium and cyanide of copper. As soon as a good coating of copper has been obtained in the alkaline bath, the article is then removed and placed in a copper sulphate bath. Hydraulic rams and gun barrels are coated to some extent with copper, but otherwise the process is not much used. Experiments have recently been made to apply copper sheathing to iron hulls direct by electrolysis, a portable vat being arranged to fit to the side of the vessel; but the process has not met with commercial success up to the present, owing to the excessive cost of the process, and on account of the copper being electro-negative to the iron or steel hull.

An examination of master and operative plumbers applying for registration under the National Registration of Plumbers was held on Saturday week by the Worshipful Company of Plumbers at King's College. Twenty-one candidates presented themselves for examination from various parts of London, also from Cambridge, Carmarthen, Guildford, Maidstone, Ramsgate, Windsor, and Worthing. The tests in workmanship included lead-bossing, pipe bending, and joint making, and the examination questions included the subjects of roof covering, contamination of drinking-water from faulty connections, arrangement of bath, sink, and closet wastes, drainage of town-houses, and disconnection with sewers. Nine succeeded in passing the examination in practical workmanship.

* A paper read before the Society of Engineers, on October 3rd, 1898.

THE CONSTRUCTION AND VENTILATION OF HOUSE DRAINS.

By PROF. A. BOSTOCK HILL, M.D., D.P.H.,
F.S.I.

IT might at first sight be thought that a subject like this in the present stage of sanitary science had been definitely settled, but, as a matter of fact, we find that on some points authorities still hold divergent views. The question of amount of fall, materials of pipes, &c., no doubt are agreed upon; but certain other points give rise to controversy on different forms of procedure in different districts. . . . The question of the relation of house drains to so-called compound drains and sewers has been forced on public attention by certain well-known decisions of the High Court; decisions given mainly to settle the point—what is a drain and what is a sewer? The subject is of importance, because sewers by Section 13 of the Public Health Act are vested in the local authority, while drains, of course, are the property of the private individual. In the past, at all events in the Midlands, it has been customary for

THE SMALL CONTRIBUTORY DRAINS

from a row of houses to join a larger one which connects with the public sewer. Most of the difficulties have arisen in cases of this kind. As regards the construction of these drains the size and methods of disconnection and ventilation are the chief points to be considered. As to size of drains, the smallest which will convey the necessary quantity of liquid is certainly best for reasons of cleanliness. From a single house a 4in. pipe is ample, yet I have been very surprised to find that in case of recently erected cottages a 6in. pipe has been insisted upon by some surveyors, and, as far as I can understand, the only reason urged for this is the less likelihood of the pipe becoming blocked. But, even if this be true, which I take leave to doubt, there are many corresponding disadvantages. From small houses the soiled water chiefly comes down in gushes, the pipe itself, if it be as much as 6in., is never nearly filled, but the sides get splashed, and they are in a very short time dirty, and have on their surfaces matter in a state of putrefaction. Again, it is impossible to flush a pipe as large as 6in. coming from a single small house, so that, although such a pipe may not become so frequently stopped up, still it is in a condition in which sanitary science has conclusively proved a house drain should not be. It is, however, on

THE QUESTIONS OF DISCONNECTION AND VENTILATION

that the greatest differences occur. The by-laws in many towns state that every drain shall be cut off by an intercepting trap from the sewer. The judges have decided that a so-called compound drain on private property is a sewer, therefore, say certain authorities, we must insist on the presence of an intercepting trap between each of the contributory drains, and the common drain which has become a sewer. Let us suppose, for the sake of argument, that legally a compound drain, though on private ground, is a sewer. As the by-laws were formulated some years previous to the legal decision, we may take it as at least doubtful whether the compound drain was intended by the sanitary advisers of those who framed the by-laws to be so considered; and we may also consider whether though legally a sewer it is desirable, from a sanitary point of view, to treat it as such, as regards our methods of interception and ventilation. Let us consider this for a few moments.

THE OBJECT OF A DRAIN

is to remove, as quickly as possible, from the neighbourhood of the dwelling, foul water which has passed into it. The law here steps in, and those who choose to consider it binding insist that at each junction of the sub-drain with the compound drain (legally a sewer) there shall be a disconnecting trap between the house drain and the compound drain, so

that in a row of six houses we shall have six intercepting traps between the various sub-drains and the compound drain. Each of these traps holds a considerable quantity of liquid and solid matter, and, as a trap is an obstruction to the regular flow of the liquid passing through the drain, each of these syphons becomes for the time being a small depositing tank where solids in suspension precipitate themselves. The compound drain is treated in one of two ways: either it is made to discharge

INTO THE STREET SEWER

without an intercepting trap at all, and connected with a ventilating shaft running up to the roof of one or more houses, or else an intercepting trap is put just where it enters the road, an air inlet as in the case of the other traps being provided, and a ventilating shaft being taken from it at or near its highest point. In the latter case we ventilate only that part of the sewer which is on private property. In the former case we utilize private property for the ventilation to some extent at least of the public sewer. Under this system, which I regret to say is becoming common in many instances in the Midlands in new property, the following must of necessity occur. Each of the syphons on the branch drain holds foul water; in the case of the house having a water-closet, which is the rule at the present time, the trap holds faecal matter as well. The inlet which is on the drain just on the house side of the interception trap, and which, when no water is coming down, may act as such, becomes an outlet every time a flush of water is sent down, and the fouled air, which the length of house drain contained coupled with the gas which has been given off by the fouled matters in the trap, is discharged into the air in close proximity (in some instances not more than 6ft. or 7ft.) to the back doors of the houses. Closely connected with this question is that of the

VENTILATION OF DRAINS AND SEWERS.

I have been somewhat surprised to find that many surveyors at the present time are recommending the ventilation of sewers up houses on private ground. Such a proceeding is—and as I believe, I have shown on other occasions—attended with considerable danger to health; and I wish to enter here a protest against a method which I believe to be utterly wrong in principle, and which tends to distract public attention from the real source of the nuisance, and which palliates an evil instead of removing it. It is common knowledge that nearly all newly-laid sewers on the separate system, if they be ventilated by ventilators at the crown of the road, are, when first put into operation, a nuisance to the public. It is equally well known, I believe, that the cause of this nuisance is the stagnation of sewage, the deposition of solids in some portion of the sewer, consequent putrefaction, and the production of offensive gases, so that when a sewer gives offence to the nose it is a sign that it is not doing what it was intended to do, viz., carry fresh sewage, which in itself is always inoffensive. When this state of things occurs the public demands that the nuisance be abated. Owing to the very large number of schemes which have been completed of late in the smaller towns and rural districts these complaints have become quite common, and there has been a tendency, which I consider to be unscientific, to endeavour to remove the nuisance from the nose, instead of removing the cause which produces it. I wish finally to take this opportunity of entering my protest against some of the systems which are officially being carried out, and notably that which instead of preventing the formation of noxious gases tends to bottle them up, and discharges them some few feet above the roofs of private houses. . . .

THE new Infectious Diseases Hospitals, which have been built for Leeds at Manston, near Crossgates, were recently formally opened.

THE Mersey Docks and Harbour Board has accepted the tender—amounting to £250,000—of Mr. C. J. Wills, Manchester, for the construction of a new dock, &c., in connection with Queen's Dock.

Builders' Notes.

At a time when ironmasters look more than ever for their profit from the recovery of residual products, some facts gleaned from an official German report may be interesting, as they show the worth of furnace slag when converted into building bricks. The slag in this new process is first broken and then passed through water, which causes disintegration, the silica being separated in a soluble condition, and, as such, hardens in the air and combines readily with caustic lime. The slag grains are next compressed with the silica, and by the addition of a small quantity of burned or slacked lime—ten per cent.—the subsequent hardening is facilitated. Six to eight days in such case is sufficient.

THE famous regatta town of Henley-on-Thames is destined to important developments in the near future. The extensive property known as the Bolney Estate stretches from Henley to Shiplake and Harpsden, with an area of upwards of 1700 acres, and, including the residences of Bolney Court and Harpsden Court, has been sold to a London syndicate by Messrs. Simmons and Sons for £50,000. This transaction is likely to have a great effect upon the development of building property in the neighbourhood of Henley, all the land on the north side of the town being practically locked up. The Bolney Estate possesses a frontage to the Thames extending from Marsh Lock to beyond Shiplake Station, the Reading and Henley Road intersecting the estate, which is well timbered.

WORK at the Jamaica Bridge, Glasgow, continues. The heavy part of the work may be said to have been finished four weeks ago, when the last block of these even arches was placed. The arches are solidly built into five piers and two abutments of great strength and solidity. With each of these resting upon steel caissons 15ft. in diameter, and filled with concrete, there is every confidence assured in the stability of the new bridge, which will no doubt form the main connection between the north and south parts of the city for another century anyhow.

FOR the past fortnight or so, since the spandrels were filled up, workmen have been engaged laying new cast-iron pipes in the iron troughs which are embedded on both sides of the bridge. These pipes are 27in. in diameter, as compared with the 13in. pipes now run underneath the service bridge. There are also being laid out in parallel troughs 24in. gas pipes, which will give an adequate lighting service to the southern suburbs and Paisley Road district for many years. That the bridge will itself be brightly lighted at night seems certain from the elaborate electric installation now being introduced, and handsome pillars and pendants will enhance the parapets. While the bridge will be a little more ornamental than the old one, it will be much easier kept clean, as most of the granite above the level of the pavement will be polished. Sections of the base and coping, which were sent to Aberdeen to be polished, have been returned with the appearance of the material greatly improved. The rough-dressed ballisters will all be treated in the same way. The bridge, which is 80ft. wide, or 20ft. more than its predecessor, will look extremely handsome and showy under the rays of the electric light, besides affording greater freedom to pedestrians and no cause for congestion of vehicular traffic. It is a little over three years since a start was made with the demolition of the old structure, and considering the variety of difficulties met with under water, the contractors do not consider too much time has been occupied in rebuilding. It is satisfactory, anyhow, that not the slightest shrinkage occurred when the casings or supports were withdrawn from any of the arches. Not unfrequently this does happen in bridge building.

PARIS ABATTOIRS.

By R. STEPHEN AYLING, A.R.I.B.A.

THE ABATTOIRS OF "LA RIVE GAUCHE."

At the time of the erection of the Abattoirs of La Villette it was anticipated that they would be of sufficient size to supply the wants of the whole of Paris, but experience proved this to be untrue, and thus the small existing abattoirs of the Left Bank have still been retained.

They are in many respects faulty in arrangement, and in 1887 the Municipal Council voted the erection of a new abattoir to supersede them. In the same year the site was selected, and M. Ernest Moreau, honorary architect to the City of Paris, was appointed to prepare designs, which were approved, and the work was commenced in 1893. It has been ascertained that the total consumption for the whole of Paris amounts annually to about 349,000 beasts, 226,000 calves, 1,751,000 sheep and 226,000 pigs, and as the population of the Left Bank amounts to one-quarter of the total population, it was decided to erect these

FIG. 29.

échaudoirs round the great entrance court, rendering access easy, and affording facilities for carting the dead meat; (2) by placing

only one échaudoir on the side of the slaughter court, which is proportionately nearly double the size of those at La Villette; and (3) by arranging the bouvieries and bergeries in direct communication with the slaughter courts, so that the animals have only to cross the waiting court to arrive at the place of slaughter.

This latter is an admirable arrangement, as each animal is brought in separately, and does not see other animals killed.

ABATTOIR FOR BEASTS, SHEEP, AND CALVES.

The entrance for this portion is from the Rue des Morillons, and consists of six large gates, with smaller gates for foot passengers. The piers are in masonry, surmounted by sculptured oxen.

On either side of the entrance are two buildings, AA, devoted to offices of the Octroi, offices of the Butchers' Trade Committee, caretakers' apartments and residences. They are built in brick and stone and are two stories in height. Weighing tables are provided on the sides near the gates for use as the carcasses leave the échaudoirs. Placed centrally with the entrance gates is the Pavilion, B, which contains offices for the collection of municipal taxes, sanitary and veterinary inspectors' offices, police station, and ambulance corps (Fig. 29). Beyond these buildings to the right and left is the large entrance court with the fountain (Fig. 30) in the centre, and on either side a parterre planted with trees, with roads for carts leaving the échaudoirs. Round

FIG. 30.

buildings of sufficient size to enable that proportion of work to be carried out. They are thus arranged for the slaughtering of 87,250 beasts, 56,550 calves, 437,890 sheep, and 63,995 pigs annually, and space has been left for future extension if found necessary.

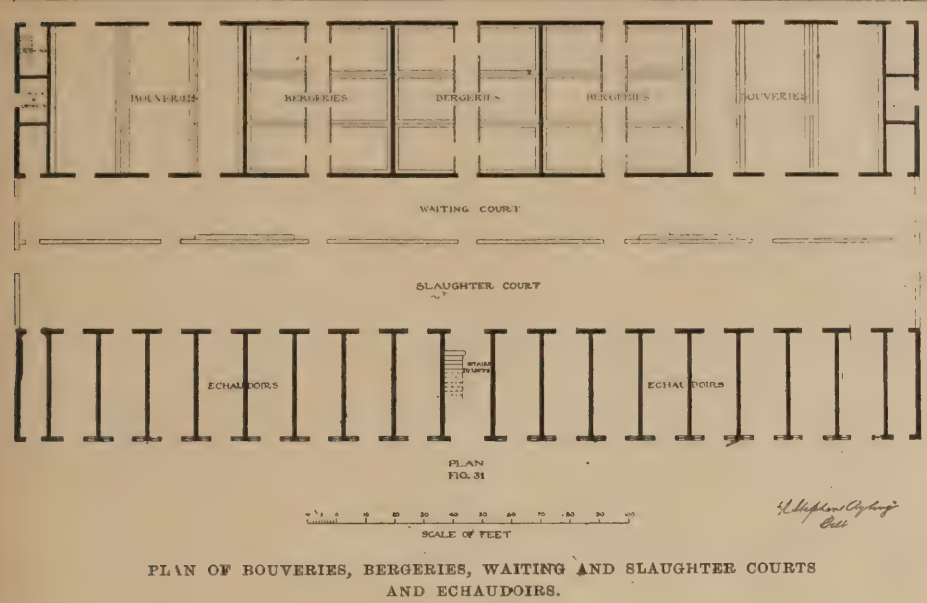

The new abattoirs are situated in the sixteenth arrondissement, and are surrounded by the Rue de Dantzig, Rue des Morillons, Rue Brancion and the Chemin de fer de Ceinture. The buildings are not yet quite completed, the abattoir for horses being at present not started.

The site covers an area of twenty-five acres, and is divided into three portions, viz.: (1) the part devoted to the killing of beasts, calves and sheep; (2) for pigs; (3) for horses, and each of these parts is distinct in itself, with separate entrances. As at La Villette, the railway adjoins the site, and it is by this means that the animals are brought to the abattoirs.

M. Moreau has endeavoured, and very successfully, to avoid some of the serious defects in planning which exist at La Villette, (1) on account of the immense area occupied by the échaudoirs, some are necessarily a long way from the entrance: (2) the échaudoirs are placed on each side of the slaughter courts, which are too narrow for the purpose; (3) the bouvieries and bergeries are in isolated buildings, separated by streets, thus the animals have to be driven for a considerable distance before they reach the slaughter courts. It will be noticed on the plan (Fig. 28) that these defects have been avoided (1) by grouping the

FIG. 33.

this courtyard are four large buildings each containing cattle stables, waiting courts, killing courts, and échaudoirs.

Fig. 31 is a plan of one block, the others being exactly similar. In the centre of one side are placed the bergeries (sheep stables), E, divided into eighteen pens and with feeding troughs round the sides. The divisions are formed of iron framing, the lower part being filled in with half brickwork cemented, and the upper part with iron railings (Fig. 32.) On either side of the bergeries are the bouveries (stables for oxen), F. These are separated from each other by dwarf walls, which are cemented. Iron hooks and rings are fixed in the walls, to which the animals are tethered. At the opposite side of the block are the échaudoirs (scalding and cutting up rooms), G, eighteen in number, and in the centre a staircase giving access to the loft over, which is used as a forage and litter store.

Between the stables and échaudoirs are two courts, H and I, one 21ft. wide, in which the animals wait before being killed, and the other, 29ft. wide, used as the slaughter court. These courts are separated by a dwarf wall 8ft. high, which has seven doors in its length. The animals are brought from the waiting court to the adjoining killing court separately, and it is in this particular that the system is so very greatly superior to that at La Villette. In the latter, the animals have to traverse streets in their journey from the stables to the slaughter courts, which, in addition to danger from refractory animals, necessitates them being brought in numbers and having to stand near whilst their companions are killed. As will be seen, the slaughter courts are 29ft. wide, and work is only done on one side, whilst

THE ABATTOIRS OF LA RIVE GAUCHE, PARIS.
BLOCK PLAN.

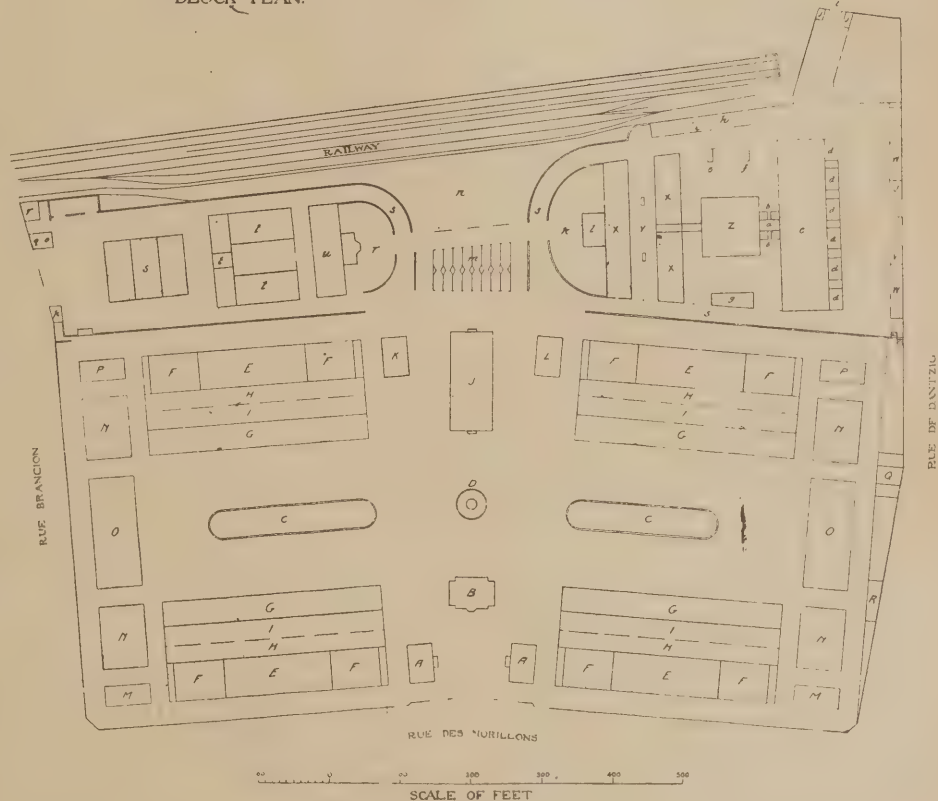

Fig. 28.

at La Villette, the courts are but 33ft. wide, and killing is carried on at both sides.

Effort has been made to give to each of the four blocks of butcheries equal importance, a large surface for circulation and cartage, and also to so place them that they are all in view and easily accessible.

Should any of the animals run away, they can only do so in the waiting court, and so a grave source of danger is avoided.

Sanitary conveniences, and stairs for access to the lofts over the stables, are provided at the ends of the building adjoining the bouveries.

The two courts are spanned by one iron and glass roof as at La Villette. Fig. 33 shows a killing court, with échaudoirs on one side, and the dwarf wall separating the courts on the other. Figs. 29 and 30 show exterior views of these buildings, which are executed in brick and stone, with red tile roofs. The whole of the floors of the stables, échaudoirs and courts are in cement.

(To be continued.)

MR. ROBERT VIGERS, president of the Surveyors' Institution, sat as arbitrator in the case of "Milledge v. the School Board for London," a claim for compensation in respect of the freehold in four houses at Tollington Park, Holloway, known as Nos. 31, 35, 41, and 43, Marriott Road. It appeared that the four houses in question were each

Property and Land Sales.

Plasht Hall Estate.—Fifteenth Sale of Freehold Building Land, close to the Romford-road.

MESSRS. TUCKETT and SON are instructed by the Trustees of the late John Gurney, Esq., to **SELL by AUCTION**, at the Princess Alice, Forest-gate, on **THURSDAY EVENING, NOVEMBER 24th**, at **SIX o'clock**, 20 very prominent **SHOP PLOTS**, in the best part of White Post-lane, and 64 Plots for private houses, having 16ft. frontages to the extension of Halley-road. Immediate possession. Free conveyances. Deferred payment. Interest 4 per cent.

Particulars of Messrs. YOUNG, JONES, and Co., Solicitors, 2, St. Mildred's-court, E.C.; or of Messrs. TUCKETT and SON, Land Agents, Surveyors, &c., 2, Basinghall-street, E.C.

FAIRMILE PARK, near Cobham, Surrey.—A **FREEHOLD BUILDING ESTATE** of about 40 acres, with possession.

MESSRS. DRIVER and CO. have received instructions to offer to **AUCTION** at the MART, Tokenhouse-yard, Lothbury, **NEXT SPRING** (unless previously sold by private contract), the above property, situate in a favourite residential district, about a quarter of an hour's walk from the Oxshott and Fairmile Station, and about a mile and a half from Cobham Station. The estate comprises Building Land, ripe for development, the higher portion (sloping to the south) possessing charming views over the intervening country to Epsom Downs; and a Residence known as "South Lodge," with stabling and garden; Eight small Villas, some Cottages, and the "Griffin" Beerhouse. On a portion of the estate brickearth is being worked, and will be included in the sale as a "going concern."

Particulars and plans, when ready, can be obtained of **CHARLES JEFF**, Esq., Solicitor, 48, Lime-street, E.C.; and of Messrs. DRIVER and Co., 23, Pall Mall, S.W.

SURREY.—Choice BUILDING ESTATE.

—In a charming district, two miles from Horley station (L.B. and S.C. Rly.) under one hour from London and adjoining a village where are church, shops, and post-office; two miles from Roman Catholic Church.

FOR SALE, a compact and valuable **FREEHOLD PROPERTY** of 53 acres, with a frontage to the main Brighton road of 2000ft., and perfectly ripe for development, with residences of a good class. Prettily timbered. Gas and water mains along the frontage. Would be divided.

Plans and full particulars of the owner's agents, Messrs. GREEN and SMES, Auctioneers and Estate Agents, Blenheim Mansions, Queen Anne's-gate, London, S.W., or Mr. W. M. LEACH, Auctioneer and Estate Agent, Crawley, Sussex.

CANNING TOWN, within five minutes' walk of Custom House Station.—A small Freehold Building Estate, comprising a little over six acres, ripe for immediate development.—With possession.

MESSRS. VENTOM, BULL, and COOPER are instructed to **SELL by AUCTION**, at the Mart, Tokenhouse-yard, on **TUESDAY, NOVEMBER 29th**, 1898, at **TWO o'clock** precisely, about **SIX ACRES** of valuable **FREEHOLD BUILDING LAND**, comprising the only uncovered land lying between Canning Town Station and the Recreation Ground, and possessing important frontages to the Freemasons and Prince Regent roads; tithe and land tax free.

Particulars may be had of Messrs. HERBERT SAXELBY and Co., Solicitors, 7 and 8, Ironmonger-lane; at the Mart; and of the AUCTIONEERS, 35, Old Jewry, E.C.

By **EDWIN FOX and BOUSFIELD**,
At the AUCTION MART,

On **WEDNESDAY, NOVEMBER 16th**, at **TWO**.
By Order of the Trustees of the late Edward Dewick, Esq., and another.

CITY of LONDON.—Walbrook.—FREEHOLD ESTATE, comprising No. 31, Walbrook, and No. 1, Bond-court, covering superficial area of 1790ft., well lighted and possessing the conspicuous frontage on the upper stories of about 38ft., with a depth of 53ft., thus affording scope for the erection of a handsome modern building for commercial or professional purposes. The site is at present covered with the very substantial five-story premises, for many years occupied by Messrs. Herring, Dewick, and Hardy, wholesale stationers, and is thoroughly sound, each floor carrying heavy weights. Possession on completion of the purchase. The property is thus available for occupation in its present form, for investment by re-letting, or for more profitable utilisation by creating a ground rent on building lease, or devoting capital to the erection of such a noble pile as will ensure a large return.

Particulars at the Mart; at Messrs. EDWIN FOX and BOUSFIELD's Office, 99, Gresham-street, Bank, E.C.; and of the Vendor's Solicitors, Messrs.

VANDERCOM, HARDY, and DOULTON,
23, Bush-lane, E.C.

Strawberry-hill, Middlesex. Within eight minutes' walk of the Station on the L. and S.W. Railway.

MESSRS. TOPLIS and HARDING will **SELL by AUCTION**, at the MART, E.C., on **FRIDAY, NOVEMBER 11th**, at **TWO o'clock** punctually:—

The valuable **FREEHOLD PROPERTY** known as Nos. 5 and 6, Waldegrave-terrace, Strawberry-hill, Middlesex, producing rentals, actual and estimated, amounting to £60 per annum, together with a plot of **FREEHOLD BUILDING LAND** adjoining, ripe for development, and having a frontage to Waldegrave-terrace of about 55ft., a depth of about 154ft., and an area of about one-third of an acre.

Particulars, plans, and conditions of sale may be had at the Mart, E.C.; of F. G. MELLOWS, Esq., Solicitor, 9, Fenchurch-buildings, E.C.; and of Messrs. TOPLIS and HARDING, 66, Cannon-street, E.C.

ASSOCIATION OF DESIGNERS.

DESIGNS, WORKING DRAWINGS, PERSPECTIVES, ARCHITECTS, DECORATORS, & BUILDERS ASSISTED. INTERNAL DECORATIONS EXECUTED IN ALL STYLES.

ITALIAN. FLEMISH. GEORGIAN. FRENCH. ENGLISH. ADAMS.

Offices: 20, JOHN STREET, ADELPHI, W.C.

Sales of Estates, Hous Property, Ground Rents, &c.

MESSRS. PROTHEROE and MORRIS beg to announce that their **SALES** of the above take place at the MART, London, E.C., the **LAST WEDNESDAY** in **EVERY MONTH** and on other days as required. Special attention given to the Sale of Estates in Plots.

Estate Offices, 67 and 68, Cheapside, E.C., and at Leytonstone.

R. I. B. A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Mr. W. CHURCH HOWGATE, A.R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum).

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

R. I. B. A. SOCIETY OF ARCHITECTS, and **CIVIL SERVICE TECHNICAL EXAMINATIONS**. Preparation by correspondence, in residence, or personally.—MIDDLETON and CARDEN, 19, Craven-street, Strand, W.C.

PLANS, SPECIFICATIONS, QUANTITIES, &c., carefully prepared by young Architect. Moderate terms to those about to build.—ARTISTIC, 1, West-terrace, Whitbv. 6

QUANTITIES, Estimates, Measurement and Adjustment of Variations, Preparation of Accounts, and kindred work at strictly moderate charges by experienced man. Special terms Architects' work.—"Survey," 23, Kilburn Priory, Kilburn. 2

AGENCIES.—The great demand and enormous field for the conversion of existing windows into "N.A.P." windows render necessary the establishment of agencies in all important towns. Builders, Decorators, &c., desirous of securing AGENCIES are therefore invited to communicate with the SECRETARY, "N.A.P." Window Company Limited, 159, Victoria-street, Westminster. 1

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

WANTED, first-class ARCHITECTURAL ASSISTANT, able to prepare working drawings from sketches, take off quantities, and prepare details. One who has had some experience in surveying and levelling preferred.—Apply, stating age, experience, and salary required, to Box 888, BUILDERS' JOURNAL. 2

JUNIOR ARCHITECTURAL DRAFTSMAN WANTED for estate and county surveyor's office.—Apply, with references and salary, to "LAND," Office of this paper. 1

TRACING and TYPE-WRITING.—VACANCIES for pupils in well-established Office. Gentlemen only.—Box 853, BUILDERS' JOURNAL Office. 1

WANTED, in a Country Office, an ASSISTANT, able to finish drawings artistically; must have knowledge of quantities; state salary, age, and experience.—Box No. 333, Office of BUILDERS' JOURNAL. 1

WANTED, a thoroughly qualified ARCHITECT'S ASSISTANT. Must be able to help with quantities. Salary not exceeding £3 3s.—Reply, stating experience, forwarding specimens of work, to ARCHITECT, 102, Westborough, Scarborough. 1

CLEETHORPES - WITH - THRUNSCOE URBAN DISTRICT COUNCIL.

The undersigned has a Vacancy for a PUPIL, premium required.

Splendid opening for a pushing youth at this popular watering place. Population in 1891 was 4306; population at present time, over 13,000.

Further particulars on application from **EGBERT RUSHTON, C.E.** (by exam.), Engineer, Surveyor, and Inspector. 1

Cleethorpes.

ARCHITECT and SURVEYOR'S ASSISTANT.—WANTED at once, good draughtsman, able to level and make small surveys. Knowledge of specifications required.—Apply, in first instance, by letter only, enclosing references and stating salary required, to Messrs. POWELL and Co., St. Swithun's Estate Offices, Lewes.

ARCHITECTURAL DRAUGHTSMAN WANTED in North of England with view to permanency.—State age, salary, experience, references, to D., 32, care of C. Birchall, Liverpool.

BUILDER'S CLERK WANTED. Must be able to take out quantities, and have had experience in preparing accounts of extra works and variations. Also able to trace drawings.—Address, stating age and salary, with copy of testimonials, to Messrs. E. PRICE and SONS, Builders, Coleham, Shrewsbury.

APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

YOUNG ARCHITECT, A.R.I.B.A., DESIRES to ASSIST others in the PREPARATION of DRAWINGS at his own office. **G. SCOREE**, 23, Newman-street, W.

PERSPECTIVES.

E. BECKITT LAMB,
31, Craven-street, Charing Cross, W.C.

ANSELL and MALLOWS, Architectural Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C. 1

QUANTITY SURVEYOR, experienced, PREPARES Bills of Quantities, Estimates, Measured Work, &c., at own office in Strand. Work carried out without delay. Special terms.—Box, No. 891, Office of the BUILDERS' JOURNAL. 1

ARCHITECT'S JUNIOR ASSISTANT (23) desires RE-ENGAGEMENT. Four years' experience in high-class work. Good references. Student R.I.B.A.—Apply, "A.", 23, Otley-road, Harrogate. 1

WORKING FOREMAN of PAINTERS seeks RE-ENGAGEMENT; large London experience; good colourist and manager of men; town or country; good personal references; wages moderate.—"W. F.", 14, Ravensdon-street, Kennington Park. 1

BUILDER'S CLERK and GENERAL ASSISTANT requires SITUATION. Thorough practical knowledge of the trade, keeping and pricing accounts. Good references.—Apply J. MASON, Daniel's Farm, Sandow, Herts. 1

ARCHITECT and SURVEYOR'S JUNIOR ASSISTANT DISENGAGED. Levelling, surveying, good draughtsman, inking-in, colouring and tracing plans, &c. Usual office work. Good testimonials. Moderate salary.—J. S. RAMSHAY, Oundle, Northants.

ARCHITECT'S JUNIOR ASSISTANT (20) seeks RE-ENGAGEMENT. Neat and quick tracer. Shorthand (60). General office routine. Six years' experience.—H. WITT, care of Messrs. Gibson and Russell, 11, Gray's-inn-square, W.C.

ASSISTANT (Architect's) Disengaged. Used to infirmaries, hospitals, hotels, and domestic work. Practical and artistic draughtsman.—"Art," 4, Butler-street, Preston, Lancs.

ARCHITECT'S ASSISTANT (junior) seeks APPOINTMENT. Good references. Neat draughtsman, working and detail drawings, specifications, surveys. First-class certificates in freehand, perspective, and advanced building construction.—DENNER, care of Warren, Architect, Exeter.

Criticism: Its Application to Regenerative Art.

"In order to define what is fairest, you must delight in what is fair."

So wrote Ruskin in his early years, in his first work upon "Modern Painters." With that advanced enlightenment, which was the sure sign of his genius, he saw the true dominating spirit of creative Art, and placed his discerning finger upon it. It is one of those truths which are remarked by many as being unquestionable. "Why," we can hear them say, "it is apparent, and what I myself could have written," but this is a fallacy on their part. The real impressive truths have always this striking correctness, to which fact we doubtless owe the feeling of a long acquaintance. Yet the intellectual and critical background necessary for the culture of such clearness of vision is incalculable. It requires a mind, great indeed, to break through this illusive satisfaction, searching until it finds, and dragging into the broad light of day the knowledge which it has gathered so painfully in the dark. Yet considering this artistic confession of faith by the cold glare of to-day, its truthfulness is still impressed upon us with resistless force, even while we wonder at the serene abandon which permits of such a confession. It seems to urge us with agonising earnestness to cast aside the stereotyped forms and old threadbare fallacies which are still, to a certain extent, clogging our progress, like weeds the young growth of the wheat. Go to the woods! Violate the secrecy of untrodden glades! Seek out the solitude of leaves and singing brooks, mark the clear profile of mountain ranges, the changing shadows chasing each other over the green slopes, and the fleecy masses of cloud overhead. All this it cries on regenerative Art to accomplish, and then having partaken to the full of the inimitable beauty, create, build, make, a lasting memorial of the fairness of things everywhere around you. The thought is in strange uniformity with that of the gospel of criticism given with such excellence of expression by Matthew Arnold. These two men, so widely different in temperament and the expression of their faith, have striven both in one direction. Matthew Arnold pointed out that degenerative periods of literature were largely due to the disuse of the critical faculty. Critical effort was choked, pushed out of sight, by a great burst of creative power; so much so, that it disappeared for a

time, almost completely, from the field of literature. Yet of this independent burst of creative effort little survives, to bear without blame, the final judgment of time. Ruskin, when he calls on us to go to the fields and paths of pure excellence, is urging indirectly for the exercise of the critical side of Art. "Whatever is in Architecture fair or beautiful," he says, "is imitated from natural forms;" and it is to the critical faculty that natural forms are made to give reasons of their beauty. For to make use of natural beauty we must analyse its charm, divesting it of its halo of mystery, and drawing its secret from it to ourselves, whence we can utilise it to the glorification of Art in all its branches. Who is more analytical and critical than Ruskin himself in his apprecia-

tion of writing Ruskin doubtless owed to his critical faculty exercised in this, as in other branches of Art. The mature style of Robert Louis Stevenson, which has gained for itself an almost universal admiration, was not formed without infinite trouble, and that necessary critical appreciation of the great stylists in literature. The artist cannot express himself alone, unaided by the work of previous exponents of his Art. He must study continually, he must search with this critical faculty of which we speak for the wandering beauty, the indefinite charm, in all around him. A satisfactory application of the artistic gift can only be obtained by an intense and wide knowledge, conversant with the beauty of past and current forms. Once this is recognised and observed in its entirety, there would follow a rejuvenated outburst which could easily put

Vide ARTS AND CRAFTS AND THEIR RELATION TO ARCHITECTURE.

tion of Architecture in "The Stones of Venice?" He inquires closely into every form of beauty, every felicity of proportion; while his analysis of decoration is such as to give us, if we are in sympathy with him, a complete grasp of the great necessary principle of the application of ornament. Here we have the ideal treatment of the subject, for no one can deny that this great book is not in every way an appreciation of Venetian Art. Yet it reserves to itself the right to qualify its praise with severity of judgment, and to temper mere admiration with critical thought. It is apart from the subject, though we will mention it, that Ruskin in his appreciation of, and lofty ambition for Art, has obtained an excellence, a serenity of expression in his writing, which even Matthew Arnold could not better. The opening words of this book have become a jewel of literature for all time. It is a poem written in prose, where beauty of expression, purity of thought, and charm of manner meet to make an excellent whole which has been unsurpassed in this century. This per-

to shame our present artistic output. Yet in this we do not think of the Art of to-day as poor or ineffectual, however unambitious it may be. Ruskin gives us guidance again when he says, "We may not be able to command good, beautiful, or inventive Architecture, but we can obtain an honest Architecture;" and in this we have our own case. Whatever has been accomplished by the Art of to-day, whether it is inferior or second-rate, there can be no doubt of its honesty. The hall-mark of the time is at least honesty of purpose and genuineness of aim. This being so, we cannot despair of its future, for where there is honesty there is truth, and from the pinnacle of truth the climb is straight to the completion of beauty. With all the hope that can be drawn from Ruskin, there is also a warning, which, we think, would not be out of place to end with, "The aspect of the years that approach us is as solemn as it is full of mystery; and the weight of evil against which we have to contend is like the letting out of water."

F. B.

ON REFLECTION.

London's Proposed Hotel de Ville.

WE are glad to notice that the project for adequate accommodation of the London County Council's executive under one roof, is again approaching consideration. The excellent work done by the L.C.C. since its inauguration, and the far-reaching power it exercises in promoting the welfare and prestige of London, entitles it to the distinction of an imposing site, and monumental design, for its official home. Apart from these reasons, the needs of economy, and a thorough efficiency in its administration, demands a new scheme of accommodation. Eighteen months ago it was shown that there was immediate want of extra accommodation for 500 clerks and other public and executive chambers incidental to the work of the Council, and these needs have considerably increased since then. It may be considered to have been due to want of tact, and a lack of careful exactness in the statements of the Council, which last year brought about the rejection of the "London County Buildings Bill" by the House of Commons, with a majority of eighty-one on the vote. It was shown that the Council's project, for the fulfilment of which a sum of £1,000,000 was asked, could not be realised for less than £2,000,000, and this tended to promote a disbelief in the Council's sincerity and good faith. It was further stated that the Cockspur Street-Trafalgar Square site was the most expensive available in all London. We hope that when the Council presents its next Buildings Bill it will get what it wants.

The Westminster Cathedral.

FEW people who pass along Victoria Street have probably remarked the growth of the new Roman Catholic Cathedral in Astley Place. This huge building is now advanced far enough to allow of some idea being formed of the scope and intention of the design, for the clerestory is now generally complete, and much of the exterior scaffolding is now removed. It is premature to say much of a building which is still so far from being completed, but the precision and power of the designer, as well as the daring originality of his style must be admitted by all. It is little to prophesy that Westminster Cathedral in ability, as in size and importance, will be Mr. Bentley's masterpiece; and we dare further to prophesy that it will take rank in history as one of the foremost buildings of the century. It exhibits the architect's remarkable mastery of the difficulties of scale and proportion in the detail, in marked degree, and is full of thought and of subtleties in arrangement and uses of material. The style is an anomaly, but exhibits little that is incongruous. It is best described as "Byzantine," and we learn that Mr. Bentley spent three months in Constantinople and adjoining districts before maturing his design. The campanile is not to be built at present, and it is to be hoped that Mr. Bentley will modify it. The cathedral is so closely surrounded by lofty buildings that it would be impossible to raise a tower to a height which would enable it to be seen from the adjoining streets; and, for the purpose of identifying the church from a distance, a much lower tower would meet all ends.

Mr. Wilson on Arts and Crafts.

WE publish today the concluding portion of Mr. H. Wilson's essay, which was read as a paper before the Architectural Association on the 11th inst. Apart from the great literary gifts and abilities of the author, this essay deserves a wide attention for the erudite

epitome it renders of the origin and functions of handicraft, and the Arts and Crafts guilds of early times; and also for the many valuable instances and illustrations which are here collected and presented in establishing Mr. Wilson's assertion, that so far from Architecture being the "Mother of the Arts," as the catch-phrase has it, the very existence of Architecture must be referred to the activity and importance of the various handicrafts from time immemorial, and, more directly, to the collective enthusiasm and enterprise of the so-called guilds. In the middle ages the life and aspirations of the guilds was the life and aspirations of the cities and the nation. The whole municipal, industrial, and social life moved in the circle of the guilds. The guilds were the disseminators of culture, they were the centre of intellectual activity, they were the great religious force, they were the medium through which the ideals, the learning, and the shifts and contrivances of foreign civilisation were absorbed and assimilated into the life of the people. In this connection Mr. Wilson has much to say upon a matter that is all too imperfectly understood, and he draws a picture which must awaken the enthusiasm of all whose sympathies truly lie with Architecture.

Architects' Architecture.

THE obvious conclusion to be drawn from the early part of Mr. Wilson's paper is that we should try and reawaken the impulses and the conditions of labour under which the great Architectural epochs throve, if our own Architecture is ever to take place in the same rank with that of the Middle Ages; and this is the line of reasoning which the author has followed. In applying his principles we think Mr. Wilson is least happy. He admits that "to evolve living art out of this muddle of dead systems seems almost hopeless," and the practical suggestions he offers to those who would now set about and evolve this "living art" out of the muddle, necessarily constitute somewhat of an anti-climax to the wide, general regard and tense strenuous method in which he has dealt with his subject in the body of his paper. If the substantial and essential truth of Mr. Wilson's contention, which all may put to the test of their historical knowledge, their observation, and their convictions, were but generally acknowledged and admitted, the men whose enthusiasm best qualified them to advance the principles—to evolve this living art—will discover or compel the opportunity they desire. Some men there will be who will cry aloud at the new creed, "What! am I to give up my 5 per cent. on the contract and my 2½ per cent. on the quantities, and start at a carpenter's bench?" But anyone who should raise such a protest stands convicted as useless to the cause. In the light of these new principles he is "damned from here to eternity." Not only is he opposed to the principles put forward by Mr. Wilson, but he has no understanding of what they mean or imply.

Liability of Employers.

FROM the Queen's Bench we have a remarkable instance of the irresponsibility of the English working man, and the protection that is extended to him by the State. The plaintiff in an action for compensation—a youth of nineteen—joined it seems a street crowd that was watching some workmen erect an iron electric light standard in the Chalk Farm Road. The plaintiff, with the rest of the crowd, declined to move away when warned of the danger, and when in moving the standard to allow a tram to pass, it fell over, plaintiff's foot was crushed so badly that the surgeons had to cut part of it off. It is a wholesome maxim which lays down that a fool is well paid with the fruit of his folly, but although it was shown that the

defendant had used all due care in his operations, a discriminating British jury awarded the street-gazer a sum of £300. He was a plumber, the defendant was an employer. The plaintiff will, no doubt, avail himself of any opportunity that may present itself to lose a bit more of his foot on the same terms. It is difficult to understand what an unfortunate vestry contractor is to do in such a case. He may not hustle the Queen's subjects upon the public road, he cannot stop the tram service, and he cannot command a cordon of police at will. If plaintiff had been killed outright, his case would have won small sympathy; and unless the defendant is a man of transcendental virtues, he must be heartily sorry that he was not.

The East End Water Famine.

THE examination of the chief engineer to the East London Water Company, before the Royal commission, establishes a fact which has for some time been pretty clear, namely, that the late so-called "water famine" was due, not so much to lack of water, as to reckless waste. The chief cause for the trouble seems to have been lack of proper appliances to collect the water. It was a "cistern famine" more than any other sort. People left the taps open, filled what vessels they had, and let them run over. In one part, the sewer men could not remain in the sewers for the flood, which fell directly the turncock turned off the water. Throughout the drought the domestic supply never fell lower than eighteen gallons per head a day. By a more careful husbanding of their water early in the year, this Company states that it can meet all demands should a similar scarcity of rain occur during the next or following summers. We would suggest also that it would be well to enforce the use of proper cisterns. It seems that cisterns are required under the regulations of the Company, but the rules on the subject are evaded. In some houses, cisterns of wholly inadequate size, are fitted, and in others the cistern is only put in in order to secure a supply, and so soon as the water is turned on is taken away again. In this way one cistern has been made to serve a whole row of houses. We have heard of the same use being made of an intercepting trap, but cisterns are not "covered in," and there should be no difficulty in securing a fulfilment of the rules.

THE question of rebuilding the Central School of Arts and Crafts in Regent Street is being discussed. The school has only been in existence two years, during which time it has grown altogether beyond the capacity of the present temporary premises. Last session there were 539 students on the books, of whom about 140 attended every night. The annual cost of maintenance is £3000, and the return from fees only £150. The fees, of course, are merely a pledge of earnest purpose, not at all a serious contribution towards the expenses. The Technical Education Board proposes to acquire the leasehold interest of Oxford Mansions, within a few yards of the existing school.

MR. H. B. BRABAZON'S water colour drawings and pastels at the Goupil Gallery have that exquisite certainty of statement and that delightful charm of suggestion which are only found combined in the work of an artist who has in the mastering of his craft never forgotten the obligations he owes to Nature. Years of faithful practice are needed to reach such a level of technical proficiency as he has gained, and prolonged observation of the most sensitive kind will alone give the intimate knowledge of the open air which he shows in every touch. The exhibition is extremely important as a display of command over materials; but it is of the highest possible value as an assertion of principles that have been tested and perfected during a long life devoted to artistic aims of exceptional purity.

ARTS AND CRAFTS

And their Relation to Architecture.*

By H. WILSON.

II.

NOW it must be evident that if Architecture is thus a natural, social, racial art, if it be produced not by the will of single individuals, but is the expression in masonry of the working of the time-spirit, then it must be clear that what we are doing to-day cannot be called Architecture simply because what passes for such is produced under quite different and quite artificial conditions. It may be interesting—to the sociologist; it may at times be beautiful; it is not, properly speaking, Architecture. Modern building, when it is beautiful, is always the work of artists who by hazard have made bricks and mortar their medium of expression. They would have done notable work in any material; but, in judging of the building of a nation, we must take the mass of it and not the sporadic works of men who were artists first and builders afterwards. Judged by the mass of building raised to-day, there is little to be proud of in the art that produces such works as—*any building each of you particularly dislike.*

This brings us down to our own day. The fact is that Renaissance is notable pre-eminently for architect's architecture. It is the work of

* A paper read before the Architectural Association on Friday, November 11th, 1898.

architects who design as distinguished from those who did. But though it and the Architecture of design was so produced, the men who did it were real craftsmen in the complete sense of the word. Look through any biography of the mediæval masters and you will find that they were almost without exception trained first as goldsmiths, painters, or sculptors, workers in wood, ivory, and mosaic—they were employed only as designer architects, when they had attained eminence in the crafts. The hard training of work in material had filled them with ideas and enlarged and rounded their ideals. Having mastered one or more arts before they touched design as a separate thing, their work had a sculptural completeness impossible of attainment in any other way. But we must not forget that much of this completeness was added after the design had been made by the unifying labours of the creative craftsmen associated in the guilds, then in the very height of their power. Though the skeleton designs were prepared by the master sculptor and the proportions settled before the building was begun, the designs were overgrown, veiled, and clothed by the individual creation of the special workman to whom each portion of the building was assigned. Those workmen trained under and elected into the guilds put into their work unhindered, though directed by the designer, all that their skill enabled them to express of ideas and the tradition of their guild, and for many years we do not perceive the necessarily mechanical methods to which the designer considered as the user of a separate faculty was necessarily reduced.

But these mechanical or scientific methods

are there, becoming more and more evident—as time goes on—until the building is turned into a mere sitting for a variety of the delicate and beautiful works of men who without ceasing to be artists are daily less associated in the vital design of the building. Their work ceases to have those organic relations to the whole which we find even in eighteenth century buildings in England. This because, though designed by architects, they were carried out by the master workmen, who, in almost all the details, had a free hand. The change goes on, the art of design is in the process of evolution into artifice; the designer becomes more and more specialised into a constructing draughtsman, the maker of graphic specifications for buildings instead of the actual maker of buildings. Little by little he loses hold of the guilds, and this causes the artist to become a specialist each in his own department; the guilds dissolve, and as the importance of the design increases their powers decrease, and that great tide of life—of whose existence they were the evidence—finally ebbs away, leaving as the last product of the Renaissance—the final flower of all that cultivation—the modern architect, high and dry on the arid peaks of individual effort, cut off from any possibility of doing as he might wish, condemned to the more than Sisyphean labour of producing something out of nothing, while deprived of means to do it. That is the position in which we found ourselves but a little while ago.

It is manifestly illogical to blame the architect for being the result of a perfectly natural process of evolution; it is equally illogical to expect from a man the work of a multitude, or to get from a molecule the momentum of a mass.

It is all very well to show why a thing is wrong, but it is important for us to know what we ourselves are to do—and this, though difficult, is not impossible. In the first place, as Architecture is built up by the harmonious co-operation of the natural aptitudes of many individuals, it is necessary for each to follow his own particular bent, and to devote himself to that work to which he feels most drawn. In the vast field of building there is ample room for the effective working of every talent and the display of every power. And, inasmuch as all the crafts are necessary to Architecture, there need be no strife for precedence, for we all, as in life, are interdependent. Just as there are diversities of gifts, but the same spirit, so there are diversities of crafts with the same art working in all, embracing all, inspiring all. The lead worker who does a fine font, the silversmith who creates a chalice, the modeller, the plasterer, the mason, the waller, and the sculptor, the carpenter, the joiner, and the carver are all necessary, and all equal, in so far as each does the work to the best of his ability. There is neither greater nor less in the kingdom of art—all are the servants of their own souls, as they are the servants of God—and that is the heart of the whole matter.

I do not mean by suggesting that each man should take up a craft, to advise the dilettantism which dallies for an hour or two in the evening over some easy bit of work, done at a loose end, without reference to any actual building, although even that is not to be despised if it leads to a truer perception of the nature of building. I mean this, that each should determine to be—as the old men were—a craftsman first and an architect afterwards, for it is futile to talk of directing the handicrafts if we are not in some degree craftsmen ourselves.

Moreover, the value of the craft study lies not alone in the manual and mental training we derive from it, but in this that the very processes of work suggest other designs, the original pencil sketch is modified or abandoned as the thing we make takes form. When we have done the work, and placed it in some corner of the studio, the critical faculty which was held somewhat in abeyance by the ardour of work reasserts itself, we see defects of design and remedy them. As the light fades or changes, the work takes on new aspects, and becomes the starting point of an entirely new and living set of ideas, a fruitful source of suggestion while it remains there. Whereas, when the original

NEREID. ONE OF THE ELGIN MARBLES IN THE BRITISH MUSEUM.

sketch, drawing, or design has been handed to a tradesman, not only do we lose the full power of modifying work in progress, not only do we lose the suggestiveness of process, but the work when done is neither our own nor the workman's, it is an illegitimate birth, and bears the marks of it on its face for all who have eyes to see. What is true of the lesser art is true of the greater—unless you live with your buildings, unless your craftsman's knowledge is hourly used to support up your artistic inspiration, and organise the work of other craftsmen associated with you, not all the drawings in the world will produce a building fit to be called a piece of Architecture. And that, in spite of the hopeful enthusiasm and the passionate earnestness which characterises the rising generation. Now having tried to tell you what might be our aim, let us consider how our object is to be accomplished.

This, again, though difficult, is not altogether impossible; we must first consider

already been made. This beginning is to be seen in the revival of interest in individual craftsmanship, and in the result of that revival the School of Art and Handicraft in Regent Street which you all know so well. I see beginnings of better things in the increasing numbers of men who are forsaking the easel for the furnace, the drawing-board for the banker, the office stool for the forge and the workshop. For many, perhaps most, architects this is impossible, but it is possible for everybody to co-operate with the men who are trying to improve the standard of work by doing work themselves.

This co-operation might take many forms. The decorative work required in any building, instead of being handed over to the commercial firms, might be entrusted to the various men now working who have made those crafts their own. The design would naturally be left to the craftsman, after the general scheme of the building had been explained. The amount of work which the

less acknowledged, is, when well and simply done, just as valuable to society as the beautiful craftsmanship which appeals to every passer-by. We cannot all be craftsmen, but there is room for all if we only make room for ourselves.

Moreover, that those architects who are favoured by fortune with a plenitude of building work have it in their power to create almost at once a school of associated craftsmen who might do for the buildings of to-day what the Associated Craftsmen of North Italy—led by such men as Orgagna, Niccolò Pisano, Lorenzino Maetani, Mino da Fiesole—did for the buildings of their day. All the elements are here. When we have sculptors like Alfred Gilbert, Thornycroft, Bates, Stirling Lee; painters galore; metal workers like Alexander Fisher, Nelson Dawson, Reynolds, with their pupils and followers—what more could we desire? Our happiness is always next door awaiting us. There is no need to search the world for it, and that true happiness we seek is found in the full activity

PANEL FROM THE FRIEZE OF THE PARTHENON: NOW IN THE BRITISH MUSEUM.

what our actual position is to-day. We, as the descendants, in point of time, from the scholar-architects, of the Renaissance, find ourselves in an age in which labour is organised, not to produce the finest kind of work, but to regulate the hours of labour and the rate of wages. The Trades Union takes the place of the guild. Separated thus from the very means by which fine building was done, architects are themselves organised into a profession, and, instead of being actually concerned in the work of building, produce briefs and diagrams from which erections are raised. Almost from necessity the methods of the counting-house have to be employed in the simulation of art. The man whose energy and intellectual labour supplies the directing power and lays down the lines of work is, also from necessity, very rarely present while that work is carried on. The specification, the contract drawings, and details are the modern substitute for co-operative design carried out under the eye of the master builder. How to begin to evolve living art out of this muddle of dead systems seems almost hopeless, but I believe that a beginning—and that a very hopeful one—has

architect would be spared is incalculable, and his building would gain in distinction.

The droves of young sculptors who now haunt the studios in search of work might win their spurs in architectural sculpture, which is practically a lost art; while the still more numerous painters might be given commissions for wall decoration, instead of handing that work over to the wealthy and over busy firms. And so on, round the whole crafts. In a very short time we shall have a large number of craftsmen who will be fit to erect buildings by themselves, without the aid of the professional architect.

This, however, does not by any means exhaust the ways in which the new architecture might develop. Those who do not feel called to the crafts could take up the engineering side of building—for the vast work of providing for our daily extending commerce must obviously go on. The necessity for careful honest engineering work, the still greater need for efficient and continual supervision, seems to me to offer numberless opportunities of congenial and remunerative work to capable men; and this work, though

of every faculty, in the opportunity of the complete and rounded development of the whole man. But it is essential that our architects should abate somewhat of the professional dignity which encloses them, and give the craftsmen freer play; then in time we may see a new Architectural Association on the ruins of the old, but it will only be done when we have for ever got rid of the architect as an isolated intellect, a being divorced from the art of building.

Colonel Prendergast, proposing a vote of thanks to Mr. Wilson, said it was always pleasant to hear a discourse from an enthusiast, and he was perfectly certain that Mr. Wilson was deeply imbued with enthusiasm in the Profession. There were heaps of "rocks" amongst the remarks they had heard, and it was a mistaken view to suppose that the workmen could be transposed to the position held by the architect in any great work where unity of design was required. Mr. Wilson had truly remarked that the ancient guilds had given way to Trades Unions. Now, when everything was a question of wages, how on

earth could we come to terms? There was no doubt the great workers of the Renaissance periods were allowed considerable freedom; in Spain the architect was known as the master builder—but he was also the architect. They could not put up a great building and allow every craftsman to do just as he pleased in it. There must necessarily be a directing mind; then if their workmen were of the right stuff they would supply that colouring, without which no great work was, in his opinion, altogether successful.

Mr. Halsey Ricardo seconded the vote of thanks. The work of the present day, he went on to say, was out of key with the life of the present day. They felt that the work going on to-day was extraordinarily interesting and extraordinarily able, and yet it was not in touch with the present day. The houses we were building would have a curious, pathetic interest in fifty years, like the houses built fifty years ago, when the Gothic revival was setting in. We had unequalled building

with three things prominent in his mind. First, the fascinating description of the old trade guilds of the past; second, the hope held out of the faulty methods of the present day being superseded by something better—a hope fostered by the attention given in the present day to technical education; lastly, they had just heard Mr. Halsey Ricardo's steel and concrete views, which had completed his feeling of bewilderment. He felt that there was so much to be said on the subject, that, instead of saying it, one had better think about it. He did feel that at the bottom of all these art questions there was one prime point. Are you going to be a man or a machine? We should welcome any effort which was made in the present day to change the hard mechanical lines upon which so much of our work was done and to make men more human by making them greater craftsmen. He thought there was great hope in that direction. It was most encouraging to note how the word "craft," which was almost

had his place, and so had the architect. If they allowed a body of craftsmen to take the place of the architect, and arrange the details of the building without a guiding mind, the result would be that the Architecture would be left out, and the building made up of a number of pieces of craftsmanship, which, although interesting in themselves, would be entirely separate, bearing no relation to each other. He could not see how it was possible to get rid of the architect, though, of course, it did not matter whether they called him an architect or a foreman so long as his was the master mind. He did not see that under present conditions, the craftsman's enthusiasm was seriously cramped.

Mr. Thomas Blashill confessed to a little surprise at the course Mr. Wilson had pursued. He agreed with and much appreciated the early part of his paper, wherein he treated of the question as to whether Architecture was, or was not, the mother of the arts. Here, Mr. Wilson's view was one they might consider,

PANEL FROM THE FRIEZE OF THE PARTHENON: NOW IN THE BRITISH MUSEUM.

facilities to-day. We could build in concrete, and we had other materials at our disposal, yet we proceeded building without regard to these facilities. Another new material was steel, which we used on the sly; if used vertically, it was cased in Doric columns, and if horizontally, it was thinly covered with stone to look like an impossible lintel. We did not know how to use this material, because we were not in touch with it. If we were we should use it more frankly and more methodically, scorning the present devices, which often gave our building the appearance of want of security and want of grit. We had extraordinary powers to-day which past centuries never had, and he hoped we should come to recognise those powers, and not ensconce ourselves behind some building of another date; this was insincere, and nothing insincere had any life in it.

Mr. Christopher Whall said his whole attention had been devoted to an endeavour to take in the intensely interesting—but rather too deep for oral delivery—remarks of Mr. Wilson. He found himself at the end of the evening

unknown as an English word thirty or forty years ago had passed into common currency. Technical education was a large matter. It was engaging the attention of the London County Council in a very marked manner and the actual results were, so far as his personal knowledge went, very encouraging. They could not hope for a living representation in the near future, of the picture of the Middle Ages, yet he hoped the feeling now abroad would grow.

Mr. H. T. Hare said that whilst agreeing with many things Mr. Wilson had said, he thought that an architect's life was too short to enable him to make himself a master of all the various arts and crafts which constituted Architecture. All that an architect could hope to do was to get a general knowledge, and, in some cases, a very superficial knowledge; and the architect who attempted to design all the various small pieces of craftsmanship which went to make up a building was guilty, he thought, of a good deal of presumption. He could not agree with the idea of abolishing the architect, as we now knew him, and putting the craftsman in his place. The craftsman

and, perhaps, hold. But when he drifted into the question of Architecture, which was entirely another thing, he began to differ from him. He had heard this kind of thing for nearer fifty than forty years in London lecture rooms, beginning with the old original Architectural Museum at the Coal Banks at Westminster, and one got a little hardened to it. The tone of dissatisfaction with everything going on was not, perhaps, very healthy; yet there was good in these addresses, and he hoped they would benefit by what Mr. Wilson had said—by receiving what was helpful in it, and rejecting what was not. He would not like to take the responsibility of suggesting to them that the road they were pursuing—pursuing under very general sanction—was wrong, that they should throw their present training to the wind and take up some particular craft. When they had sacrificed their careers they would be just as much dissatisfied with everybody all round. That, of course, was the view of the pessimist—and whether it was the national food or the national temperament that was the cause, pessimism was very often to the fore. Architecture, at any rate, was a

CHURCH OF SAN PETRONIO, BOLOGNA. DOORWAY BY JACOPO DELLA QUERCIA.

thing they were all in for; he did not think they were likely to give it up on any seductions or persuasions, and therefore he thought they ought to make the best of it. He did not see why a man should not succeed as well as an architect as his fellow as a sculptor. He recognised that our elders were wrong in drifting into copyism to the extent they had, but surely sooner or later we must come to something in the shape of a remedy. Hadn't we better try a little longer? His impression was that they were discouraged by such views as these. They should take up Architecture with the view, not of bricklayers, sculptors, or painters, but as architects, and call in the painter, the sculptor, and other craftsman when required. He had seen some buildings where the sculptor must have been called in first, he having afterward called in the architect and told him where to put the building. A Swiss chalet—the work very often of a village workman, afforded the latest specimen of original Architecture. The speaker agreed that steel and concrete had their uses, and we ought to pay a little more attention to them. We ought also to call in the sculptor and painter a great deal oftener than at present, but only when they were really required.

Mr. D. T. Fyfe summed up the situation by asking: Was Architecture to be the work of one man, or was a building to be erected by various craftsmen? It was for architects, more particularly young architects, to decide whether Arts and Crafts was the right road to Architecture. Personally he did not think the best results could be obtained, in erecting a large modern building, by the co-operation of a number of craftsmen, each concerned with his own particular craft, if the architect did not supply the dominating mind.

Mr. H. B. Creswell said he was thoroughly surprised that the meeting had not strongly endorsed Mr. Wilson's views. The members

of the A.A. were all grains of mustard seed, and that was why Mr. Wilson had read his paper to them. They had all seen the work of the early part of the present century and they knew there was nothing there worth anything whatever. The whole Gothic revival was a fraud and a farce. False in impulse, it had produced nothing of real value. They saw a fine church of the Gothic revival, and on first acquaintance it seemed to be pleasing; the next time they saw it they were annoyed, and on the next occasion they wanted to throw something at it. They felt they would like to assist in its demolition. Why? Because it was false; the impulse was entirely foreign to what its impulse should be. Mr. Thomas Blashill had put too literal an interpretation upon Mr. Wilson's remarks. Mr. Wilson sought to show what the right art impulse of the present day should be, and to point out that the direction in which we were going was not the direction of that art impulse which had given the world its great arts. Posterity would look back upon the present epoch to discover what was the characteristic note of the Architecture of to-day. And this characteristic note would be truly vile, if it were not conscientious and honest. That was an extraordinary thing about all art impulses; however rude and archaic, they had real value so long as they had the enthusiasm of the nation behind them. There were innumerable examples of the Elizabethan style which, although vile in composition, were acceptable because they carried the flavour of reality with them. As an individual instance, the work of William Blake, poet, painter, and decorative draughtsman, had no real value, because he shut himself up in a cell and painted his own feelings. His productions were pretty in themselves, but they had no position in Art. Posterity would gauge our work when we had completed it, and it was interesting to con-

sider what was the characteristic note of the present day. He had tried to follow this out, and had concluded that it was typified in public-house Architecture and underground lavatories. If he had done these things he would be proud of them, for they had been excellently well done, and the best scientific thought had been expended on them. During the last ten years in London, more marble had been used in this class of work than had been used in all the churches of England in a century. And of public-house Architecture, they could at least say that it was characteristic; it belonged to no other time. It was, of course, utterly vulgar, because a public-house was a vulgar place, and it expressed the public-house—a place for a drunken, muzzy man. Public-house Architecture was honest, and unless we saw to it that our Architecture was more honest, more sincere in its impulse, what he had indicated would go down to posterity as the individual note of the present century. Mr. Wilson's paper was most thoughtful and most true in its basis and in its essential meaning, and it ought to assist the growth of those various mustard seeds, of which he considered himself one.

Mr. G. M. Nicholson said one point had been overlooked in the discussion—the difficulties encountered by the modern architect, and which were not known a good many years ago. If they took London, for instance, where a good many buildings were put up, the architect here had, first of all, to consider how to use up every inch of space; he had to be extremely careful about light and air, and time and cost were very important factors. In the olden times cathedrals were put up without very great regard to time, and, further, labour was not quite so independent as it was to-day. If a workman wished to be artistic, it necessitated his working slowly, and, therefore, unless they had time and money to spend in decorating

their buildings, the artistic workman was not required. Even in building private houses, cost entered very largely into one's calculations. A man's first idea about his house was the required accommodation, and the second the limited cost. The architect had to put these two factors together, and, confronted with an absolutely rigid scale of wages, to work out the sum to the best advantage. The Trades' Union principle was that they must, even with the very worst workman, observe a minimum rate, and the consequence was that the best workmen were very high-priced now. The way in which architects met these modern conditions showed that, if anything, their skill was rather superior to the olden time people. The architect to-day had to deal with a commercially-minded people; he had to build speedily and with economy, even in Government buildings, and had to produce what the client asked for; he was really no more independent than a theatre. If the client wanted an economic building produced in a short time, the architect had to do it, and if he refused or failed, then he would soon be left with his ideals and nothing else.

The President (Mr. G. H. Fellowes Pryne) thought they owed abundant thanks to Mr. Wilson for his thoroughly enthusiastic paper. Mr. Wilson was so closely connected with their late friend Mr. J. D. Sedding, that they felt he really carried on, to a great extent, the enthusiasm of his master. Mr. Wilson had suggested an interesting line of thought, and although some of his views might appear extravagant, yet it was only by such extravagance that they could make men think there was something behind them. He thought there was a great deal behind what Mr. Wilson had said in that we were not as a body in touch with craftsmen as we should be. He could not go so far as to say that each of them should take up a craft. That seemed to him to be lowering the view of Architecture; as they looked upon it. He did not think it was reasonable; he did not think it was even practicable in any sense. He knew one or two persons who had given up Architecture for ironmongery, and they worked at it from a sincere art point of view, and made a bare living in the effort. He thought they could so regulate their education in all the crafts that they could be useful heads of the whole on one building. Take a man like William of Wykeham; he had a splendid capacity for planning and seeing what was right in other men's work, but they could not believe he was a workman himself. Mr. Wilson's picture of the craftsmen going to commercial cities in their caravans was beautifully idyllic, but a little too fanciful, he thought. In saying so, he did not wish it to be understood that he was not in sympathy with a great deal of what Mr. Wilson had said, and he greatly wished they had a school of crafts, where they might learn how to construct masonry and carpentry and how to model, so that they would at least be able to tell the craftsman whether he was doing right or wrong. Mr. Ricardo had opened up a new line of thought in his remarks on the question of materials. In building in the present day we had to meet a new state of things and had to deal with new materials, and surely if there was scope for anything it was in good design of wrought and cast iron and steel. We wanted good design, and not mere copies of good work, of which we saw so much. He felt that Mr. Lethaby and those who were with him in the arts and crafts movement were entering into the work with an honest endeavour to do the best they could for Architecture, and he believed that their work tended for good. However much they might believe the theory that Architecture was a growth of the crafts, they must not think they could suddenly create a style of their own—that they could build solely on a miserable foundation made by themselves. They must build with a knowledge of the past, and their education should be to understand the best in the past. To reject Classic and Gothic Architecture and to say it was all a mistake was utterly wrong; they must get from those styles and others the foundation of what to do in the future, though they should not copy them. He was amused at

Mr. Creswell's clever speech, but he entirely disagreed that the Gothic movement throughout was a dismal failure. There were men working in the Gothic movement with just the same sincerity as men were working to-day. Did they believe that Street worked with anything but an honest end; his work had the charm of individuality; it was not a copy of the past. It was the same with Pearson; go to any of his churches, and they had the mark of Pearson upon them. They might take Sedding himself. Surely he was a Gothicism, and certainly he was a magnificent example of a man who tried to feel for himself and stamp his work with his own individuality. Here they might take a lesson to heart.

The vote of thanks was carried, and, in acknowledging it, Mr. Wilson said his intention in going before the A.A. was to tell them, so far as he could, what were his own ideals in his own particular work. It was of no use his giving advice as to what he considered they ought to do; it was his part to tell them merely what difficulties he encountered in work similar to their own and what was his own particular solution—or rather what he considered was his solution. If he had showed them what somebody else had tried to do, he had fulfilled his purpose. And in what he had said against architecture, they must remember that he was himself an architect, and he had therefore been speaking against himself, because he happened to know where Architecture was weak at the present day. In saying this, however, he did not wish it to be understood that he did not feel there was a good deal in modern Architecture, that he did not realise its sincerity. The chief of the few objections made to the points in his paper was that he wanted a building erected by a large number of workmen and built in a heterogeneous fashion, the architect being a special craftsman, whose mind was the centre round which the work was going on. If they looked at history they would find that the men who did the most for Architecture had a special knowledge of the various crafts, and were deputed to make a plan, round which the various craftsmen crystallised their thoughts and ideals. The work of the future could be as the work of the past, only there should be a much wider aim. They should take advantage of new materials, and what they could not do themselves they should get others to do. In his opinion, the Architecture of the future must be co-operative Architecture, or it could not exist.

MEMORIAL stones were laid on Saturday week at the fire stations in course of erection in Mary Ann Street, North Woolwich, and High Street, Lewisham, respectively.

MR. HERBERT FINN has had the honour of submitting, for Her Majesty's inspection, the picture which he has painted, entitled, "The South-West View of Canterbury Cathedral.

GERMAN archaeologists are about to explore Mesopotamia. The expedition will start next month under the conduct of Dr. Robert Koldewey, who was exploring in the same field last winter. It is understood that the expedition's plan of operations will require a series of years for its execution.

MR. E. C. WHEATER, of Newcastle-upon-Tyne, has sold one of the most valuable blocks of property in the centre of Newcastle-upon-Tyne, known as the Central Exchange Buildings, for a sum between £250,000 and £500,000. This block of buildings embraces a theatre, an hotel, a café, a large restaurant, art gallery and club, and numerous shops and offices, the whole standing on an area of 3370 square yards.

UNDER the supervision of the architect's department of the London County Council, the destruction has been completed of St. Mary the Virgin's Church, in Charing Cross Road. Twelve months ago the effects of decay became so dangerously obtrusive that the County Council, failing to discover any responsible trustees, were compelled to shore up the edifice. Now all that remains of St. Mary's is represented by the modern front of red brick and tumbled walls in the rear surrounded by a hoarding.

MODERN ARCHITECTURAL TENDENCIES.

By A. R. JEMMETT.

WE published Mr. H. V. Lanchester's essay on Modern Architectural Tendencies, read before the Discussion Section of the A.A. on Nov. 4th, in our last issue. Mr. A. R. Jemmett and Mr. Elgood also contributed essays. Mr. Jemmett's remarks are summarised below.

Mr. Jemmett thought that there were plenty of tendencies, but that few of them were architectural. Few of those advanced by Mr. Elgood, such as the habit of running a cornice up a gable, were of more importance than the tendency to draw with vulcanite set squares in place of wooden ones, or than the latest tendency in neckties. He looked upon these things as passing fashions, like the fashion for green furniture, that would soon pass and leave us no further advanced than before. The principal tendency, he noticed, was one towards eccentricity for its own sake—everyone trying to go one better than his neighbour, without any reason or meaning; a tendency to think more of individual reputations than the advancement of Architecture; to exalt the artist above his Art, to the detriment of both. He was of opinion that to be of any value, and to be worth serious discussion, a tendency must be one of mind and intellect, and not merely one of feeling or sentiment. If we want progress, we must have it on certain definite lines, following certain principles for which reasons could be given. Mr. Elgood spoke of a tendency towards simplicity. Well, was this merely a passing fancy, a matter of sentiment, or an appeal to the reason, that it was best to express oneself in the simplest possible terms?

With what Mr. Lanchester said about our lack of technical training he entirely agreed, and thought that this was what made us so amenable to every passing craze. We had plenty of ideas, but we lacked the training necessary to express them; we were like painters who could not paint, or musicians ignorant of harmony, or pianists whose fingers were not supple. This rendered us incapable of completely realising to ourselves beforehand the effect we wished to produce. He could not quite follow Mr. Lanchester in all he said as to the continuance of the classic tradition, as he was one of those who still cherished some hope of a new style founded on, or suggested by, the logical use of materials. On this point he thought that Viollet-le-Duc had not been quoted quite accurately; he had qualified elsewhere any statement that a new style can be evolved simply by this means. With regard to the names mentioned of those who had broken away from the classic tradition, and had carried many weaker minds with them, he did not care to discuss individuals; but, while having the greatest respect and admiration for the personalities of these men, he could not follow them or advise others to do so. Perhaps they had been influenced to some extent by the modern craving for notoriety.

With regard to what went on abroad, he thought we did not know enough; we were too provincial altogether, and content with the little local reputations of our corner of the world. A greater knowledge of foreign work would help to bring our tendencies more in line with the general advance of human thought. Our present state was chaotic, and it was difficult to discover any real tendency worth discussing, other than a sentiment which might not last; though he had hopes that there might be a tendency towards the rational use of material, and towards a general truthfulness of expression. If so, progress on these lines would be possible.

THE Liverpool Architectural Society paid a visit of inspection to the Thompson-Yates new laboratories of pathology and physiology (Mr. Alfred Waterhouse, R.A., architect), at University College and the School of Hygiene, Ashton Street, on Saturday, the 19th instant.

PROBLEMS OF LONDON STREETS.

By SIR JOHN WOLFE BARRY.

AT the first meeting of the 145th session of the Society of Arts, held at John Street, Adelphi, W.C., on Wednesday last, Sir J. Wolfe Barry, F.R.S., the new chairman of the Council, delivered an opening address on the "Internal Traffic of London."—Sir J. Wolfe Barry said the particular question he proposed to consider was that of the means of communication of London's inhabitants with each other by means of its streets and thoroughfares. This he took to be one of the pressing matters of the present time, not only in respect of the existing state of things, but still more in view of the future requirements of our ever-growing population, and if he could bring forward sufficient information and such a view of the questions involved as to induce some systematic consideration of that great subject, he should feel his labour had not been thrown away. No one who had lived in London could, he said, doubt that the pressure on the streets was getting yearly heavier and heavier, and becoming more and more unmanageable. Considering the

NEW STREETS AND WIDENINGS OF STREETS

effected in the last fifty years or so with the view of facilitating the constantly growing streams of traffic, he remarked on the smallness of the mileage and capital expended as compared with the outlays of railway and tramway companies. In the matter of street improvements in London, one could not but notice an almost entire absence of grasp of a large subject, and in the history of the past forty years, we looked in vain for any new arterial thoroughfares traversing inner London from end to end, and proportioned in width to the demands upon them at different parts of their route. On the contrary, we found in the new streets, as in the old, that the nearer they were to the heaviest of the traffic the narrower they were in absolute dimensions. Cheapside, Fleet Street, Piccadilly, the Strand, Marylebone, and Euston Roads remained very much as they were fifty years ago, when the traffic was a mere fraction of what it is now. He desired to speak with all respect of those who executed the idea of Regent Street, for Nash's wide Waterloo Place and Regent Street, with its circuses at Piccadilly and Oxford Street, was a work conceived in a large-minded way. But most at least of modern street improvements seemed

PIECEMEAL AND PATCHWORK ENTERPRISES

narrowed to the smallest dimensions that would pass muster, and without any but the most meagre provision for the future, or, except in the case of Regent Street, the slightest attempt at systematic artistic treatment. In fact, there had been and was now a hitherto incurable *petitesse* in dealing with such matters in London which was in great contrast to what we saw in foreign cities of far less importance and wealth. His plea was that to meet the traffic of London it was not so much additional railways, underground or overground, traversing the town and connected with the suburbs, that were wanted as wide arterial improvements of the streets themselves. Strictly urban railways, or rather trains that only traversed the town itself, though carrying immense numbers of passengers, had not dealt with the question, and would not produce the desired result of relieving the streets; on the contrary, they tended to add to the congestion from the point of view of both urban movements and suburban influx. In his judgment street improvements in London should be considered as a whole and in a large-minded way, unless we were to be doomed to perpetual disappointment. A scheme of new main thoroughfares of adequate width for present and future traffic should be laid down, and realised as time and finance permitted. There should be continuity of effort towards radical amelioration by the construction of great main lines of through communication as distinguished from merely local

improvements, and all local improvements, as was the case in Paris and other foreign cities, should be devised so as to form parts of a harmonious whole. Apart from wide streets, a matter which had been too much lost sight of, was the provision of means for allowing the north-and-south traffic to cross the east-and-west traffic with the least possible confusion. If some means could be devised for the crossing of north-and-south traffic over or under that going east and west at places like Hyde Park Corner, Piccadilly Circus, Ludgate Hill, and Wellington Street, the relief to the main thoroughfares at those points would be enormous. The results would be well worth the expenditure, heavy though it might be, and, having given some consideration to the subject at the points above mentioned, he could say there was nothing impracticable in the suggestion. After a few words on the thoroughfares of the south side of the Thames, the speaker referred to what he recognised as of more importance and urgency—viz., the north bank and the three main lines of east and west communication. The Euston Road (with Praed Street and Chapel Street at the west and the Pentonville and City Roads at the east), Oxford Street (including Uxbridge Road, Holborn, and Cheapside), and the Strand (including Fleet Street, Ludgate Hill, and Cannon Street), were all most ludicrously inadequate. In the case of the Euston Road route, where shortcomings were the least glaring, the necessary widenings and improvements would involve less serious consequences than in the other thoroughfares. The Oxford Street route, with the exception of some narrow places near Notting Hill Gate Station and the confused crossing at the Marble Arch, was fairly adequate as far east as Edgware Road; but from that point a radical improvement, either by means of important widenings or by a new street, was wanted, and should be carried through the City so as to connect at its eastern end with the Mile End Road. In the case of the Strand, Fleet Street, and Piccadilly it seemed to him that the only course was a systematic widening of all three thoroughfares, with

A BROAD DIAGONAL STREET FROM PICCADILLY CIRCUS,

via Coventry Street, to join the widened Strand near Wellington Street. He thought they wanted one new and spacious thoroughfare east and west, about 120ft. wide—as wide, that was, as Whitehall opposite the Horse Guards. It might leave the Bayswater Road near Westbourne Terrace, follow the line of Wigmore Street to Russell Square behind the British Museum, and thence run to near Broad Street Station. In addition, there should be two or three thoroughfares north and south, slightly less in width, which should be carried over the east and west route by bridges at the points of intersection, and all these new routes should have a raised or sunken road for bicycles, so that they should not mix either with vehicular or pedestrian traffic. The cost of such a work doubtless presented rather an alarming prospect, for a street 120ft. wide and four or five miles long must mean many millions of money, though the recoupment from the new frontages would be very important. Such, however, was the kind of undertaking required for London of the future. In conclusion he said he could not but think that the relief of the present congestion of our streets by a well-considered enlargement of the arteries of London was a subject which must commend itself as of primary importance to the whole city—nay, more, to the whole nation. It was worthy of the fullest consideration by those who would devote themselves to no peddling treatment, but to such a large-minded plan of a remodelled town as was made by Wren in respect of the City of London after the great fire, and as had been so successfully carried out in Paris, where he supposed the cost of land and construction differed but little from similar values in London.

TEMPSFORD HALL, a fine modern English mansion in Bedfordshire, has been destroyed by fire.

WHO IS TO SHOW THE WAY?

THE ADVANCEMENT OF ARCHITECTURE.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Prof. Aitchison in his paper on the Advancement of Architecture says: "The thing we want most is the advancement of Architecture, but who is to show us the way?"

The same question may be asked by every member of each art, profession or craft who sighs for progress. By advancement I understand "originality." First define the word so often misused; then let each and every architect, artist, professor, or craftsman realise that his dearest dreams and most cherished ideals are most lacking in the one thing he continually strives after, namely, originality. Then from the debasement of his pride and conceit (which are the besetting sins of all artists) let him aim and create.

Does each architect really understand that almost every trick of his pencil and every part of his work is simply what he has learnt from his preceptor; or is a copy (perhaps unconscious) of something that his senses have impressed upon his memory? If not, let him analyse his thoughts when designing, and in most cases I think he will find that this is the case.

Now for the remedy. Originality is for a new generation. My scheme is something ideal, and I am afraid very impracticable in these days of bicycles, motor cars, and all kinds of speed. But here it is, and I believe it deserves the consideration of all thinking men, however impossible it may seem.

Each art, profession, and craft should form itself into a guild, after the style of the old guilds of London. Each guild should build itself a college, to be called after it, as "The Architectural College." Lastly, and most important, each college should educate its pupils from childhood, primarily in the art or craft that it professed. Everything—history, geography, and mathematics—should be the history, geography, and mathematics of the proposed profession of the learner. Then where would be the duffer? At the age of twenty-five, a man would be perfect in his profession, and would have acquired the general information necessary to his state in life as part and parcel of his professional knowledge. There we have a man with all the knowledge that his contemporaries can impart to him at twenty-five years of age, or younger, ready to start in the battle of life, with his best and most vigorous years to devote to the greatest and most difficult study of all, originality.—I am, dear Sir, yours faithfully,

London, S.W.

ROBERT CURLING.

A CHURCH to cost about £8000 is to be built at Kensal Rise to the memory of the late Dean Vaughan. Messrs. J. E. K. and J. P. Cutts have prepared the drawings for the building, which is to be erected as soon as possible. It will seat 750 persons.

The new national schools connected with the Parish of St. Stephen, Paddington, were opened last Thursday. The cost of the entire work, including the site, has been £10,878. The schools form a splendid group of buildings, and comprise departments for boys, girls, and infants, and a large hall for parochial purposes.

At last, after many weary vicissitudes, a substantial step has been taken by the Congregationalists of London to rebuild upon the old site in Tottenham Court Road a chapel worthy of succession to George Whitefield's historic tabernacle. The ceremony of relaying the original foundation stone has just been performed by Dr. Joseph Parker. The designs for the new church have been prepared by Mr. Rowland Plumbe, and show a spacious and handsome building in red brick and white stone dressings. It will seat 1150 persons, while the hall beneath will accommodate 800. The new chapel will be the third on this site, the second having been built in 1831, and it was then the largest Nonconformist chapel in the kingdom.

RECORDS OF ENGLISH CATHEDRALS.*

By FRANCIS BOND, M.A., F.G.S.

MR. BOND opened his subject by a reference to his own researches at Waltham Abbey Church, which had led him to the conclusion that no portion of the work was of the early date assigned to it by Professor Freeman and other authorities—viz. the eleventh century; it had nothing in common with either English or Norman work of that period. Wells Cathedral was another example of what the lecturer termed archaeological aberration. Some authorities dated the nave after the west front, though the nave was far more archaic in character; Professor Willis dated the west front after the nave, but put both a whole generation too late. Many instances of similar error might be cited, pointing to some

FLAW IN THE METHODS OF RESEARCH.

The cause was to be traced to the wrong estimate of the comparative value of documentary and architectural evidence. Documentary evidence consisted of the references, direct or indirect, to the history of the building, in annals, monastic chroniclers, fabric rolls, registers, wills, &c.; architectural evidence was to be sought in the stones and mortar. Discussing Professor Willis's opinion in favour of documentary evidence, the lecturer observed that few of the statements as to building operations in the cathedrals were made by contemporaries; frequently the authors lived generations or even centuries later. The ascription of the choir, transepts, and nave of Wells, as well as the west front, to Bishop Jocelin was based on a statement of Bishop Godwin, who lived in the sixteenth century, which was itself based on an anonymous MS. written in the fifteenth century. Contemporary evidence could not always be trusted.

MONASTIC AND MEDIEVAL CHRONICLERS

had likes and dislikes, and sometimes deliberately misrepresented and falsified their history—Matthew Paris's own admission was a case in point. Any good work, any fine building, erected by the unpopular may have been attributed to the popular abbot or bishop. In this connection the lecturer referred to Bishop Aquablanca's work at Hereford Cathedral, which had been ascribed to Bishop Swinfield, and disproved the statement of Swapham and Abbot John, monastic chroniclers of Peterborough, that Abbot Benedict built the whole nave from the central tower to the west front. The chroniclers were not architects—their language lacked precision and definiteness; and it was dangerous to build theories on their curt and nebulous statements. They were often unintentionally misleading. The lecturer referred to a possible instance in the record in Simeon's "Continuator" of Flambard's work at Durham. Again the chronicler's statements had been applied to the wrong building—an instance at Ripon Minster was cited. There were

HUGE GAPS IN THE CHRONICLES;

some of the biggest works were not mentioned at all. It did not follow because there was no record of work by a particular bishop or abbot that therefore he did nothing. New evidence may be forthcoming, and the prelate who had been credited with no work might turn out to have been building busily all the time. As examples of the danger of building theories on negative evidence, the lecturer showed how such theories had been upset in the cases of Wells and Worcester Cathedrals. Dates of consecration were not always of value; there were dozens of examples which had no reference to the completion of a cathedral or of any important part of it. Neither was it safe to infer that, because services commenced in a certain year, the building or any particular portion of it was completed; inferences of this kind were proved incorrect at Durham and Peterborough. The evidence, however, of contemporary fabric rolls, charter registers, etc.,

was of the utmost value if it could be properly read and understood. But the Latin of those documents were not easy to read; the abbreviations had proved a fertile source of error. MSS. had been carelessly copied or carelessly printed; in some cases terms had been altogether misunderstood. Striking instances of error from one or other of these causes were referred to in connection with Lincoln, Exeter, and Hereford. Examples were further quoted showing that implicit confidence could not always be placed in

MURAL INSCRIPTIONS.

Concerning architectural evidence, the comparative rather than the historical method of investigation, the lecturer considered that nowadays this class of evidence, subject to certain minor reservations, might safely be relied on. Allowance must be made for the progressive tendencies of the monks of the eleventh and twelfth centuries, for the conservatism of those of the thirteenth. The monks of Peterborough and Norwich retained their Romanesque minsters almost unaltered to the last. The canons of Lincoln, York, Lichfield, and Exeter swept away almost every trace of Norman work. The abbey church of St. Germer, near Beauvais, Oxford Cathedral, and Wimborne Minster, furnished further examples of conservatism. Builders of the first half of the fourteenth century showed reverence for old work, and refused to impair the effect of good old design; but they put their own trade-mark on the detail. Various instances were given, and some examples of "architectural forgery" referred to, as at Rochester, Durham, Galilee, and notably the gateway of College Green, Bristol, and the church of Ottery St. Mary—buildings deliberately designed

IN THE SPIRIT OF A BYGONE STYLE.

The detail, however, prevents the student misinterpreting the evidence of the Architecture. It was possible to be misled by the precocity and cleverness of a mediæval designer. Here and there a great original genius sprang forth, such as Suger's architect at St. Denis, who gave the world fully developed and harmonised Gothic construction in 1140, two generations before the choir of Lincoln Minster was produced. St. Urbain, Troyes, represented the full and final consummation of Gothic Architecture, which was not reached elsewhere for more than a generation. Gloucester Cathedral afforded another instance of precocious genius. In conclusion, the lecturer expressed his conviction as to the general trustworthiness of architectural evidence, and quoted in support the authority of Mr. Barr Ferree and Mr. Edmund Sharpe. The architectural should be studied before the documentary evidence, and, if the former conflict with the latter, then the latter should go to the wall.

Mr. H. L. Florence, the Vice-President, was in the chair, and read, at the conclusion of the paper, a letter from the Bishop of London, apologising for being unable to accept the invitation of the Royal Institute of British Architects to be present at the meeting. Dr. Creighton, proceeding to discuss the subject of the paper, said:—

"I am obliged to you for sending me Mr. Bond's very interesting paper. Its main contention is that documentary evidence needs criticism in every case, and it is obvious that internal evidence supplied by Architecture is one element in this criticism. The strength of this internal evidence grows by the continued application of the comparative method. It is much stronger now than it was thirty years ago. But I do not think that its results destroy the credibility of documentary evidence, but only teach us to interpret more accurately the exact meaning of the words and discriminate between an exact and an approximate statement."

The Chairman remarked that the Bishop did not throw much light on the subject; his letter, he thought, might be fittingly described as "judicious hedging." The discussion was opened with a lengthy address by Mr. St. John Hope, who was followed by Mr. William White, Mr. H. H. Statham, and Mr. Hudson.

NEW POST OFFICE AT DUNDEE.

THE new building in Meadowside, Dundee, which will soon be the home of the Dundee Post Office and its cognate departments, is now practically out of the builders' hands. The piece of ground on which the new building stands is almost a square. It is bounded on three sides by streets, and on the fourth by other buildings. Two of the sides are available for "frontages"—Meadowside and Constitution Road—have been built upon, and the space at Euclid Street is kept vacant for future necessities. The outer building consists of three stories and attics, and in the square behind there has been erected the sorting room of one story, with high ceiling and roof lights. On the basement floor of the principal block there is the battery room, so essential a part in the economy of a telegraph office, where the most modern and complete apparatus is being erected. An adjoining room is used for storage purposes. Another room is to be used as a mechanics' shop, and still another apartment is being fitted up as a telegraph boys' retiring room. The principal room on the ground floor is the public office. It is entered from Meadowside by a large and handsome doorway and porch. The doorway is to be protected by

AN ARTISTIC WROUGHT IRON GATE,

not yet placed *in situ*. The doorway is a very striking piece of workmanship, with its arched top, decorated keystone, Corinthian capitals, and life-sized figures. The porch is also an artistic arrangement. It gives into a large public office. The whole length of the Meadowside frontage is occupied by the public office. To the left, through the vestibule in the Constitution Road corner tower, entrance is gained to the telegraph office, where the familiar boxes for the filling in of forms have been fitted up. By means of a tube the telegrams are sent to the instrument room. To the left of the telegraph office is the telephone room, with "silent" boxes, and still further in the same direction the visitor enters the telegram delivery room, where the messages which have been received are sent in order to be delivered throughout the city. These three rooms occupy the space fronting Constitution Road. At the Euclid Street and Constitution Road corner is

A TOWER CONTAINING THE STAIRCASE,

which winds its way to the top of the building, and connects the various stories. The first floor is occupied mainly by private rooms. *Inter alia* it contains women's cloak-rooms, postmaster's rooms, telegraph schools, telegraph engineer's rooms, and male clerks' retiring room. On this floor also is a new feature in postal economy—namely, a dining-hall and kitchen for the staff. On the second floor are situated the telegraph and telephone instrument rooms. On the attic story the caretaker's house and other miscellaneous rooms are situated. The lighting throughout is to be by electricity.

LONDON has got another clock. It is to be seen in the Strand, outside the offices of the Morning Post, and where it differs from other public time-tellers is in its hands. At night they are illuminated by electricity in some mysterious way; so are the letters that indicate the hours. The rest of the clock is black iron. The ironwork that frames the clock is a well-executed piece of work; and altogether the structure is a prominent and a not unornamental feature of the Strand. What London really wants is more silent-tongued clocks and fewer bells. When watches and timepieces were comparative rarities the public clock struck the hours to inform the populace what time it was. In these days, when every schoolboy has a watch, the necessity for the proclaiming of the hours and quarters from numberless clock towers has disappeared, and it would be a good thing to dispense with much of this superfluous noise in this, the noisiest city in the world. The people who find the superabundance of bells the greatest nuisance are the residents in the various inns of court about Fleet Street and Holborn.

* Summary of a paper "On the Comparative Value of Documentary and Architectural Evidence in Establishing the Chronology of the English Cathedrals," read before the Royal Institute of British Architects on Monday, 21st November, 1898.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

November 23rd, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

It has been decided to restore the Palace of Versailles and the not less celebrated Trianon for the Paris Exhibition of 1900. The Minister of Fine Arts has asked Parliament for a vote of 300,000*fr.* for the purpose. The famous crystal gallery, where the Kaiser's illustrious grandfather was proclaimed Emperor, will be renovated, the Orangerie will be repaired, the façades of the palace towards the park restored, and the Grand and Petit Trianon, which now look neglected and are becoming dilapidated, will also be put into a state of thorough repair.

The Colonial Office being now provided with a complete installation of electric light, advantage is to be taken of the presence of workmen on the premises to redecorate the building, which is at present chiefly remarkable for dust and dowdiness. A committee of taste is now elaborating a scheme of decoration worthy of the importance of the department. While distinguished foreign visitors are invariably impressed by the ornate decorations and excellent tapestries at the Foreign Office, they can hardly be expected to be favourably struck by the dingy ceilings and woodwork and the sombre-coloured portraits which are so noticeable in the building where Mr. Chamberlain works. An attempt will now be made to bring the interior of the Colonial Office more in harmony with its imposing external appearance.

RECENT excavations at Jerusalem by the Palestine Exploration Fund have resulted in some very curious discoveries. In the Tyropæon Valley Dr. Bliss found the main sewer of an ancient city, and traced it to a gateway in the old wall below Siloam. The sewer, apparently a continuation of that discovered by Sir Charles Warren beneath Robinson's Arch, is said to explain the curious statement of Antoninus that if anything that would swim were thrown into the running water beside the Altar of Abraham at Golgotha, it would be found again at Siloam. It may be suggested that the sewer was originally connected with the remarkable underground channel and tanks explored by Sir Charles Warren in the Kedron Valley, and that probably these works constituted the drainage system of ancient Jerusalem. Above the drain a broad paved street was discovered, and followed for some distance up and down the valley. Possibly it is the work of Agrippa, who is said to have paved the city with white stone.

THE old quarry on the borders of Dartmoor from which the granite was obtained to build

London Bridge, has recently claimed some attention. This now deserted quarry is situated on the side of Hey Tor, one of the rocky hills that fringe the southern side of the moorland, near Bovey Tracey. London Bridge was opened some seventy years ago, and since then the curious granite tramway that led from the quarry to the highway near Bovey Tracey has been disused. Now almost the last traces of it are being carted away, for the local farmers find the great slabs of granite exceedingly useful for gate posts. The stone was quarried here, and run down in trucks along the grooved slabs; then carted to the town of Newton Abbot, eight miles away, and thence barged down the estuary of the river Teign to Teignmouth, six miles distant, whence it was transhipped, and taken by sailing vessels to the Port of London.

ONE of the most famous historic landmarks in the New World is doomed to destruction. Bradlee House, Boston, is on the eve of demolition to make way for a modern business structure. Bradlee House was built in 1771, and it was in the kitchen that the leaders of the Boston Tea Party disguised themselves as Indians on the evening of December 16th, before they went to the wharf, when the cargo of tea was thrown into Boston Harbour. The land on which Bradlee House is built was originally purchased for a few hundred dollars; it is now worth £20,000.

A STRANGE discovery has just been made under the paving stones in the old cloisters-court at St. Stephen's and close to the spot where M.P.'s hang up their hats and coats on their way to the chamber. The walls of this part of the House of Commons were recently found to be in a somewhat unstable condition, and a staff of workmen were accordingly employed to shore up the weak portions and to strengthen and generally improve the very faulty foundations. While so engaged the men came upon portions of two skeletons, and by and by upon two skulls not far beneath the surface of the ground. This part of St. Stephen's is very aged, and was not touched by the fire in the Forties, which destroyed the chamber itself and led to the building of the existing house.

AN announcement recently appeared in a contemporary to the effect that in the course of a few days Drapers' Hall will be as non-existent as it was before the days of its builder, and that a City restaurant will take the place of a building with so many historical associations. Happily the statement has no foundation whatever in fact. Drapers' Hall is not threatened, and no City restaurant is about to take its place. Possibly the writer was led into error by the fact that, consequent on the sale to a firm of restaurateurs of the valuable frontage, Drapers' Hall will for the future take a somewhat more retired position than has been the case up to the present.

THE address delivered a few days ago by Sir W. B. Richmond at the Birmingham and Midland Institute was very well worthy of attention as an expression of the opinion of a great decorator concerning the prospects of decorative Art in this country. He commented very appreciatively upon the manner in which the limits of Art practice have widened during recent years, and upon the remarkable extension in the scope of Applied Art and sculpture which we are witnessing at the present time; and from the signs easily observable by everyone who studies modern developments he deduced many happy auguries for future progress. He argued that, important as picture painting unquestionably is as a branch of Art, it is steadily becoming recognised as by no means the only way open to the artist for the application of his powers. Other forms of practice, designing, decoration, and crafts of various kinds, are competing more and more strongly with purely pictorial work, and are fast gaining the complete acceptance of the public.

THAT he is correct in his statement of the position is beyond dispute. No one (says the

Globe) knows better than the painters themselves how much the interest which art lovers used to lavish upon pictures is now spread over all sorts of artistic details; and nowhere is the change of public conviction felt so strongly as in the studios of the men who have devoted themselves to pictorial work. Applied Art has become to them a very serious competitor, and the new direction of the public taste has very perceptibly affected their market. They must do as the sculptors have already done, meet the new movement half-way, and find methods of expression more in keeping with the new popular conviction. They could not do better than follow the example of Sir W. B. Richmond himself. Capable painter as he has proved himself to be, he has found in decorative work a field for his energies far wider than the producing of pictures could ever have given him; and it certainly cannot be said that his reputation as an artist has suffered in consequence.

NEVER was a public enterprise more completely justified by results than in the case of the Tower Bridge. The traffic over it is this year greater than ever. When one comes to watch the stream of vehicles and foot passengers crossing it, it cannot but be felt to be amazing that London Bridge should ever have been able to take it, or anything approaching it, in addition to the heavy traffic which at times really seems to be little diminished by the new outlet. It is somewhat surprising that the hydraulic lifts that were provided at the Tower Bridge for carrying up passengers to the high level footway when the bascules were open have never been found necessary. There they are if they were wanted, and they are, we believe, used by members of the staff employed at the bridge when they have occasion to go up aloft, but they have never been brought into use for the public. The fact is, the mechanism of the lifting roadway is so perfect in its action, and the way can be opened and shut so easily and rapidly, that there is little or no real saving of time by crossing above, and most people prefer to wait below and watch the always interesting process of opening and shutting. Most of those who go up do so from curiosity.

EVERYBODY knows that competition tends in almost every direction to become keener and keener. But one would hardly have supposed the Monument of London to be among the sufferers from it. Yet we have it on the authority of the Daily News that, ever since the Tower Bridge started up in rivalry, patronage has fallen off from the Monument. Official returns are said to show, however, that nearly 10,000 people climbed the merry height last August. At threepence apiece, that would bring in about £125 for the month. But that is said to be a considerable falling off from the receipts before that Gothic interloper straddled across the river and offered a free view of the Thames and London around. It is not so good a view of course. It is not so high, and the fabric was not designed for sightseers. The lofty passage-way across is merely a thoroughfare, and it is only with some difficulty that a good view may be got up and down the river. But then it is free to all comers, and it is supposed that a good many people go to see the famous bridge when they come to London, and find that the treadmill toil up its stony steps satisfies their ambition for climbing.

THE City of Birmingham has received a most munificent offer. Mr. Middlemore, the happy possessor of several of Burne-Jones's master-pieces, has promised to present them on certain conditions to the Council. He includes in his offer "Aspiration," by Mr. Watts, and Mr. Holman Hunt's beautiful "Triumph of the Innocents." If the offer be accepted, Lady Burne-Jones has also promised to present Mr. Watts's portrait of her husband—the work which the painter considers his best in this sort. The condition is that the Corporation shall build a new and improved Art Gallery. Birmingham is never deficient in civic pride. Mr. Middlemore's offer will no doubt be accepted, and Birmingham will thus become possessed of some of the greatest art treasures which this generation has produced.

COTTAGE RESIDENCE IN ESSEX. GEORGE E. CLARE, ARCHITECT.

The city is to be congratulated alike on its good fortune and on the public spirit of its citizens. Mr. Middlemore's gift will, at the same time, be a local memorial, of the most appropriate kind, to the great artist who was born and educated at Birmingham.

Was there any connection between Birmingham and the art of Burne-Jones? His biographers are generally so unkind to the Midland capital as to suggest that the repulsiveness of the actual surroundings in which Burne-Jones was born led him to the necessity of creating a beautiful world for himself in the realms of imagination. The inward eye certainly counts for more in these matters than the outward. Rossetti was born in a street off the Euston Road. He was an Italian at heart, but in the body he never set eyes on Italy. Mr. Armstrong, in his recently-published work on Gainsborough, calls attention to the fact that no great landscape painter has been born among grandiose scenery. Turner saw the light in Maiden Lane, a few doors off the Strand.

THE Housing of the Working Classes Committee brought up at a meeting of the London County Council a long report dealing with "the housing problem" in London, and asking the Council to lay down certain definite lines of policy with regard to their action under the Housing of the Working Classes Act, 1890. The committee recommended "(a) that it be the policy of the Council to proceed from time to time as opportunity shall offer with the acquisition under Part III. of the Housing of the Working Classes Act, 1890, of sites available for the erection of working-class dwellings within the county of London; (b) that all clearances which involve rehousing be done at the sole cost of the Council; (c) that housing accommodation should be provided for a number of persons equal to that of the working classes displaced by any scheme under the Housing of the Working Classes Act, 1890, or under the provisions of any Improvement Act; (d) that housing accommodation for persons displaced be provided within the county of London, but not necessarily in the immediate neighbourhood of the displacement, due consideration being given to the needs of those living on any particular area." Mr. Dickinson moved an amendment to refer the first recommendation back to the committee. After considerable discussion the amendment was agreed to. The remaining recommendations of the committee were then withdrawn.

THE art season which has just commenced, ought, from one point of view, to be a prosperous one. Unfortunately, it is not the point of view most interesting to the painter of the

day. It relates rather to the painting of pictures than to the disposal of them. We are all familiar with the wail of the artist when late winter in London is dark and foggy. He leaves so much to the last, and he seems always to believe in his star—or rather in his sun. But up to the beginning of the present month, all England over, we have had weather of exceptional brightness. We have not for years had a season in which the light has been so steadily good. Of course it ought to be a great landscape year. But artists are perverse. Their harvest seems almost independent of weather. We have had an unprecedented summer, and an autumn that seemed a prolongation of it. Just now, grey pictures seem most popular, or, at least, most put on the market.

BRISTOLIANS naturally take more than a passing interest in their Arcades. Dating from the year 1825—at which time, on the opening of the portion from St. James's Barton to the Horsefair, what is known as the Upper Arcade is described by Mr. John Latimer, in his "Annals of Bristol," as having been remarkably ornamental and graceful—they have fulfilled a useful purpose for business transactions, various generations of citizens having from time to time carried on business within their precincts. Structural and other improvements, with the object of being as much up-to-date as possible, have occasionally been made, says the Daily News, and at the present time much activity is manifest in the numerous shops there. The latest alteration, at any rate as far as the Upper Arcade is concerned, is the introduction of the electric light. For many years intending purchasers, as well as the proprietors of businesses, have realised the desirability of having "more light," and the development of the city's electrical plant afforded the desired opportunity. Now, the installation having been completed, the Arcade is very well lighted in the evenings. There are altogether eleven lights of 48 candle-power each, making a total of 528 candle-power.

IN turning over some ground adjacent to Selby Abbey (Yorks), there was found last week a curious silver seal of an oval shape, with what appears to be a red stone in the centre, bearing an engraving of two figures dancing. Round the edge in bold mediæval characters is the following inscription:—"Secutum fero luce." The vicar forwarded an impression of the seal to the British Museum, and the reply from the Keeper of Seals states that the seal is an interesting example of the use which was made of ancient gems in the Middle Ages. The stone in the centre is of late Roman work, and represents a pugilistic encounter before a terminal figure of Mercury, with a palm branch for the victor and the

usual water vase before it. The silver setting is mediæval, and was, no doubt, placed round the stone by some abbot of Selby early in the fourteenth century, when he chose the stone for his private seal. The inscription seems to mean, "I carry this (seal) hidden from the light." That is to say, "This is my secret or private seal," as distinct from the official seal which the abbot used in his private capacity.

THE proposal to erect a Hotel de Ville is once again attracting attention at Spring Gardens. At present the Council is housed in a most uncomfortable manner, and, because of the lack of accommodation, it is necessary to incur an increasing expenditure annually upon the leasing of houses to be fitted up as offices for departments that are crowded out. A building large enough to meet all requirements is an absolute necessity, and the taking of steps to secure permanent headquarters worthy of London's Parliament cannot be delayed much longer. It is, however, possible to embark on a too extravagant scheme, and the Council will be well advised to be modest in their ideas, and to come forward with a proposal of a less magnificent character than that which met with so untoward a fate a few years ago. Niggardliness no one will advocate; but, on the other hand, to show supreme contempt of the amount of the bill is going to quite the other extreme, and even the most public-spirited ratepayer is scarcely likely to be in favour of giving the Council *carte blanche*. The clearance of property for the Strand Improvement scheme will afford a fine opportunity for erecting appropriate offices.

A CORRESPONDENT writes to complain of the closing of the Tate Picture Gallery on the Sunday afternoons of the winter months. Could not the gallery, he suggests, be open till four p.m.? On visiting the building last Sunday, in ignorance of the rule, he found several other disappointed people who had journeyed there in vain, and no doubt a great many visitors had to turn empty away. It does, indeed, seem a pity that, on the day when Mr. Tate's generous gift to the nation could be most appreciated, the gallery should be closed, so long as the light is sufficient for seeing the pictures.

THE Austro-Hungarian Government, through its representative in London, has succeeded in obtaining the loan of a representative selection of the works exhibited from schools of art at the National Competition at South Kensington last August. This selection is now on view in Buda-pesth, and it is gratifying to feel that the usual order of things is inverted by the art students of that kingdom being invited to emulate the work of art students in our own country.

THE result of the Wrexham County Schools Competition has just been announced. The first premium is awarded to Mr. J. Henry Phillips, of St. John's Chambers, Cardiff; and the second to Mr. H. Teather, Shrewsbury. Messrs. Wilson and Moxham, of Swansea, and Mr. F. Bellis, of Bangor, have come in for special mention. The drawings are being exhibited at Wrexham this week—to-morrow is the last day.

COTTAGE RESIDENCE IN ESSEX.

THIS house was recently commenced for Mrs. Wright on about four acres of ground on the main road from Chelmsford to Braintree, near the picturesque village of Great Leighs. Owing to the scarcity of bricks in this locality, the upper part is being built in timber and buff coloured stone dashing, whilst the lower story is in 1½ in. hollow walling with red brick dressings, and the roof is covered with dark red Broseley tiles. The builder is Mr. J. S. Wright, of Little Leighs, and the architect Mr. George E. Clare, Chelmsford, who is erecting other cottages in the same village for Mr. S. Joslin.

The Law on Public Contracts.

By J. E. R. STEPHENS,
Barrister-at-Law.

THE law concerning contracts with public bodies must, in its operation, often touch those who are engaged in the building trades. To state briefly the law on the subject may, on occasion, be helpful.

The Crown, by its agents acting within the scope of their authority, can enter into contracts, and the Attorney-General, suing on behalf of the Crown, can enforce such contracts against the subject, and the subject can sue the Crown by petition of right. The procedure on petitions is regulated by 23 and 24 Vict. c. 34. The fiat of the sovereign endorsing the petition is essential, and in default of it no step can be taken. The procedure as to the Crown contracts in the Colonies is regulated by various local statutes, some of which provide for suits against a Secretary of State. The agent-general of a colony cannot be sued in England as the representative of the colony, or otherwise, for contracts entered into by him as such agent. The only remedy in such cases is by petition of right, or the remedy substituted by the Colonial Legislation. The various agents of the Crown can only enter into contracts within the scope of their authority, and therefore it is the duty for the subject who is the contractor to enquire whether the person proposing to contract on behalf of Government is the agent with authority, and is acting within the scope of his authority. An agent of the Crown as such cannot be sued on such a contract, either personally or in his official capacity, but if a Government agent contracts without authority, or expressly so as to render himself liable, he may be sued thereon. By 22 Geo. III., c. 45, and 41 Geo. III., c. 52, members of Parliament are prohibited from being interested in contracts for the public service on pain of being disqualified from sitting in Parliament and losing their seats, and being liable to a penalty. A petition of right will not lie against the Crown for tort in respect of the negligence of its servants, nor for a claim based on an alleged fraud imputing to the Crown the fraudulent misconduct of its servants, the remedy (if any) is against the actual wrongdoer.

CORPORATE BODIES.

Prima facie, all corporate bodies are bound by contracts under their common seal, but this *prima facie* power to contract cannot be insisted on as to matters where, from the nature of the corporate body, it is expressly or impliedly, by reasonable inference, prohibited from contracting. A contract as to such matters is *ultra vires*. It is the general rule that a corporation can make a contract only by writing under seal, with certain exceptions, which may generally be referred to three classes, viz.: contracts authorised to be made without seal by the particular purpose and constitution of the corporation; or upon the general ground of convenience and necessity; or, thirdly, contracts made on behalf of companies registered under the Companies' Acts, or incorporated under statutes sanctioning other forms of contracts. Contracts with local authorities for work and labour must be under seal in the following cases:—Contracts with municipal corporations for local improvements must be under seal in cases which do not fall within the Public Health Act, 1875. By Section 174, sub-s. (1), of the Public Health Act, 1875, "every contract made by an urban authority whereof the value or amount exceeds £50 shall be in writing, and sealed with the common seal of such authority." This section is obligatory, and not merely directory. The seal may be affixed at any time if there is a consideration for affixing it—for example, a promise to complete the contract. And it may be affixed by the local authority after an alteration in the original contract assented to. Even if the corporation has formerly sued upon and enforced the contract, it is not thereby debarred or stopped from setting up the want of sealing as a defence. Further, the absence

of a sealed contract, where requisite, may be set up as a defence against the corporation by the other party to the unsealed contract.

PAROL CONTRACT.

A builder covenanted with a corporation to do certain specified work for a sum of money, and that if their architects should require any alterations or additions in the progress of the work, the architect should give to the builder written instructions signed by them, and that he should not be considered as having authority for the same without such written instructions. The corporation covenanted to pay him the agreed sum, and the value of the additional work, if any. The plaintiff executed all the works to be done for the specified sum, and the architects required him to make certain additions, by means of written instructions, signed by them; and he executed all the additional works, and the corporation took possession of all the works. It was held that the plaintiff was not entitled to be paid on a *quantum meruit* in respect of the additional works, as the corporation was incapable of making a new contract by parol (*Lamprell v. Billericay Union*, 3 Ex. 283).—A railway company incorporated by Act of Parliament entered into an agreement, not under seal, with a contractor that he should execute certain works upon the railway for the purpose of changing the system of locomotion which they then employed to the ordinary locomotive principle. The contractor, in pursuance of the agreement, entered upon the works, and performed a portion of them, but before they were completed, he was dismissed by the company. It was held that he could not recover the value of this work (*Diggle v. London and Blackwall Railway Company*, 5 Ex. 442).

WARNING TO BUILDERS AND CONTRACTORS.

To architects, builders, and others dealing with companies and corporations, the following observations of Baron Martin in *Williams v. Chester and Holyhead Railway Company* (15 Jur. 829) are very important, and should be constantly borne in mind when it is intended to enter into building contracts:—"Persons dealing with these companies should always bear in mind that such companies are a corporation—a body essentially different from an ordinary partnership or firm, for all purposes of contracts, and especially in respect of evidence against them on legal trials, and should insist upon these contracts being by deed under the seal of the company or signed by the directors in the manner prescribed by Act of Parliament. There is no safety or security for anyone dealing with such a body upon any other footing. The same observation also applies in respect of any variation or alteration in a contract which has been made." A corporation is not bound to pay money upon any contract, though the contract is upon an executed consideration, even although they should adopt the contract, executory or executed, by resolution in their Common Council or by minutes in their books, if this contract is not made or ratified by the corporate seal. Part performance by a contractor will not validate a contract required by statute to be sealed or signed by the directors, and not so sealed or signed except in cases connected with the possession of land, where specific performances would be given.

THE exhibition, for the benefit of the Artists' General Benevolent Institution, which is to open next week at Messrs. Agnew's gallery in Old Bond Street, will have a very unusual importance. The pictures that will be shown are the decorations executed by Fragonard for Mme. Du Barry, a series of large canvases with an interesting history. The artist was unable to deliver them to his patron, whose power ended while the paintings were in progress, so they have remained until now at the house in the South of France, where he completed them, and have come direct from there to this country. The series, which is entitled "Roman d'Amour de la Jeunesse," consists of five great panels detailing various episodes in the story, and of certain overdoors and other decorative fillings; and it represents the work of Fragonard at his best.

BUILDING BY-LAWS.

A MOVEMENT FOR REFORM.

By A SPECIAL CORRESPONDENT.

A MATTER of considerable interest to the building public has been and is now engaging the attention of the Birmingham and other architectural associations. Difficulties having arisen in connection with the administration of the by-laws in some of the local districts, a sub-committee of the council of the Birmingham Association has been formed to consider complaints and approach the surveyors and district councils responsible for the framing and administration of by-laws with a view to securing more uniform and reasonable action. The existing by-laws for the city and surrounding districts reveal inconsistencies which would create surprise if they were fully known. As an instance, a set of plans may be deposited and passed as in accordance with the by-laws of one district which would be returned as quite

INCOMPATIBLE WITH THE REGULATIONS.

of an adjoining district, where the conditions under which the work would be done are precisely similar. It should be understood that all by-laws are based upon what are known as the "Model" by-laws, issued in 1875 by the Local Government Board, the authorities in the different districts being allowed to make variations in detail from these "Model" laws, and such variations, combined with local regulations under various Public Health and Administration Acts, and probably tinged with the individual opinion of the local surveyor, combine to bring about this confused state of things. In addition, it is held that the by-laws and regulations are not properly and equably administered, and that rules and requirements are attempted to be enforced which are not legally valid or necessary to secure either health or safety to individuals or communities. Moreover, in many cases such requirements add unreasonably to the cost of building. This is an important point in connection with houses for the working classes, because unnecessary outlay forces up the weekly rent, which has to be charged to secure a return on the capital expenditure. There is no desire on the part of those whose complaints have been considered

TO EVADE ANY REASONABLE REGULATIONS.

framed and administered with the intention of securing both health and safety. The difficulty, however, lies in the fact that there is no redress, because should a surveyor, supported by his council, attempt to enforce requirements which are practically unnecessary, and for which no legal by-law or regulation is in force, the Local Government Board, to whom such a question has lately been referred, reply that they cannot interfere on questions of administration. The Birmingham Architectural Association consider the matter to be one of great and increasing importance, and are anxious to ventilate it before the public whom it so closely concerns, and whose interest it is to see that inconsistencies are abolished and a more uniform state of affairs and administration secured. At a meeting held on Friday week the matter was freely discussed, and an intimation was read from the City Surveyor to the effect that when the proposed revision of the city by-laws was proceeded with, the draft would be referred to the Architectural Association for their suggestions. Several letters were also read from the surveyors of local districts which evinced a desire to act in conjunction with the Architectural Association. The committee would welcome any information and suggestions from building proprietors and the public generally.

NEWGATE GAOL.

A FAMOUS PRISON DOOMED.

SEEING that the career of Newgate Gaol as a prison is now virtually doomed, owing to the decision of the City Fathers to very nearly rebuild the grim establishment, a few particulars relating to the interior of the prison may be interesting. Many who have passed the black, grim, and stony walls, forbidding of aspect and heavy to a degree, of this City place of execution, which lowers in all its smoky and depressing grimness upon the busy life which surges in and around the busy street which gives the prison its name, possibly seldom or ever give a thought to the interior of the heavy building whose walls have witnessed the expiration of many a direful crime, but a ramble over its interior is vastly interesting. Armed with a letter of introduction to the Governor, the writer pulled up at the heavy wicket gate in the Old Bailey, and, pulling the bell, whose very clang was in strict keeping with its surroundings, was promptly waited on by a warder, and admitted with as much alacrity as if he had been a professional and compulsory visitor. The preliminaries settled, I was promptly turned over to the charge of a courteous warder, who had much to impart respecting the gaol. Taking the tour in its order, I first visited the exercise yard, where malefactors have one hour's exercise daily, this place affording the only glimpse of the sky that prisoners ever see, after which I was conducted to a series of wood and glass boxes, where prisoners are permitted to see their legal advisers, and thence to the compartment at the end, where those condemned to death have interviews with their relatives. I was next conducted to a large cupboard, wherein are kept the

PLASTER CASTS OF CRIMINALS

executed prior to 1861, leaving which I passed to another cupboard, wherein are preserved the irons from which Jack Sheppard slipped on his second escape from the gaol, in which he was fastened to the floor of his cell. These irons weighed half a hundredweight, and in the waist and round the ankles were lined with leather, and it was by cutting this with a nail that the desperado slipped his harness, and got free. Here are also preserved a set of leg shackles, lighter, and similar to those worn by the redoubtable Jack when he escaped on the first occasion in 1725, when he took the irons away with him. Handcuffs and leg irons of various descriptions are also kept here, as also an axe sent for the beheading of the Cato Street Conspirators, but which was never used. I was next taken to the kitchen, where in three large coppers the food is prepared, and then to the boiler house, and on to the cells, which are white-washed, with asphalt floors, and well-lighted by means of a ground-glass window at one end, and gas at night time at the other. Warm air is admitted over the doorway, the vitiated air passing away beneath the window, where also is a ventilator for cool air. I then gave a passing glance to the dark cells for refractory convicts, and then went on to the ward—one of the old ones—where the inmates were formerly herded together, and where the noble Mrs. Fry inaugurated her great and good work. Passing the old Press yard, where tortures were formerly inflicted, but which is now devoted to officers' quarters, I made my way to

THE CONDEMNED CELL,

which is double the size of the ordinary ones, and has running down its centre a plank bed and mattress, instead of the hammock, while it is provided with three stools (two for the warders and the other for the condemned), a shelf, which serves for a table, facing which is a picture of the crucified Saviour, while on the walls are two verses from the Scriptures, the rules of the prison, and two texts—one of which is, "God is Love." A similar cell is provided for women, but it is not kept in readiness, being utilised as a waiting room for female prisoners. I next proceeded to the prison chapel, which is the lightest and

cheeriest spot in the whole gaol. In front of the pulpit is a harmonium and a stove: the male prisoners are accommodated on "raked" forms on the ground floor, behind railings, the gallery being devoted to female convicts, who, by an arrangement of slanting partitions, can see the preacher only—nor can they be seen by anyone else from any part of the chapel. Facing, is a gallery for the Lord Mayor, and on the right of the pulpit the Governor's pew, and on the left that of the chief warder. Passing through the triple cage wherein persons under remand have interviews with their friends—a quarter of an hour daily—I went on to the gaol cemetery, wherein murderers sleep the long sleep of infamy and quicklime, which is a corridor connecting the Court-house with the gaol, and along which all prisoners have to pass after conviction. Here are interred a long array of criminals, whose whereabouts are denoted only by an initial scratched in the stone wall above the grave. Having traversed the place wherein murderers are interred, I was taken to their place of execution—not usually shown to visitors—which is really a room erected in a corner of the courtyard of the prison, free from observation, and only a few paces from the condemned cell. It is really a spacious apartment, capable of accommodating six malefactors at one time, the rope being fastened to a chain which is attached permanently to the cross beam, the lever, which releases the bolt supporting the trap, being similar to that employed for switching on railways. From the gallows level, a flight of steps leads to the pit below, which is constructed of brick, white-washed, and having an asphalt bottom. This concluded my wanderings through the prison, and having signed the visitors' book, I passed out through the iron spiked wicket, thankful to be once again in the busy hum of men. Altogether, I think it will be something to be thankful for when Newgate Gaol has a new face.

An Ancient Aberdeen Chapel Restored.

ST. MARY'S Chapel, the "lower church" of St. Nicholas, Aberdeen, has just been reopened after restoration. On account of its architectural merits and historical associations, the chapel is one of the most interesting in Aberdeen, and a long obscured adornment of the city has now been restored to its pristine beauty and impressiveness. The chapel consists of a nave, with north and south aisles, of one bay each, the nave being prolonged eastward by a semi-octagonal apse, from which it is separated by a strong, low, round arch. The chapel is vaulted throughout in stone, and is the only ancient example of ecclesiastical stone-vaulting in Aberdeenshire. Mr. A. Marshall Mackenzie, A.R.S.A., Mr. G. Gordon Jenkins, and Mr. William Kelly, three leading Aberdeen architects, are responsible for the present restoration. It was reported by the architects that it was fortunate public attention had been directed to the chapel, for dry rot had set in, and had even begun to infect the ancient carved oak, with which the chapel is so rich. In a very short time many of these unique and beautiful panels would have been hopelessly decayed. The earliest mention of the north aisle of the chapel is in 1445, when Andrew Cullen, afterwards Provost of Aberdeen, makes provision for an altar to be erected there—the altar, possibly, of the Holy Blood. The boss in the

ROOF OF THE SOUTH AISLE

points to a date still later, for it bears the arms of Alexander Chalmers, who was Provost in 1478. Prior to the Reformation the chapel was known, from the dedication of its chief altar, as "The Lower Church of our Lady of Piety." Before that altar many important documents of the Gordon family were solemnly signed and attested—among others the resignation of the bailiery of the lordship of Aboyne to the Earl of Huntly by the Adam Gordon of Aboyne who married the Countess of Sutherland, and brought that earldom also into the

possession of his house. After the Reformation the chapel passed through many vicissitudes. In the seventeenth century it was a prison for witches, and was called "The Pity Vault." An iron staple to which the prisoners were chained may yet be seen on one of the granite piers. When Bishop Pococke visited Aberdeen in the middle of the last century it was a plumber's shop; then it had more fitting use as the Gaelic Chapel; in 1818 it was the soup kitchen. When the old East Kirk, the ancient Choir of St. Nicholas, with its chapter-house, was taken down, St. Mary's was

FACED EXTERNALLY WITH GRANITE;

windows of the perpendicular style of the new church were inserted; and it was divided by two partitions into three apartments, to serve respectively as library, session-house, and vestry, for the East Church. At the same time, in 1837, it was fitted up with presses, seats, and wardrobes, made of carved oak from the old church. Among this oak are some fragments of the noble series of Gothic stalls, made in 1506, by John Fendour, wright in Aberdeen, for the Choir of St. Nicholas, and a great number of fine panels, dating from 1613 to 1706, which formed part of the pews and galleries of the old church, and are richly adorned with scroll work, floral carvings, and coats of arms. The heraldic interest of these is considerable, and as monuments of the art of the period are regarded as of great value. The first operation in the work of restoration was to take out the seating which had been made up out of the old gallery fronts and benches belonging to the old Church of St. Nicholas. The lath and plaster was cleaned off the walls and the vaulted ceiling, revealing

THE FINE STONE VAULTING,

with its moulded ribs rising from curiously-carved stone corbels, and marked at the intersection by beautiful bosses. An old wooden boss, of date about 1500, has been recoloured in distemper exactly as it had been originally. The removal of the lath and plaster from the west walls displayed some splendid vaulting, which adds six new spandrels to the roof. Two old staircases were discovered. These formerly led up to the choir of old St. Nicholas Church, and they have now been laid bare, so that a free examination can be had of the moulded doorways, in which are still to be seen the iron pivots on which the hinges swung. In its original state, the floors of the north and south transepts were at a higher level than the floor of the nave, and this arrangement has been reverted to, so that there is now 2ft. of difference, and a broad flight of four steps rises from the floor of the nave, as in ancient days, to the transepts on either side. The floor-level of the apse was also slightly raised. On the vaulted ceiling much labour was expended, and new stones had to be inserted from the bottom upward. One of the most important parts of the work, however, was the restoration of the bases of the four massive piers which are the main supports of the ceiling. The bases of the piers had been entirely hewn off in 1837, but new ones have been inserted. The floor of the transepts, as well as the nave, has been laid with granite, part of which was gifted by certain granite merchants in the city. Old flat tombstones which had been removed from their original sites on the rebuilding of the church in 1837 have been placed in the new floor,

THE ANCIENT CARVED WOODWORK,

dating partly from the beginning of the sixteenth and mostly belonging to the seventeenth century, and which, prior to the restoration, formed the benches, desks, &c., of St. Mary's Chapel, has been carefully preserved. Some of it has been used to form an oaken dado round the chapel, and a portion has been utilised to form a high wall-back to the pulpit at the west end of the nave. The wall-back is surmounted by a carved oak canopy over the long oaken seat. Another part has been used to form the front of the long pulpit-desk, a massive structure facing eastward towards the apse. On the raised floor in the apse stands the Communion table, which will also serve as a memorial of the illustrious Gordons who lie buried in the chapel.

A YEAR'S BUILDING IN GLASGOW.

THERE has been exceptional activity in the building trade at Glasgow during the last twelve months. In a review of the year's work, recently given at the Dean of Guild Court, the Lord Dean of Guild Graham said: Last September, in performing the same duty, I referred to the year that had then passed as one of exceptional activity, but this year has again outstripped it, 649 new linings having been granted at a valuation of £2,106,760, as against 676 linings valued at £1,851,005. Again, as in previous years, the great bulk of the work has been in one, two, and three-room tenements, the figures having been 855, 3367, and 856 respectively, as compared with 811, 2755, and 972 last year. But there has also been a marked increase in five and six rooms and larger houses, the figures having been 202 and 228, as compared with only 56 and 71, the average of the last ten years. In commenting on

WAREHOUSES AND SHOPS

last year I described the year as a record one, but this year has just beaten it with 136 linings, valued at £489,080, against 146 linings of valuation £486,490. One very noticeable feature in comparing the work of recent years has been the gradual increase in the average value of the linings passed. Ten years ago, taking an average of five years ending 1890, the value per lining was £1850. In the year under review it was £3240, as compared with last year £2740, and for the last five years £2400. The increase has been steady and continuous, the tendency having been to build larger ranges of tenements and larger warehouses. Last year, in order to show the progressive movement of Glasgow buildings, I went back for twenty-five years, dividing them, for the purpose of comparison, into quinquennial periods. Adopting the same plan again, and commencing with the period 1873-78, the amount of the linings passed was £7,606,776. This was the period of inflation so often referred to in discussing

GLASGOW'S PROGRESS,

and which, as we all know, was followed by one of depression and reaction. In 1897-98 the figures fell to £2,068,673, the lowest point having been touched in 1881. In the period 1884-88 the improvement continued, the figures reaching £2,255,619, and in the next period, 1889-93, it was still more marked, the figures rising to £3,982,940. But the last period, 1894-98, has been one of leaps and bounds, the total having been no less than £7,990,845, of which, as before mentioned, £2,106,760 belongs to the year just passed, the average of the past twenty-five years having been only £955,000. Perhaps, however, a more distinct idea of Glasgow's extension is conveyed to the mind by the length of new streets. The year just passed has been a record one in this matter, nearly six miles of new streets having been sanctioned by this Court. For the twenty-five years the mileage has been 41½, or an average of only two miles, but this includes the period of depression.

THE London County Council at last week's meeting were asked by the Technical Education Board to authorise an expenditure of £35,750 for the purchase of Oxford Mansions, Oxford Street, to provide permanent accommodation for the Board's Central School of Arts and Crafts. The school is at present housed in Regent Street, but, owing to the great increase of members, the building had become totally inadequate. There are 539 students on the books, and about 150 in daily attendance. Mr. Beachcroft moved an amendment declaring it to be inadvisable to place any permanent charge on the rates for the supply of technical education, such as was involved in this proposal, while it remained undecided what was to be the authority for secondary education, and that accordingly it be suggested to the Board that they should merely negotiate for the hire of any premises. After some discussion the amendment was adopted.

Professional Items.

CARDIFF.—The additions to Nazareth House, Cardiff, which have been in the course of execution for the past few months, are now approaching completion. The additions are situate to the east of the block, with which they are connected by an entrance hall and staircase. They abut upon Colum Road, from which thoroughfare they present a pleasing architectural feature. The additions consist of a block of buildings over 90ft. in length and 62ft. in height. The lower floor is devoted to sitting-rooms, dormitories, etc., while the whole of the upper part consists of a spacious chapel for the use of the inmates of the institution. The building is in the Early English style, in harmony with the older portion. The walling is of blue Pennant stone, with Bath stone dressings. It is connected with the old building by a staircase of patent stone, leading to a corridor. The whole of the upper portion of the new building is taken up with the chapel, which is 33ft. wide and 91ft. long. The capitals of the chancel arches are chastely carved. By the side of the choir is the entrance from the upper corridor from Nazareth House. The windows of the church, which are lancet shaped, are for the most part plainly glazed, but the south window is of stained glass. The roof is of the opened timbered kind, of pitch-pine. The floor of the corridor and halls of the lower part of the building are of tiles, and the other rooms are of pitch-pine. The floor of the nave of the chapel is of pitch-pine wood blocks, while the floor of the sanctuary is of oak. The woodwork of the interior of the chapel is stained in three different shades, and the general effect is excellent, an air of warmth and comfort being imparted. The ventilation is in the most approved style. The architect is Mr. E. W. M. Corbett, and the contractors are Messrs. W. Thomas and Company.

CROWBOROUGH.—The additions which have recently been completed at the Church of All Saints, Crowborough, were recently consecrated by the Lord Bishop of Chichester. The additions consisted of a new north aisle, with an organ chamber and vestry at either end, and the alterations give seating accommodation for another 150 persons. The same style of Architecture has been observed.

DUNDUM (Co. Tipperary).—The new Church of St. Brigid, Dunaskeagh, near Dundrum, is now approaching completion. The church is built of the local stone, with dressings of chiselled limestone. The exterior is simple, though dignified. The general treatment being a simple form of Romanesque. The church consists of nave, chancel, sacristy, and a south porch to the nave. The west-end of the church is surmounted by a tower which serves as a porch as well as a belfry. The nave is lighted by a pair of round arched windows and a circular rose window in the western gable, and by single lights to the side of the nave. The boundary between the nave and chancel is marked by a chancel arch. The roofs of nave and chancel are open-timbered to the ridge; they are of strong, ornamental character, suited to the general design of the church. On the exterior the roofs will be covered with Killaloe slates, the quiet gray-green tone of which will harmonise with the general colour of the walling. The architect is Mr. W. G. Doolin, M.A., of Dublin, and the contractor, Mr. John Bunyan, of Maryborough.

HUDDERSFIELD.—The old school of the Society of Friends, Paddock, Huddersfield, which was the original meeting-house, built in 1760, has been pulled down, and new premises have been erected on the site and land extending beyond. The total cost amounts to £1200. The work has been carried out from plans prepared by and under the superintendence of Mr. J. Berry, architect, 9, Queen Street, Huddersfield. The various works have been done by the following con-

tractors:—Masons, Messrs. A. and T. Haigh, Golcar; joiners, Messrs. H. Hollingworth and Son, Moldgreen; plumbers, Messrs. Sanderson Bros., Paddock; plasterers, Messrs. J. Robinson and Son, Marsh; painter, Mr. R. Heaton, Paddock; slater, Mr. Alfred Bower, Crosland Moor; concretor, Mr. John Cooke, Little Royd; heating engineer, Mr. J. W. Thornton, Fitzwilliam Street; electrician, Mr. T. W. Broad-bent, East Parade.

LEICESTER.—St. Hilda's new Chapel-of-Ease, Hunt's Cross, Leicester, of which Messrs. Grayson and Ould are the architects, is in the early English style, the material being terracotta brick, which, with the dark-green colour of the internal furnishing, gives all the elements of a complete chromatic harmony.

LEEDS.—A new infants' school in connection with Hunslet Carr Board School, the fifty-sixth school built by the Leeds Board, has been formally opened. Situated in Woodhouse Hill Road, on a site containing 3649 square yards, the new premises will accommodate 530 children. Mr. W. S. Braithwaite was the architect. On three sides of a central hall are class-rooms and on the fourth cloak-rooms. The total cost, including site, has been £6200.

A new bank has been erected in Park Row, Leeds, for Messrs. Wm. Williams Brown and Co. The block covers an area of nearly 100ft. by 80ft. The frontage to Park Row is 80ft., to Greek Street and Russell Street about 100ft. From the street level to a height of 26ft., the exterior is of polished grey Dalbeattie granite, relieved with courses and pillars of red granite. Above the granite, the structure is faced with glazed buff terra cotta. The pavilions rise to a height of 90ft. above the street. It will be observed that the entrance to the bank from Park Row is a handsome feature. Double sets of swing doors give admission to the bank, a large, lofty apartment, lined throughout with faience from the Burmantofts branch of the Leeds Fire Clay Company. The colour scheme of this embellishment is light buff, relieved with brown and blue, whilst the capitals of the pillars supporting the ceiling are picked out in gold. The managers' rooms are at the rear, and they also display some beautiful faience work. In the basement, covering an area of about 75ft. by 50ft., are the strong rooms, where the bullion, bank-books, etc., are stored. These have arches of firebrick, upon which rests solid concrete 4ft. in thickness. The floor is likewise of concrete. The bullion-room is lined throughout with hardened steel plates. One of these six chambers contains the bank ledgers for the past fifty years. A self-locking lift conveys the bullion, books, etc., from the bank to the strong rooms beneath when business for the day is over, and back to the bank in the morning. A large, well-lighted luncheon-room and other accommodation are provided for the staff in the basement. On the upper floors of the building are commodious suites of offices, some fifty rooms in all. The various contracts have been executed by the following:—Excavations and concrete foundations, Mr. S. Macfarlane; builders and joiners, Messrs. Armitage and Hodgson; smith's work, Messrs. John Butler and Co.; plumbing, Messrs. H. Braithwaite and Co.; plastering, Messrs. J. P. Mountain and Son; slating, Messrs. Watson and Warsnop; stairs, etc., Mr. Alfred Walker; painting, Messrs. Frederick Jackson and Co.; granite work, Messrs. Newall, Dalbeattie, N.B.; terra cotta, the Burmantofts Company; ivory-glazed bricks, the Farnley Iron Company, Limited; salt-glazed bricks for strong rooms, Messrs. Wm. Ingham and Sons; desks and fittings, Messrs. Marsh, Jones, and Cribb; ornamental ironwork, Messrs. Hart, Son, and Peard, London and Birmingham; wood-block flooring, Messrs. Illingworth and Co.; strong rooms, the Ratner Safe Company, London; passenger lift, Messrs. R. Waygood and Co., London; electric lighting, Messrs. Belshaw and Co., London; ventilators, Mr. W. Towler; heating apparatus, Messrs. Jefferies, London; and ironmongery, Mr. James Gibbons, Wolverhampton. Mr. Wm. Bruce was the clerk of works. Mr. A. Waterhouse, R.A., was architect

Under Discussion.

WHAT IS ARCHITECTURE?

The Edinburgh Architectural Society, on the 16th inst., heard a lecture by Mr. J. A. Morris, F.R.I.B.A., of Ayr. The lecture was an answer to the question "Architecture: What is it?" Mr. W. Nicholson Cumming, A.R.I.B.A., the President, was in the chair. Mr. Morris began with a strong plea for regarding Architecture as an Art and not as a Profession, and in this connection many modern influences were discussed. In spite of the evils of commercialism, he saw good reason for hope in the various art movements of the day. To show what Architecture should be, Mr. Morris then read those delightful passages from Vasari's "Lives" in which Brunelleschi's education and rise and the great competitions for the Duomo at Florence are so simply told. Indications were not wanting that the spirit of the Renaissance was once more awake among us, and considering all that had gone before, Mr. Morris ventured to think the future should be bright.

RECORD OF A SKETCHING TOUR.

A paper, by Mr. Austin Woodeson, Association Travelling Student, was read at the usual monthly meeting of the Glasgow Architectural Association, Mr. Geo. S. Hill, president, in the chair.—Mr. Andrew Rolls, in Mr. Woodeson's absence, read the paper, which was a description of a sketching tour of a fortnight's duration made by him last summer in Berkshire and the surrounding counties. The paper was illustrated fully, with about thirty-five drawings executed by Mr. Woodeson during his stay. The drawings, which showed buildings in Reading, Bray, Mapledurham, Abington, &c., comprised illustrations of churches, almshouses, &c. Many of the buildings were further illustrated by large scale details and measured drawings. Mr. Woodeson referred to the southern counties of England as offering to the architectural student an excellent sketching ground. All types of building, in styles ranging from Norman to Elizabethan, were to be constantly met with.

DECORATIVE STONEWORK.

At the third meeting of the Glasgow and West of Scotland Technical College Architectural Craftsman's Society for the season, a paper was given by Mr. Wm. Vickers, sculptor, on "Decorative Stonework as applied to Architecture." After dealing with the relationship of architect and craftsman, Mr. Vickers went on to speak of the education and ambition of the mason and carver. They must have a good education, so as to be able to intelligently interpret architect's drawings. The stone-carver should be possessed of some artistic taste. In his apprenticeship of five years, he should devote his spare time to studying at the Art schools, freehand, ornament, architectural drawing, modelling, etc. He should also know something of heraldry and Christian symbolism. A carver's study is never ended, even with forty years of practice. All carving should be appropriate to the architectural surroundings. It also should be second to the Architecture and should not be out of place on the building. In Gothic work, the mason and carver should work together in order to get the spirit of the old work. The lecturer then described the different forms of Classic, Renaissance, and Gothic ornament. He paid particular attention to the Gothic varieties. In Decorative work, he mentioned that the craftsmen of that period made their ornament as natural as it is possible for human hands to form. Perpendicular he described as truly wonderful, and pointed to the grand examples at Henry VII. Chapel at Westminster and the cloisters at Gloucester. In conclusion, he said that it is not every mason or student who could afford to travel, and he advocated that there should be in every large town a museum of casts, with a reference library in the same building, so that the craftsman can study these.

Correspondence.

CONTRACTORS' HORSES AND BEARING REINS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—May I, through the medium of your paper, address myself to the contractors, and ask them why they still continue the use of the bearing rein upon their horses? Veterinary surgeons unanimously condemn them as useless and mischievous. They cause much unnecessary suffering. They diminish the horse's power as well as its speed and action, and shorten its life. Many great firms have already abolished them. Mr. Fleming, Army Veterinary Surgeon, says:—"The long-continued pressure on the lower jaw tends to give the animal a hard mouth, it does not prevent stumbling, but, on the contrary, predisposes the horse to fall. In hot weather, or during extreme exertion, it may directly or indirectly produce an attack of giddiness or apoplexy, the last probably terminating in death. In heavy draught, in addition to the torture it occasions, it causes a large portion of the horse's power to be lost, from the animal being unable to get his head and neck down, and thus to throw more of the weight of his body into the collar. It causes pain and distress in breathing. It tends to produce distortion in the upper part of the windpipe, which causes difficulty in respiration, as well as the disagreeable wheezing, snoring, or whistling sound termed 'roaring,' and which constitutes an unsoundness." In the face of such evidence as this, endorsed as it is by the opinion of the whole veterinary world, there will surely be but few owners of valuable horses who will still persist in the use of a rein declared by unimpeachable authorities to be cruel, useless, and injurious.—I remain, dear Sir, yours faithfully,

J. W.

Enquiry Department.

WATER POWER.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Would you be so kind as to enlighten me, through the Enquiry Department of your valuable paper upon the following?—There is a cistern, fixed in a room, with an opening whose area is 1 square foot, which allows water to pass through with a velocity of 12½ ft. per second, the volume of water being 12½ cubic feet per second. What is the best article to use so as to get most power for driving a machine—should a water wheel, a turbine, or what be used? The cistern cannot be made larger or heightened. If you can tell me the best article to use, and also the horsepower it could be driven at by the supply of water named, I shall be greatly obliged,—Yours, &c.

A well-designed "over-shot" water-wheel is most suitable to this case. Turbines are usually made for heads of thirty or more feet of water, and in any case would be more costly than the wheel for this particular horse-power, which works out at 16 h.p. theoretically or 9½ h.p. actual, allowing an efficiency of 60 per cent. for a good wheel. The wheel should be fixed close up to the tank, have blades so shaped that they hold water for rather over the quarter of one revolution, and after leave the tail water freely. A good open tail-race should be provided.

A.M.INST. CIVIL ENGINEERS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Would you kindly oblige by letting me know where I can obtain all information re the examinations for the above Institute. Thanking you in anticipation,—Yours faithfully,

"ROADS."

The examinations are held in February and October annually. Application to enter for the February examination must be made before January 1st, and for the October examination before September 1st. For

Syllabus of Examinations and forms of application, you should write to the Secretary, The Inst. of Civil Engineers, Great George Street, Westminster, S.W.

LEADED LIGHTS IN WOOD CASEMENTS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Will you kindly give me a little information on the following subjects:—

I am having a small house built in half-timbered style, the lower story being in stone with casement windows in wood (on account of expense). Would it be right to put leaded lights to these wood casements and to the casements of the upper storey (iron casements being too expensive)? Do you know of any old houses having wood casements and leaded lights instead of the usual iron casements? Thanking you in anticipation.—I remain yours truly,

Cardiff.

H. H. T.

You would be following a general custom of modern architects of repute, in putting leaded lights into a wooden casement. The casement and frame look best painted white, with red brickwork, and some darker colour when used in walls of white or stock bricks, or stone. We know of no traditional mansions fitted in this way, but it was a common usage in the less assuming farmhouses, and in cottages and in many half-timbered houses. Be careful not to break up the glass in your wooden casements too much, and you will not be disappointed in the result.

FARM BUILDINGS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Could you give me the name and publisher of any book giving the plans, etc., and dealing with the requirements of farmhouses and outbuildings. If not, do you know of any book (not entirely upon the subject) or periodical, from which I may obtain knowledge of farm buildings.—Yours truly,

Burnley, Lancs,

"FARMSTEADS."

The following work has been adopted as the text book by the Surveyors' Institution:—"Farm Buildings: their Construction and Arrangement." By A. Dudley Clarke, F.S.I. Second edition, 6s. B. T. Batsford, 94, High Holborn, London.

GOTHIC ARCHITECTURE.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Will you kindly inform me the best book to study for the continuation of my studies in Gothic Architecture? Could you also tell me the price of Fergusson's "Handbook of Architecture"?—Yours, &c.

"PUPIL."

You do not tell us how far you have pursued your studies; but the following progressive list of standard books upon the subject of Gothic Architecture will include what you want:—"Glossary of Terms," Parker; "Principles of Gothic Ecclesiastical Architecture," Bloxham; "Styles of Architecture in England," Rickman; "Churches of the Middle Ages," Bowman and Crowther; "Architectural Parallels," Sharp; "Gothic Ornament," Collings; and Pugin's "Examples." Sir G. Scott's "Lectures," and G. E. Street's book on "Brickwork," are also valuable. The price of Fergusson's "Handbook," 2 vols., is three guineas. Batsford supplies it at £2 8s. net, or if you are lucky, you may get a good second-hand copy from him for a smaller sum.

With the object of preventing fires at places of entertainment where the cinematograph is being exhibited, a series of regulations have been drawn up by the Theatres and Music Halls Committee of the London County Council. These provide that no cinematograph or other similar apparatus shall be exhibited on premises licensed by the Council until the Council has been satisfied that all reasonable precautions have been taken against accident and danger to the public. The cinematograph shall stand in a suitable fireproof room which shall be entirely enclosed, the floors also being fireproof.

Views and Reviews.

GREENWOOD'S TIMBER CALCULATOR.

This is a useful little work which everyone connected with building should possess. Abolishing the older and more tedious method of cubing, &c., it provides tables from which the cost of the timber can easily be ascertained. There are also some useful rules for checking a timber merchant's invoice. Its simplicity and conciseness are its great merits.

"Greenwood's Timber Calculator."—1s. 3d., post free, of the author, J. Harry Greenwood, West Drive, Mansfield, Notts.

NOTES ON WATER SUPPLY.

Mr. J. T. Rodda has written and collected some very useful notes and memoranda connected with the questions of water supply. The book is designed to point out the specialists from whom valuable information may be obtained, and to indicate the best water works appliances now in the market and their usefulness in the modern distribution of water. The author has done a bold thing in including the advertisements of the various specialities he draws attention to, and one, we think, that will hardly prove beneficial to the work. The book should be very useful.

"Notes on Water Supply," by J. T. Rodda, Assoc. M. Inst. C.E., A.M.I. Mech. E., &c. 5s. King, Sell, and Ralston, Ltd.

HOUSE DRAINAGE.

So many books have been published dealing with house drainage—two, at least, under the identical title of the one under review, to the confusion of readers and publishers—that another seemed scarcely necessary. Mr. Jenkins, however, has succeeded in compressing information upon all essential points into so small a compass that his little work should meet with a ready sale. We should have preferred to have seen the illustrations better drawn, and it is a pity that compound drainage of terraces is advocated when separate drainage is compulsory in most parts of England, but, with these reservations, we welcome his attempt to bring a knowledge of the principles of his subject within the reach of all.

"House Drainage: Its Inspection and Testing," by Richard J. Jenkins. The St. Bride's Press Ltd., 24, Bride Lane, Fleet Street, E.C. 1s.

EMPLOYERS' LIABILITY.

In the preparation of the second edition of his exhaustive work on the Employers' Liability Act and the Workmen's Compensation Act, Mr. A. Robinson has had the valuable assistance of Mr. J. D. Stuart Sim, Assistant Registrar of Friendly Societies. As a result the book has been somewhat increased in bulk and usefulness by the addition of various Schemes of Compensation which have been certified by the Registrar of Friendly Societies, and of Rules that have been made under the Act of 1890. These have been added in the

form of appendices, and so do not affect the general scheme. Possibly the one of greatest interest to our readers will be Scheme X, relating to Portland cement manufacturing.

Employers' Liability Acts, Rules, and Certified Schemes, Second Edition. By Arthur Robinson, B.A., barrister-at-law, and J. D. Stuart Sim, B.A., barrister-at-law. Stevens & Sons, Ltd., 119 and 120, Chancery Lane, W.C. 7s. 6d.

HOW TO DRAW FROM MODELS.

It is difficult to know quite what one ought to say of this "practical manual" on "How to Draw from Models." The author in his preface states that "the object throughout this little book has mainly been to show how model drawing, as generally understood, may be an intelligent means of driving home those principles of foreshortening and grouping that must be grasped before a satisfactory sketch of any object can be made." It does this by appealing to the eye and to the test of practical experience, rather than by an appeal to the reasoning powers; indeed it might be said that it drives home facts rather than principles. It is a question whether such books ever justify their existence, although it is possible that this one will be found of service by beginners, as a help in analysing and understanding what the objects really are, which they propose to represent, and so, to some extent, teaching them to think. But yet one cannot but feel that the book savours too much of that unthinking routine and dependence on method, which is a weak spot in the Art teaching of this country.

"How to Draw from Models and Common Objects," by W. E. Sparkes. Cassell and Co. Limited, 1397.

PUMPS, THEIR PRINCIPLES AND CONSTRUCTION.

The author treats of the class of pump used by plumbers and other branches of the building trade. The ordinary jack pump is described in detail, the best methods of construction and erection are given, together with rules for calculating the power required to work the pump. Single, double, and treble barrel pumps are discussed, also wheel and chain pumps. The theory of the action of a pump in creating a partial vacuum into which the weight of the atmosphere forces the water, is very clearly explained, and the advantages attending the use of air vessels are also pointed out. The barometer and the syphon are both dealt with in a simple manner.

The various types of gearing used to operate pumps is described and illustrated, for the most part very well, but some passages in this

section, will, we think, be likely to lead the student astray.

Thus Fig. 39 illustrates a hand gear with fly wheel and handle and a rocking bar movement, and the author states that by its use there is a gain of power, but it is obvious that by shortening the throw of the crank, one would get the same reduced stroke of the pump rod that the rocking bar gives. The object of the rocking bar is to give an approximately vertical movement to the pump rod, it does not give any mechanical advantage, and there is no gain of power. Under the section "power for working pumps" the capstan is described and formulae given for working out the power required and obtained under given conditions. Various types of engines are spoken of that may be used to work pumps, and there is an excellent section on the water wheel, but windmill pumping apparatus is not mentioned. There are some useful tables relating to pumps and the duty they will perform, and the book contains a great deal of very useful information not only to the student, but to the practical man. Some of the illustrations, however, are not very good; we think that the drawings, in a book of this kind, should always indicate the actual practical method of construction. Hydraulic pressure, and other pumps used in the engineering trades, are not dealt with in this book.

"Pumps, their Principles and Construction." A series of Lectures delivered at the Regent Street Polytechnic. By J. Wright Clarke. B. F. Batsford, 91, High Holborn, W.C.

The funeral of Mr. Edmund Taylor, builder, of 46, Castlemore Street, Rochdale, took place, at Rochdale Cemetery on Thursday of last week. A native of Bridlington, Mr. Taylor removed to Manchester early in life, and eighteen years ago went to Rochdale, where he has resided ever since. As a builder he was the head of an extensive business. Many of the houses in the Freehold district were built by him, and he has also successfully carried out many important private contracts.

At a meeting of the Surrey County Council a discussion took place respecting the proposed rebuilding of Kew Bridge by the Surrey and Middlesex Councils. General regret was expressed that the amount of the lowest tender for the work and contingent expenses should be about £40,000 above the amount the two councils were authorised to borrow. It was decided, as far as Surrey was concerned, to accept the tender of Mr. Easton Gibb, of Skipton, Yorkshire, at a sum not exceeding £150,000, and that Parliament be asked to sanction a further loan.

James Catley ... 9,498
Alfred Reed and Son ... 9,418

WHITBY.—For additions to premises, Skinner-street, to convert them into five shops with a boarding house over them, for Mr. James Gray, J.P. Mr. E. H. Smales, architect, 5, Flowergate, Whitby:

Robinson Harland ... £4,733

Chas. Winterburn ... £3,445

John Braien, Silver-street, Whitby* ... 3,480
UXBRIDGE.—For erecting four cottages in Cowley-road:

Gregory Bros., Woking ... £385

CONTRACTS OPEN.

WEST HARTLEPOOL SCHOOL BOARD.

TO BUILDERS, CONTRACTORS, AND OTHERS.

Persons desiring to TENDER for the COMPLETE CONSTRUCTION of a BLOCK of SCHOOL BUILDINGS providing accommodation for 1502 children, Caretaker's House, &c., upon a plot of ground situate in Lister-street, Osburne-road, and Flaxton-street, West Hartlepool, can see the plans and specifications prepared by E. PERCY HINDE, Esq., Architect, Liverpool, upon application at the School Board Offices, Park-road, West Hartlepool, where bills of quantities can be obtained on payment of One Guinea, which will be returned on receipt of a bona fide Tender.

The person whose Tender is accepted will be required to pay the workmen employed by him the local standard or Union rate of wages.

Sealed Tenders, endorsed "Tender for Lister-street School," must be delivered to me on or before FRIDAY, the 2nd day of DECEMBER, 1898, at FIVE p.m.

The lowest or any Tender will not necessarily be accepted.

J. ROBSON SMITH,
School Board Offices, Clerk of the Board.
Park-road, West Hartlepool,
November 6th, 1898.

SHOREDITCH VESTRY.

TO BUILDERS, &c.
The Shoreditch Vestry invite TENDERS for CONSTRUCTING TEMPORARY FLOORINGS to the FIRST and SECOND-CLASS SWIMMING PONDS at the Baths Buildings, Pitfield-street, N. All particulars and bills of quantities may be obtained, and a plan inspected, at the Clerk's Office, Town Hall, Old-street, E.C., on payment of £1, which will be returned on receipt of a bona fide Tender.

Trade union rates of wages and hours must be observed. Tenders to be sent to the undersigned on or before FRIDAY, NOVEMBER 25th, 1898, endorsed "Tender for Temporary Floorings."

The Vestry do not bind themselves to accept the lowest or any Tender.

H. MANSFIELD ROBINSON,
Town Hall,
Old-street, E.C.,
November 10th, 1898.
Vestry Clerk.

THE Building Committee of the Carnarvon Cottage Hospital are prepared to receive PLANS, SPECIFICATIONS, and ESTIMATES for the erection of a new Hospital at a cost of from £2000 to £2500.

Accommodation will be required for a Male and Female Ward, also two small extra Wards (providing altogether twelve beds), Committee Room, Matron's Rooms, and an Operating Room, as well as the usual Domestic Offices. The plan should be so drawn as to provide for extension should occasion hereafter require. A premium of Ten Guineas will be paid to the Architect whose plans are accepted, and whose services the Committee reserve to themselves the right to retain or not. —For further particulars apply to MR. CHARLES A. JONES, Carnarvon.

COUNTY BOROUGH OF CROYDON.

LUNATIC ASYLUM, WARLINGHAM, SURREY.

ERECTOR OF BAILIFF'S HOUSE.
Notice is hereby given that the Council are prepared to receive TENDERS for the ERECTION of a BAILIFF'S HOUSE at Warlingham, Surrey.

Plans and specifications of what is required may be seen at the Borough Engineer's Office, Town Hall, Croydon, on and after the 23rd November, 1898, where also bills of quantities and particulars can be obtained on payment of a fee of Two Guineas, which sum will be returned on receipt of a bona fide Tender.

TENDERS to be sent to me by ELEVEN o'clock in the forenoon, on WEDNESDAY, the 30th NOVEMBER, 1898, endorsed "Tender for Bailiff's House, Lunatic Asylum."

The Council will not be bound to accept the lowest or any Tender.

By order,
E. MAWDESLEY,
Town Hall, Croydon,
November 14th, 1898.
Town Clerk.

THE GREAT NORTHERN RAILWAY COMPANY. STORES CONTRACTS.

The Directors are prepared to receive TENDERS for the SUPPLY of NEW and the PURCHASE of OLD STORES for Twelve Months from January 1st next.

A list of the contracts, and separate forms of Tender for each contract, may be obtained upon application to Mr. WEEKS, the Stores Superintendent, Doncaster, by whom every information will be furnished.

The stores must be in every case equal in quality to the Company's sealed samples and patterns, which will be exhibited in the Stores Department, Doncaster, where they may be inspected on application to the Stores Superintendent, from MONDAY, NOVEMBER 21st, to MONDAY DECEMBER 5th, inclusive, between TEN a.m. and FOUR p.m., and the contractors are requested to call and examine them before Tendering.

The Company's samples and patterns cannot be sent to contractors for inspection.

Tenders, addressed to the Stores Committee, marked on the outside with a description of the stores Tendered for, must be sent to the Company's Offices at King's Cross, in the envelopes specially provided, so as to be received not later than TEN o'clock a.m., on TUESDAY, DECEMBER 6th, 1898.

The Directors do not bind themselves to accept the lowest or any Tender.

WILLIAM LATTA, Secretary.
Secretary's Office,
King's Cross Station,

COUNTY BOROUGH OF CROYDON.

ERECTION OF NEW BUILDINGS AND ADDITIONS TO THE BOROUGH HOSPITAL AT WADDON.

Notice is hereby given that the Council are prepared to receive TENDERS for NEW BUILDINGS and ADDITIONS to this Hospital, consisting of a New Ward Pavilion and Additions to Administrative Block and Corridor.

Plans and specifications of what is required may be

seen at the Borough Engineer's Office, Town Hall, Croydon, where also bills of quantities and particulars can be obtained on payment of a fee of Five Pounds, which sum will be returned on receipt of a bona-fide Tender.

Tenders to be sent to me by ELEVEN o'clock in the forenoon on WEDNESDAY, DECEMBER 7th next, endorsed "Tender for Borough Hospital."

The Council will not be bound to accept the lowest or any Tender.

By order,
Town Hall, Croydon, E. MAWDESLEY,
November 14th, 1898. Town Clerk.

TO STEEL MERCHANTS and CONTRACTORS.

Contractors desirous of TENDERING for the STEEL FRAME CONSTRUCTION, about 650 tons, retaining Walls and Caisson Work of the New Buildings for the Dundee Courier, are requested to communicate at once, by letter, with Messrs NIVEN and WIGGLESWORTH, Architects, 34, Mecklenburgh-square, London, W.C., or 32, Bell-street, Dundee.

DORKING UNION.

TO BUILDERS AND CONTRACTORS.
The Board of Guardians for Dorking are proposing to ERECT a New WORKHOUSE INFIRMARY, adjoining the present Workhouse at Dorking.

The plans and specifications have been prepared by Mr. H. PERCY ADAMS, 28, Woburn-place, Russell-square, London, W.C., and, by giving him written notice, may be seen at his office.

All persons desiring to Tender for these works are requested to send in their names and addresses (from which several will be selected) to the undersigned on or before DECEMBER 1st, 1898, with the sum of Two Pounds in cash, which will be returned on receipt of a bona-fide Tender, or at once if the contractor is not one of those selected to Tender.

The Board will require the contractor to give security for the due performance of his contract.

By order,
GEORGE SCALES,
Clerk.

**INTRODUCTION OF NON-FLAMMABLE WOOD
INTO EUROPE.**

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to
Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"IOWA" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.
"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known
colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING,
(each of which is over eighteen stories high).

"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company
by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,
2, Army and Navy Mansions, Victoria Street, London, S.W.

Surveying and Sanitary Notes.

SOME startling disclosures were made at the October meeting of the Town Council at Yarmouth. The Local Government Board has recently written a letter of complaint as to the presence of fever cases in the town, and the medical officer of health has thereupon reported upon two "sample" districts in the town where fever outbreaks are constantly occurring, due, in his opinion, to the subsoil being saturated with sewage. He presented a report condemning twenty houses in these localities as unfit for human habitation, and was directed to report upon the other districts. —The borough surveyor told the Council there were 12,000 persons housed in the town, 30 per cent. of whom never saw the sun shine into their dwelling-rooms, while the majority of the remainder hardly get more than an hour's sun per day. The old thick walls of these houses were soaked with filth. The Corporation had permitted perfect warrens to be erected in which two people were housed where there was not room for one, the streets and yard spaces were insufficient, the houses were neither wind-tight or water-tight, and but for elaborate pumping measures they would be flooded with sewage three or four times a year. People were living under dirty, unwholesome conditions, which rendered the healthy support of human life impossible. To enforce all their powers stringently might be considered confiscation, but he said these properties had paid a large percentage for years, so that the owners would have nothing to complain of. —The medical officer of health supplemented this with the remark that it was impossible to proceed with the condemnation and demolition of houses until some healthy and wholesome places were prepared for the poor folk to go to. —The Council unanimously agreed to provide dwellings under the Housing of the Working Classes Act.

EARLY this year Dr. Sykes, Medical Officer of Health in St. Pancras, reported to his Vestry that in respect of the number of sanitary inspectors employed the parish compared unfavourably with other large districts in London. The Health Committee of the Vestry recommended the appointment of two additional inspectors, but their proposal was negatived. Thereupon the County Council directed Dr. Hamer to investigate the matter, and this gentleman reports that St. Pancras contains a larger number of persons living in tenements of one and two rooms than any other London sanitary district. He compares the results of this inspection with the results of similar inspections in Mile End Old Town, Whitechapel, and Lambeth, and points to the unfavourable position of St. Pancras with respect to the number of dirty, dilapidated, and overcrowded houses. Dr. Hamer lays stress on the need of maintaining a proper standard of house accommodation, and, as a means towards that end, of the regulation of the poorer houses let in lodgings. He found in St. Pancras, as he found elsewhere, that houses in which dirty and dilapidated conditions and overcrowding especially existed, occurred in groups, and were evidently associated with particular ownerships. For the purpose of maintaining the district in proper sanitary condition, he recommends the appointment of seven additional sanitary inspectors. Dr. Hamer's report has been forwarded by the Council to the Vestry, whose observations upon it are invited.

THE question of enlarging the refuse destructor at Aston, Birmingham, and of building a new destructor, has been discussed by the Health Committee of Aston District Council, and side by side with this the committee have considered the possibility of utilising the heat generated by the destructor either for the production of an electric supply for the whole district or for the works at Chester Street. At the present moment the minimum quantity of house and other refuse

to be dealt with by the destructor is about sixty tons per day of twenty-four hours, and which at times is increased to 120 tons per day. To meet this the committee contemplated laying down two additional pairs of cells as being the minimum means of dealing with the demands of the department, allowance being made for the growth of the district within the next few years. Thus, when the present destructor is repaired, and the new plant is laid down, the Council will have faced the difficulty of dust destruction for some years to come. In the ordinary use of the destructor considerable heat is developed, and it was a question whether this should be utilised in the production of electricity in sufficient quantity to light the district. On this point Mr. J. C. Vaudrey and Mr. George Garner, of Manchester, have been consulted. Mr. Vaudrey points out that the saving effected by using the destructor heat would be apparent only in the early stages of the supply, as on the demand becoming greater the dependence on coal will increase, and a point will be reached when the saving by the use of the destructors will be more or less lost sight of. Mr. Vaudrey does not, however, condemn the proposal to utilise the destructor heat for a smaller plant to be used in connection with the yard. Mr. Garner favours the whole scheme, but puts alternatives. The committee have decided to recommend the Council to provide a plant for lighting the buildings, yard, and fire station at Chester Street. The whole work of improving the present destructor, building new ones, and providing the electric plant is estimated to cost £11,500.

THE session of the Auctioneers' Institute was opened last week in the Lecture Hall, Chancery Lane. Mr. E. Dobson, the president, was in the chair. Mr. Alexander Macmorran, Q.C., read a paper on "The Effect of Recent Decisions on the Liabilities and Rights of Owners in Respect of the Drainage of Buildings." Under the Public Health Act, 1875, a drain might be said to consist of a channel for the conveyance of drainage or sewage from buildings within the same curtilage or enclosure in which a house stood. If a drain from neighbouring premises were let into it this channel would become a sewer. The duty of repairing a drain was upon the owner or occupier of the premises drained; a sewer, on the other hand, was vested in the local authority. It was a curious fact that, while a local authority had ample authority over private persons with reference to the making of drains from private houses, they had little or none in respect of the making of sewers except under private streets. To the general rule that a sewer became vested in a District Council there were three statutory exceptions—sewers made by a person or company for profit, sewers for land drainage or irrigation under a local Act, and sewers under the authority of Commissioners of Sewers. Where persons were damaged by floods caused by insufficiency of sewers and no negligence could be shown on the part of the local authority, they had no remedy, and could only complain to the Local Government Board. A unanimous vote of thanks was passed for the lecture, and in the discussion which followed a general opinion was expressed in favour of amendment and codification of the law in relation to drainage.

AT Sir Joseph Causton and Sons' New Printing Works in the Clapham Road, a 15in. internal diameter tube well has been sunk to the depth of 425ft. This tube well is all the more remarkable as the yield obtainable is 840,000 gallons per day, more than has as yet been obtained by any single well in any part of London. A novel and unique feature in this instance is the raising of the water, which is done by means of compressed air, entirely dispensing with all pumping and complicated machinery. Messrs. C. Isler and Co., London, were the engineers. As illustrating the dimensions of this remarkable well, it may be mentioned that if its circumference was sufficiently enlarged there would be ample accommodation, as far as depth is concerned, to afford comfortable burial to so lofty a building as St. Paul's Cathedral.

HOUSE DRAINS.

IS A FOUR-INCH PIPE LARGE ENOUGH?

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I have read with some interest your notes of Prof. Bostock Hill's paper in this week's journal, and I venture to call attention to some points therein raised in the hope of provoking further records of experiences from brother surveyors.

First, Prof. Hill expresses surprise that some surveyors should still insist on 6in. drains; I have been insisting on them myself, and the professor's arguments are not sufficiently crushing to convince me of my folly. He takes it for granted that the liquid passing through a 4in. pipe comes down in gushes, filling the pipe full bore—but does it?

I have frequently watched the discharges from domestic wastes when testing and examining drains, and have come to the conclusion that this is very seldom the case. The chief contributories in most houses will be the scullery sink, the bath, the roof, and the paved yard, and the flushing cisterns in the water-closets. None of these outlets are likely to exceed an 1½in. or 2in. diameter. How are these to fill even a 4in. pipe, full bore, unless three or four of them happen to be discharging at once? However violent any of them may be, they have first to encounter (the closet flush excepted) the check offered by a trapped gully; and even where there is no such check, I have noticed, as might be expected, that the discharge seldom fills the drain, even at its commencement, unless it "heads up" owing to a stoppage or a flat gradient, whilst the flushing and scouring power is dissipated long before the end of any ordinary length of drain is reached.

I have verified this by noting the flow through the manhole at the lowest point in the house drain, and I find here that the wetted perimeter represents a fraction only of the whole surface of the pipe, so that even where a scouring motion is produced at the top end, its effect is lost long before the bottom is reached, and so a great deal of suspended matter may be left to foul the surface of even a 4in. pipe.

I see that Professor Hill does not dispute the greater likelihood of a 4in. drain to get blocked. The housemaid's slop-pail contains articles at times which will readily jam themselves across a pipe of this diameter, forming the nucleus for an accretion of solid matter, and leading to a stoppage. If this real disadvantage is admitted, and if, as I have attempted to show, the advantages claimed for a 4in. pipe are somewhat mythical, then I hope Professor Hill will have a better opinion of those who still advocate 6in. pipes.

No doubt a great deal depends on gradient and direction as well as on the diameter of the pipe.

I regret he should take it for granted that an intercepting trap always contains a large amount of solid matter—undoubtedly many of them do, but defective shaping has something to do with this, and I believe it is possible to so vary the levels of inlet and outlet, as to make a self-cleansing syphon.

He also objects to the use of upcast shafts against buildings for the ventilation of the sewers, but I know of many such, which have taken the place of open road grids that have proved offensive, and which have never, in their turn, been complained of. They are all 6in. bore.

I cannot help thinking, however, that from a sanitary point of view this question of ventilation should be treated far more broadly than has yet been done. No distinction should be made between the public sewer in the street and the private drains branching from it; every intercepting trap, and the inlet vent-pipe just above it, should be abolished, and the whole should be designed, ventilated, and flushed as one system. There should be special access for flushing at the head of each sewer and of each drain, and the whole should be flushed by the local authority at regular intervals.—Yours faithfully,

WILLIAM L. T. BROWN, P.A.S.I.

Trade and Craft.

THE BLACKMAN VENTILATING CO. LTD.

The Blackman Ventilating Co. Ltd. have opened new showrooms and offices at 1, Colonnade Passage, Birmingham. This extension of business premises is the result of increasing business in the Midlands and the West. The firm's head office is at 63, Fore Street, London, E.C.

A BIG WARMING AND VENTILATING SCHEME.

The warming, ventilation, and hot water supply of Portrane Asylum, the largest building of its kind in Ireland, has received the most careful and lengthy consideration, so as to secure the best and most improved appliances. Leading engineers submitted schemes, and the plans and estimates of Messrs. John King, Limited, engineers, Liverpool, have been accepted for their Improved Mechanical System, employing their Rajah ventilating radiators, Rex air propellers, and patent tubular exhaust ventilators, involving a cost of nearly £20,000.

WEST HAM TECHNICAL INSTITUTE.

The Technical Institute and Public Library at West Ham, to which we referred a few weeks ago, has just been opened. This handsome new building has been designed by Messrs. Gibson and Russell, and has been erected and equipped at a total cost of £60,000. The chief librarian has introduced a number of special fittings and arrangements, several of which he has patented. The designs of all fittings and furniture were prepared by the architects of the building, and so as to obtain the best results in having the appliances of the most suitable kind, the Principal of the Institute was engaged and the heads of departments retained a considerable time ago to have the benefit of their advice and experience in this important matter. The fittings and furniture have been made by Messrs. James Garvie and Sons, Rose Street, Aberdeen; and of London. The contract amounted to about £6000. The fittings, benches, tables, &c., for the laboratories and workshops are made in deal, with teak-wood tops, but a large portion of the work is in polished hardwood, oak, walnut, and mahogany being the woods mostly used. The library fittings and furniture are all in these woods, and are richly moulded and carved. The glazing for the fittings, including the leaded glass panels in screens, as well as the staining and varnishing, has also been carried out by Messrs. Garvie and Sons, who do an extensive business with West End houses in London, and other parts of England, besides shipping to South Africa a large quantity of interior woodwork and furniture, a good part of which finds its way to Johannesburg and Pretoria.

THE INTERNATIONAL BUILDING TRADES EXHIBITION.

The International Building Trades Exhibition to be held in London in April and May of next year is already being anticipated with considerable interest. Exhibitors have, six months in front of the event, taken up practically the whole of the ground floor space and a sensible part of the galleries besides. This, and other tokens, promise that the exhibition of 1899 will be very big not only in size but in success. This exhibition, beyond doubt, holds up the mirror to building. Here we have passed in review all the latest devices and developments in all that pertains to the art in which the ancient Egyptians excelled; from the latest thing in mural decorations to the newest interceptor trap, the whole wide field of building enterprise is covered by the many exhibits which fill the spacious Agricultural Hall at Islington, and it must be readily ceded that the building trades owe gratitude to Mr. H. Greville Montgomery, the manager of the exhibition. Mr. Montgomery, in undertaking this enterprise, helps to keep those engaged in the many-sided building industry in touch

with their work, and it is satisfactory to note that the usefulness of the next venture is to be increased by the holding of conferences, on topics of professional interest, in connection with the various architectural associations, municipal engineers, and surveyors' institutes of the Kingdom. Another point of importance is that the exhibition will remain open for ten days—from Wednesday April 26th to Saturday, May 6th. The management has been wise in deciding on this extension in view of the popularity of the previous show. Exhibitors will appreciate the innovation—and it may be added here that the majority of those exhibiting last year are again down to appear, whilst many new representative firms have added their respective names to the list. Among these newcomers in the Clayworking Section are Messrs. Doulton and Co.; the Farnley Iron Co., Leeds; Gibbs and Canning, Tamworth; Howson and Sons, Staffs.; Hall and Boardman, Swadlincote; Oates and Green, Halifax; Stiff and Sons, Lambeth; Sankey and Sons, Bilston; Woodward and Co., Swadlincote; and Wedgwood and Co., Staffs. Intending exhibitors are advised by the management to apply early for the remaining space.

THE "CLIMAX" VENTILATING AND HEATING CO.

The "Climax" Ventilating and Heating Co., of 93, Hope Street, Glasgow, have just issued a supplementary price list, which illustrates many of the "Cousland" patents in ventilation. First of all, we are shown the "Cousland Improved Climax" Direct-Acting Louvre Ventilators. Experience and practical tests have shown these ventilators to be very reliable for free outlet of air in all currents, and in every state of the atmosphere, although liable to down-blow when the Louvres have not been properly arranged. The latest improvement, however, very effectively gets rid of this down-blow, thus removing the objection to a very useful ventilator. Next, we have the Direct-Acting Turret Ventilator, which it would seem has many advantages over the generality of automatic extract ventilators. The arrangement of the interior Louvres create a higher velocity than has hitherto been obtained, and, it is claimed, gives a larger area of outlet than any other ventilator of this class. An adaptation of this ventilator is the Direct-Acting Invisible Chimney Terminal Ventilator, which is intended for fixing into ventilating flues carried up adjacent to smoke flues. It is largely used in board schools throughout the country, it is inexpensively fixed, and being below the top of the chimney stack is not a disfigurement. This patent is also specially suited for the ventilation of mansion houses. The Direct-Acting Invisible Roof Ventilator is claimed to be the most perfect ventilator of its class. It is said that it gives a more powerful extracting force and larger area of outlet than has hitherto been obtained by any other invisible roof ventilator, and that its extracting powers have been proved equal to those of any turret ventilator from whatever direction the wind currents may be blowing. In a dead calm the exit area is double the area of the pipe; it can thus be depended on for a continuous outlet, while being fitted with automatic valves is free from down-draught. Altogether, this ventilator seems to be simple and effective; it is inexpensive and does not interfere with the architectural feature of a building. Ridge Ventilators, Continuous Exhaust Ventilators and Soil Pipe Ventilators, the Mica Flap Ventilator, Silk Flap Ventilator, Venetian ventilators, are all illustrated in this supplementary price list, which is a useful hand-sheet for the architect when dealing with ventilation.

The latest news regarding the Uganda railway is, on the whole, satisfactory. The gap or fault in the country on the line of railway has been explored, and turns out to be a broad valley stretching north and south for nearly three hundred miles. There is nothing for it but to take the railway down one side and up the other. Even on the way inland from the coast the gradients are perhaps steeper than any in Europe.

Builders' Notes.

MR. JUSTICE LAWRENCE and a special jury, sitting in the Queen's Bench Division, heard the case of Winfield v. Matthews, in which the plaintiff claimed compensation for very serious injuries suffered by him whilst walking along a public footpath.—The plaintiff, nineteen years of age, had for some five years worked as a plumber; and the defendant was a contractor who, in January last, was employed by the St. Pancras Vestry to put up certain columns or standards in connection with the electric lighting of the parish. On the 31st of the month, in the morning, the defendant's men were engaged in putting up one of these standards near the Canal Bridge, in the Chalk Farm Road. The standard was carried from the canal side upon a trolley, and kept in a perpendicular position by means of shears. The plaintiff was upon the pavement, and he and other people were watching what was being done, when the standard toppled over, and it struck the plaintiff's right foot, and so badly hurt it that most of the foot had to be cut away; and this injury, it was said, would to a great extent disqualify the plaintiff from pursuing his calling of a plumber. The case for the plaintiff was that if proper care had been taken by the defendant's men the accident would not have happened.

For the defence it was said that defendant had a policy of insurance against accidents, but the insurance company would not admit their liability in this case. When the column was brought to the hole into which it was to be placed it was found that the hole was not quite big enough, and so there was some delay. A tramcar came up, and the trolley was moved a short distance to be out of the way. In the course of this the standard "lopped," and it and the trolley went over together, and so the accident happened. It was part of the case for the defence that all due care was taken by the defendant's men, and that the people who were standing about to watch the operation were warned to keep out of the way, so as to avoid any danger that there might be. In the course of the case it was said that there was a question between the insurance company and the defendant, and that the latter took up a neutral position, and neither denied nor admitted his liability in this action.—The jury having heard the case through gave a verdict for the plaintiff, damages £300.

THE construction of the additional 180 miles of the Soudan Railway to Khartoum has been definitely decided upon, and the orders for the necessary bridges are being placed with British firms. Most of these bridges will be on the lattice girder principle, and all will be substantially constructed of wrought iron. The principal one will be that spanning the Atbara near its confluence with the Nile, and this will be over 1200ft. in length. There will be, in addition, between fifty and sixty smaller bridges, some of them spanning channels which are merely dry gullies at certain seasons of the year, but which have to be reckoned with in view of the periodical flooding of all water-courses connected with the Nile.

THE great Boundary Street scheme is still working its way out to its full development, and the end should soon be within measurable distance. It comprises twenty-two blocks of dwellings altogether, and of these fifteen are now finished and occupied. Three blocks are now approaching completion, two others are being just commenced and only two remain unstarted. Some of these later blocks, however, are among the largest of the whole undertaking, and until they are up the real magnitude of this County Council housing scheme will not be apparent. Altogether it will constitute quite a new neighbourhood, and will be far more extensive than some provincial towns. The Council never have any unlet, except a few four-roomed tenements for which there is less demand than for those with only two or three rooms. These smaller ones let as fast as they can be built.

THE CONSTRUCTION OF HOSPITALS

For Consumption and other Infectious Diseases.*

By Dr. JOHN W. HAYWARD.

HOSPITALS for consumption, being intended for invalids with an infectious lung and laryngeal (throat) disease, should be constructed with especial reference to atmospheric conditions; to sunshine; and to infection:—equability of warmth; abundance of sunshine; abundance of fresh air, and facility for supplying, warming, drying, and disinfecting the air, should be considered indispensable qualifications of hospitals for consumptives. These hospitals are not intended for the prevention of consumption, but for the treatment of consumptive patients.

Consumption hospitals should be built with all the precautions against infection that are deemed necessary in hospitals for other infectious diseases. It is of very great importance that the whole interior be made non-absorbent, and easily to be washed. All the floors, landings, stairs, and such-like portions should be of granolithic, and all the ceilings should be made as hard and as smooth as possible, and be well coated with good oil paint. All the walls should be lined with glazed bricks and tiles, as is the Liverpool Royal Infirmary, or enamelled slate slabs; and all breaking of their surface for the hanging of pictures, &c., should be absolutely forbidden, even in the nurses' rooms. All square corners

* "A paper read before the Liverpool Architectural Society on Nov. 7th, 1898.

HEALTH AND COMFORT IN HOUSE BUILDING, 3rd Edition, 1890.—E. and F. N. Spon, 125, Strand, London.

CONSUMPTION HOSPITAL

PLAN D

towards the south. This prospect should be reserved for the wards, for the sake of the sunshine.*

The best of all disinfectants and germicides, as well as of tonics and restoratives, being fresh air and sunshine, provision should be made for the admission into the wards and the whole hospital of as much of these as possible—abundance of fresh air without draughts, and of sunshine without scorching. To provide for this the hospital should be of the pavilion form—that is, in wings or blocks; and the free ends of these should be square to the south-south-west, so that both sides may be exposed to the sunshine every day. The pavilion form is advisable also for convenience and economy in the nursing; for ventilation, and for warming in cold weather.†

In order that the patients may not disturb one another by their coughing, each should have a separate ward. Several patients in the last stage of consumption in the same ward must have a very distressing and sleep-preventing effect on each other. Hospitals for consumption should therefore be composed of single, or (as a concession to companionship) some double, or treble, or at most quadruple, bed wards; and these should be placed along the two sides of corridors; in other words, each story of each pavilion of a consumption hospital should consist of a central corridor with wards along each side, as shown on the plans A.B.C.D. Wards along only one—the south—side of corridors ensures into them the midday's sunshine, and allows the corridors to be better lighted; but this arrangement requires more ground space than can generally be allowed, and is otherwise unadvisable.‡

In ordinary pavilion hospitals there is no central corridor; each wing has only one ward on each story, with beds and windows along each side. This plan certainly allows more sunshine to the patients, and may, perhaps, be best for large general, and for fever hospitals, but it renders warming very difficult; indeed, windows on both sides of large wards render efficient warming in winter almost

* Sunshine is very cheering and comforting to invalids; it is also a very effective promoter of their recovery, whilst its absence has a correspondingly depressing and deleterious effect. Abundance of sunlight is as necessary for the health and vigour of human beings as for those of flowers and fruit. Florists are so well aware of this fact that they are careful to always have their green-houses towards the midday sun. Physicians should be equally careful to have hospital wards similarly placed. Hospital wards, nurseries, and morning rooms placed to the north-east are a melancholy sight, and a reflection on the intelligence of architects and principals. Surely cheerfulness and healthfulness of living rooms are of much greater importance than the preservation of the colour of carpets and wall-papers! Besides, sunshine can easily be excluded from rooms that face the south by darkening blinds when necessary; but it cannot be allured into rooms to the north-east by any means whatever, however necessary or desired.

† There is a very exhaustive article on Hospital Construction in the last edition of the "Encyclopædia Britannica." It is based upon the best and latest information, experience, and arguments on the subject published up to the date of issue. After reviewing all the various forms of hospitals, the writer insists that the pavilion form should always be adopted; and he gives very sound reasons why it should. This form is also insisted on by all the best writers on the subject since, and was by many before that date. The quadrangular and cubical form interfere with efficient ventilation; and the crucial form makes it impossible to expose more than half the wards to the sunshine, the other half cannot have any direct sunshine from one year's end to the other. Circular wards involve so much outside wall as to render efficient warming difficult and costly. The writer in the "Encyclopædia" also insists that each patient shall have not less than 9 ft. by 12 ft. of ward floor space, with 12 ft. in height, so as to give him at the very least 1000 cubic feet of air-space; and that the air of this space shall be changed three times every hour; in other words, that there shall be supplied for each patient at least 1000 cubic feet of fresh air every twenty minutes, that is, 50 cubic feet every minute. Very similar provisions are insisted on by most other writers on hospital construction; by the Government Commissioners, with reference to military hospitals and barracks (see "Blue Book," pp. 92, 130); and by the authors of "Health and Comfort in House Building" (see p. 7, note).

‡ The space devoted to the central corridors is not wasted, for, besides serving as reservoirs of fresh air, they are convenient for many useful purposes, such as to place small tables on which to rest temporarily such articles as crockery, glasses, bottles, poultices; medicines, fruit, disks, and even foods, outside the wards. Here also may be placed couches for the very effective chest and lung expansion exercises of Dr. Percy Wilde, of Bath, explained and illustrated in the Monthly Homœopathic Review for October, 1897, p. 634.

impossible.* This plan serves very well in climates where the air is always sufficiently warm to be admitted directly into the wards through open windows, but it is very ill suited for climates like that of Great Britain, where during at least eight months in the year, the air has to be warmed before it can be admitted, at least in sufficient quantity to meet all the necessities of the ward, that is, for efficient ventilation.† Nor is cross ventilation necessary in our climate, for in summer open windows on one side of the ward will admit all the air required for ample ventilation, when there is perceptible movement of the outer air; and in

winter open windows cannot be borne, at any rate, in hospitals for consumptives.‡
(To be continued.)

* "From these experiments," say the Government Commissioners, "it is to be inferred that rooms where the cooling surface of glass is very large compared with their area can scarcely be habitable in cold weather."—Blue Book, p. 64.
† "Efficient ventilation" is supplying each patient with at least 20 cubic feet of fresh air every minute, and the same quantity for the nurse and for the gas light, besides 600 cubic feet for the fire; in other words, changing the whole of the air of the ward every twenty minutes. (See "Health and Comfort," pp. 7, 47, notes.)
‡ In the case of fever hospitals and large general hospitals it is perhaps well to do away with the central corridors and have windows to open on both sides of the ward for summer ventilation, and to make special provision for winter ventilation by having warming chambers of about 3 ft. wide and 6 ft. in height along inside the walls of the basement, with the primary inlets near the floor and the warming pipes near the ceiling, and conduct the warm air into the wards by somewhat flattened glazed earthenware flues, having for each patient an area equal to 15 in. square, up against the wall (not within it and terminating then either underneath the beds, not straight up the wall but bent along the floor about 18 in., or carrying them about 6 ft. up the wall of the ward, on the

The Housing Question Abroad.

THE housing problem is pretty much the same in every large city in every country. The Health Department of the Amsterdam municipality has just made an investigation into the condition of a thousand houses in a slum district in that city. It has found that 34 per cent. of the population live in tenements of one room with 3·4 inhabitants to the room. Just as in London, the smaller the accommodation the greater the number of people to a room. The report recommends the municipi-

pality to make a clearance of the whole area and to build healthy municipal dwellings, to be let at reasonable rents.

Tobin plan, with a valve or lid to regulate the supply, the terminal ends being covered with wire gratings to prevent the patients blocking them up. This plan of warming chambers along the wall is indeed being adopted in hospitals for consumptives, e.g., with central corridors, in addition to or substitution for the gratings in the corridor floors and the inlets through the corridor walls, providing the air is always kept warm enough before passing up the flues, and the corridors are otherwise sufficiently supplied with fresh warm air. Or a similar distribution of the air-warming pipes may be made on the inner side of the fresh air chambers, and the flues be run up against the corridor wall and terminated in the wards inside coils of the ward-warming pipes, in each instance the tubes being tapering and the terminal end and mouth easily closable. On some of the hot days in summer the atmosphere is so still that even with windows open on both sides of the ward little or no ventilation is effected. Open windows cannot cause the air to move either into or out of the ward: for these times only such provision as that advocated in the present essay, or some special mechanical power, can so move the air as to effect real ventilation.

Property and Land Sales.

To Contractors, Builders, Engineers, and Others.

MESSERS. FULLER, HORSEY, SONS, and CASSELL are instructed to SELL by AUCTION, Lots, at Bell-yard, Bell-road, Bromley, E., on **HURSDAY, DECEMBER 1st, 1898**, at Twelve precisely, **CONTRACTOR'S SURPLUS PLANT and MACHINERY**, including 18 h.p. portable engine, 7 ft. mortar mill, with vertical engine and boiler; mortar mill, with 7 ft. pan; 2 Chaplin's portable steam cranes, and power derrick crane, 10 crabs and winches, 15 iron ships, Sissons and White steam pile driver, 7 pile end wringing engines, 12 pile monkeys, double cylinder steam winch and vertical boiler, portable steam hoist, Gwynne's centrifugal pumps, 2 chain pumps, 3 pairs contractor's pumps, Blake's steam pump, Blake's steam crusher, Adie's cement tester, 12 one-yard end-tipped wagons, 10 trolleys and frames, 5 tons contractor's rails, 1 iron tanks, 6 portable offices, 6 large anchors, shear end pipe legs, iron blocks, 2 sand-washing machines, 25 iron wheels, girders, and ironwork, 150 loads useful lumber, 5 loads greenheart ends, 200 struts, 10,000 assorted bricks, large quantity stone, slates, tiles, &c., iron and wood sashes and doors, stone truck, spring cart, and other effects.

May be viewed the day preceding, and catalogues had at the Premises; and of the AUCTIONEERS, 11, Billiter-square, E.C.

AIRMILE PARK, near Cobham, Surrey.—A FREEHOLD BUILDING ESTATE of about 40 acres, with possession.

MESSERS. DRIVER and CO. have received instructions to offer to AUCTION at the MART, Tokenhouse-yard, Lothbury, NEXT SPRING (unless previously sold by private contract), the above property, situate in a favourite residential district, about a quarter of an hour's walk from the Oxshott and Fairlie Station, and about a mile and a half from Cobham Station. The estate comprises Building Land, ripe for development, the higher portion (sloping to the south) offering charming views over the intervening country to Epsom Downs; and a Residence known as "South edge," with stabling and garden; Eight small Villas, some Cottages, and the "Griffin" Beerhouse. On a portion of the estate brickearth is being worked, and all included in the sale as a "going concern." Particulars and plans, when ready, can be obtained of **HARLES JUPP, Esq.**, Solicitor, 48, Lime-street, E.C.; and of **Messrs. DRIVER and Co.**, 23, Pall Mall, S.W.

SURREY.—Choice BUILDING ESTATE.

—In a charming district, two miles from Horley Station (L.B. and S.C. Rly.) under one hour from London and adjoining a village where are church, shops, and post-office; two miles from Roman Catholic Church. FOR SALE, a compact and valuable FREEHOLD PROPERTY of 53 acres, with a frontage to the main Brighton road of 2000 ft., and perfectly ripe for development, with residences of a good class. Prettily timbered. Gas and water mains along the frontage. Would be divided.

Plans and full particulars of the owner's agents, **Messrs. GREEN and SIMES**, Auctioneers and Estate Agents, Blenheim Mansions, Queen Anne's-gate, London, S.W.; or **Mr. W. M. LEACH**, Auctioneer and Estate Agent, Crawley, Sussex.

CANNING TOWN, within five minutes' walk of Custom House Station.—A small Freehold Building Estate, comprising a little over six acres, ripe for immediate development.—With possession.

MESSERS. VENTOM, BULL, and COOPER are instructed to SELL by AUCTION, at the Mart, Tokenhouse-yard, on **TUESDAY, NOVEMBER 9th, 1898**, at TWO o'clock precisely, about SIX ACRES of valuable FREEHOLD BUILDING LAND, comprising the only uncovered land lying between Canning Town Station and the Recreation Ground, and possessing important frontages to the Freemasons and Prince Regent roads; title and land tax free.

Particulars may be had of **Messrs. HERBERT SAXELEY and Co.**, Solicitors, 7 and 8, Ironmonger-lane; at the Mart; and of the AUCTIONEERS, 35, Old Jewry, E.C.

Land Companies, Investors, Builders, Brickmakers, and Others.—ENFIELD TOWN.—Exceedingly choice FREEHOLD BUILDING ESTATE of upwards of 165 acres of exceptionally well-placed land, six minutes from Enfield Town Station (G.E.R.), ten miles from town, workmen's tickets being issued to the City at the low return fare of 2d., these facilities creating a very great demand for small property in the locality; its important situation, general contour, and extensive frontage of nearly 4000 ft. to Southbury-road (a principal main parish thoroughfare, lighted and sewered) adapt the property to an easy scheme of development, for which it is thoroughly ripe, and which could not fail to be highly remunerative; beds of gravel and sand, suitable for roads and building purposes, exist upon the property.

In addition to their building value, about 100 acres contain superior Brick Earth to considerable depths, which, with the special advantages which exist for rail and water carriage, afford exceptional opportunities for opening up brickfields. The Estate at present produces a rental of upwards of £600 per annum from two tenants, but early possession of the whole can be obtained.

Also 26½ acres rich FRUIT and MARKET GARDEN LAND, situate in Brick-lane, just off Enfield-highway with an entrance therefrom, and producing £115 10s. 6d. per annum.

his Land also contains Brick Earth.

MR. ALFRED RICHARDS is instructed to SELL the above by AUCTION at the Mart, E.C., on **WEDNESDAY, NOVEMBER 30th**, at TWO, Three Lots. Particulars, with plans, of **Messrs. TROWER, FREEING, and PARKIN**, Solicitors, 5, New-square, Lincoln's-in, W.C.; and of the AUCTIONEERS, 18, Finsbury-circus E.C., and at Tottenham.

ASSOCIATION OF DESIGNERS.

DESIGNS, WORKING DRAWINGS, PERSPECTIVES, ARCHITECTS, DECORATORS, & BUILDERS ASSISTED. INTERNAL DECORATIONS EXECUTED IN ALL STYLES.

BERMONDSEY (near the Tower Bridge).—FREEHOLD BUILDING SITES.

MESSERS. FIELD and SONS will SELL by AUCTION, at the Mart, on **FRIDAY, NOVEMBER 25th**, at TWO o'clock, in Lots, FREEHOLD BUILDING LAND, containing an area of about 14,000 ft., with frontages to Dockhead, London-street, and Mill-street, and suitable as a site for warehouses, manufactories, or artisans' dwellings.

Particulars of **Messrs. JOHNSONS, LONG, and Co.**, Solicitors, 9, New-square, Lincoln's Inn, W.C.; and at the Mart; and of the AUCTIONEERS, 54, Borough High-street, S.E., and 52, Chancery-lane.

MESSERS. CHURCHILL and SIMS next PUBLIC SALE will take place at the GREAT HALL, WINCHESTER HOUSE, Old Broad-street, E.C., On **WEDNESDAY, NOVEMBER 23rd, 1898**, at **TWELVE** o'clock precisely, with an assortment of DEALS, BATTENS, BOARDS, TIMBER, &c.

Catalogues of
CHURCHILL and SIMS, { Wood Brokers,
20, Clement's-lane, E.C.

STROUD GREEN.—59, Hanley-road, with possession. Substantial double-fronted RESIDENCE, stabling, and large grounds. Frontage about 77 ft., area 9250 square feet, affording an opportunity for the erection of additional houses, or would be a valuable site for flats or an institution.

MESSERS. J. M. DUNCAN and KIMPTON are instructed to SELL the above by AUCTION, at the Mart, Tokenhouse-yard, E.C., on **TUESDAY, NOVEMBER 29th**, at TWO o'clock.

Particulars, &c., of **JOHN FROST**, Solicitor, 150, Leadenhall-street, E.C., or of the AUCTIONEERS, 40 and 42, Queen Victoria-street, E.C.; and 5, Station-parade, Westcliff-on-Sea, Essex.

R. I. B. A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to **Mr. W. CHURCH HOWGATE, A.R.I.B.A.**, Perchard House, 70, Gower-street, W.C. (close to the British Museum).

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

R. I. B. A. SOCIETY of ARCHITECTS, and CIVIL SERVICE TECHNICAL EXAMINATIONS. Preparation by correspondence, in residence, or personally.—MIDDLETON and CARDEN, 19, Craven-street, Strand, W.C.

PLANS, SPECIFICATIONS, QUANTITIES, &c., carefully prepared by young Architect. Moderate terms to those about to build.—ARTISTIC, 1, West-terrace, Whitby.

QUANTITIES, Estimates, Measurement and Adjustment of Variations, Preparation of Accounts, and kindred work at strictly moderate charges by experienced man. Special terms Architects' work.—"Survey," 23, Kilburn Priory, Kilburn.

TO BUILDERS.—WANTED, some OLD OAK PANELLING, in good condition, suitable for carving upon.—Apply, **H. J. PASCOE**, Rugely, Staffs.

TO SHOP-FITTERS and BUILDERS.—Sketches of shop fronts, fittings, &c., artistically prepared by advertiser, who has had considerable experience with the leading shop-fitters in London. Terms extremely moderate.—PEDIMENT, Office of the BUILDERS' JOURNAL.

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

WANTED, first-class ARCHITECTURAL ASSISTANT, able to prepare working drawings from sketches, take off quantities, and prepare details. One who has had some experience in surveying and levelling preferred.—Apply, stating age, experience, and salary required, to Box 898, BUILDERS' JOURNAL.

JUNIOR ARCHITECTURAL DRAFTSMAN WANTED for estate and county surveyor's office.—Apply, with references and salary, to "LAND," Office of this paper.

WANTED, a thoroughly qualified ARCHITECT'S ASSISTANT. Must be able to help with quantities. Salary not exceeding £3 3s.—Reply, stating experience, forwarding specimens of work, to ARCHITECT, 102, Westborough, Scarborough.

ARCHITECT and SURVEYOR'S ASSISTANT.—WANTED at once, good draughtsman, able to level and make small surveys. Knowledge of specifications required.—Apply, in first instance, by letter only, enclosing references and stating salary required, to **Messrs. POWELL and Co.**, St. Swithun's Estate Offices, Lewes.

BUILDER or FOREMAN REQUIRED to ERECT a number of SEMI-DETACHED VILLAS at New Malden, Surrey. Liberal advances.—Box No. 896, BUILDERS' JOURNAL Office.

WANTED, Two TRAVELLERS with knowledge of trades, and buyers of sanitary pipes, all drainage fittings, white enamel ware, fire-bricks, &c. (A) To work Manchester district and East Lancashire; (B) to work Liverpool district, North Lancashire, Westmorland, and Cumberland. Must be steady, of good appearance, and have first-class references; state age and present employment, and salary required.—Apply, by letter only, to **A. MASON and Sons**, Horwich, near Bolton.

LONDON COUNTY COUNCIL.—JUNIOR ARCHITECTURAL ASSISTANT REQUIRED; student just completing articles preferred. Age between 18 and 23. Commencing salary, £1 11s. 6d. a week.—Forms of application can be obtained from the ARCHITECT TO THE COUNCIL (Housing Branch), 17, Pall-mall-east, S.W.

APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

YOUNG ARCHITECT, A.R.I.B.A., DESIRES to ASSIST others in the PREPARATION of DRAWINGS at his own office. **G. SCOREE**, 28, Newman-street, W.

ANSELL and MALLOWS, Architectural Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C.

WORKING FOREMAN of PAINTERS seeks RE-ENGAGEMENT; large London experience; good colourist and manager of men; town or country; good personal references; wages moderate.—"W. P.," 14, Ravensdon-street, Kennington Park.

YOUTH (17) seeks SITUATION in Surveyor's or Architect's Office. Knowledge of tracings and land quantities. Two years' experience.—**L. LAWRENCE**, 6, Broadway, Woking.

ARCHITECT and SURVEYOR'S JUNIOR ASSISTANT DISENGAGED. Levelling, surveying, good draughtsman, inking-in, colouring and tracing plans, &c. Usual office work. Good testimonials. Moderate salary.—**J. S. RAMSHAY**, Oundle, Northants.

ARCHITECT'S JUNIOR ASSISTANT (20) seeks RE-ENGAGEMENT. Neat and quick tracer. Shorthand (60). General office routine. Six years' experience.—**H. WITT**, care of **Messrs. Gibson and Russell**, 11, Gray's-inn-square, W.C.

ASSISTANT (Architect's) Disengaged. Used to infirmaries, hospitals, hotels, and domestic work. Practical and artistic draughtsman.—"Art," 4, Butler-street, Preston, Lancs.

An Architectural Causerie.

YEARS ago—many

The Art Amateur. years ago—the phrase “An Amateur of Art”

indicated a person, generally male, whose enthusiasm for Art and things connected with or dependent upon it led him to find pleasure in collecting beautiful objects, in subscribing for beautiful and expensive books, and so making their publication possible, in searching out young painters of promise, and assisting them with introductions, with advice, often with subsidies from his own pocket, in planning additions to his house to be carried out with the assistance of some architect, in a word, in furthering what he thought to be the interests of Art in every way. The meaning of the phrase is now so different that it is almost with a gasp that one realises how immensely circumstances have changed. The “Amateur” now publishes his own books with the intention of making money by them, he deals in pictures with the same intention, he (or she) is recognised by the Art worker as his bitterest competitor, and to this competition is largely due the great fall in the ordinary prices paid for good commercial work. Ladies and gentlemen who are not at all dependent upon the Profession for a livelihood are not ashamed to expose their productions at low prices side by side with those of the struggling artist whose living depends upon his sales, and triumph when their works happens to find purchasers, as they sometimes do—for the British public has no intuitions in Art matters. Young ladies who live in comfortable homes, where everything is provided for them, will offer black-and-white drawings to editors for nothing but the honour of having them published with their names attached. It is needless to point out what sort of welcome the next artist who brings work which has a price is likely to meet! Sometimes the halo of charity surrounds the amateur and her work (for she is generally of the fair sex), and then all her rich friends rush to give her commissions, and the unfortunate artist who only has to get his or her living loses another chance of doing so. The effect on the practice of Art is also disastrous. The amateur takes lessons, and learns such things as may be easily taught. That is to say, that he or she goes far enough to make a splash, and to assume that because it is easily learnt the practice of Art is an easy thing. The true difficulties do but begin beyond the point which he has reached, and he knows nothing of the exhausting toil and the sickening disappointments undergone by those who endeavour to produce great works of Art. But public opinion is largely formed from the dicta of the numerous amateurs who are supposed by their friends to know a great deal about it, and the result is a great over-appreciation of clever, tricky work; of the kind, that is, which the average amateur is

able to understand. Meanwhile, there is insufficient patronage for serious, carefully thought out designs, which demand for their full appreciation some time given to their consideration, some knowledge in the spectator, and some poetic feeling. There is another class of amateur to whom this article does not refer—those who have attained mastery over their materials by long and patient study, but who do not call themselves professional artists. They are artists, however, whatever they may call themselves, or be called. A. W.

“Four Walls and a Drain Pipe.”

IT was Mr. Ruskin who many years ago made use of this saying in contemptuous reference to the habit of according the title and dignity of “Architecture” to mere ful-

filments of the needs of shelter, light, and convenience in a dwelling; but if “four walls and a drain pipe” typified the popular and general conception of domestic Architecture with the Profession thirty years ago, the case is now much changed. To be applicable for the present day, the terms of the saying must be inverted. The concern of the ordinary working architect is now not so much exercised in the matter of four walls and a drain pipe, as in the need for some four drain pipes to every wall he builds. The sanitary engineer and sanitary manufacturer and fitter are becoming autocratic in their demands, and the architect, if he is to get up his building at all, must keep a watchful eye to his pipes. Already they have to be kept clearly in mind

OLD HOUSE AT LISIEUX. SKETCHED BY J. EDWIN FORBES.
Vide “ARCHITECTURAL IMPRESSIONS IN FRANCE.”

by him who would undertake to design in the domestic styles, and no practised judge who reviewed a set of working drawings would get very far in estimating the plans and elevation before the eternal subject of the pipes came to the fore, and pressed their claims to be regarded as a vital quantity in the design. Indeed, if things continue and develop upon their present lines, the elementary text books of Architecture which will be placed in the hands of our great grandchildren will open with the poignant enquiry, "What is Architecture?" and the answer written there will be, in effect, "Pipes." Styles may come and styles may go, but pipes, and the sanitary engineer, and his twin-self the sanitary manufacturer, threaten now to be always with us. They call at one's office, and conscientiously see to it that one uses none but the newest and most expensive materials and contrivances, for the chief attainment of the sanitary engineer, so far as one has been able to judge, is not that of the doctor who is concerned to cure our ills, but rather that of the bacteriologist who is chiefly exercised to discover new terrors and diseases. The sanitary engineer who can discover, and has the ingenuity to prove, that the lack of his new puff-pipe regulator, or patent musical warning valve, endangers the proper efficacy of a house drainage system, may be considered to have made his fortune. And woe betide the unfortunate architect who dares to overlook one small essential pipe. He may accidentally leave out the cornice on his main elevation, and no one will care; but let him leave out a single little tube that plays a part in the great scheme of the sanitary engineer, and he may have to disintegrate his Architecture in the cause of his pipes. One has seen just such a pipe on a rich and expensive elevation burst out through the brickwork under the corner of an abacus, crawl across the front, burrowing under obstructive pilasters and string-courses, and go bustling round the corner on its horrid errand; and everyone who has to carry out modern houses can call in mind the fearful ravages which a neglected pipe may commit upon a plan, and how often it must happen that the despotic demands of the drains has made a happy and adventitious scheme of planning untenable. It is hardly an exaggeration to say that the architect who has to avail himself of the latest science of pipes in a building, and who desires to attain a beautiful design, would do well to plan his pipes first as far as may be, and then clothe their skeleton framework with the flesh and substance—the bricks and woodwork—of the house. It will at least save him a quantity of vexations that will hamper the conviction and flexibility of his work, and relieve him from all chance of his design being in the end—and in spite of all his endeavour—disfigured by an unnamable pipe, as has often happened. One knows of a small church, or chapel-of-ease near London. It is a simple, restrained, uncostly design of a young architect of taste and skill, and relies for effect upon a fine tiled roof, and gables east and west. The climax of the design lies in the apices of these gables; and here, upon the eastern one, symbolically pointing to the heavens, is set a 3in. vent pipe, with bulged and split sides, rising so many feet above ridge as per the bye-laws, and leading away down under the moulded nib of the gable coping, to benefit the sanitary system of a very small vestry attached to this little church. The sanitary inspector would have it so. One considers Architecture to be an art, and always regard it consistently in that light, for it has consistently failed one as a Profession; and one would therefore here propose that we return again to the sanitary system of the last century as having less degenerative results than our own, taboo all pipes, and scrupulously throw everything out of windows.

B. C.

ON REFLECTION.

Pictures for Birmingham.

AN intelligent understanding of the significance of Architecture is such a rare accomplishment with the public, and an intelligent appreciation of its motives and aims is so rarely met with in general or ephemeral literature, that we heartily welcome and applaud an article lately published in the *Spectator*, which acknowledges the claims of Architecture as a Fine Art, and grants to it some adequate recognition of its indubitable worth as a prime factor in national education. Referring to Mr. Middlemore's munificent gift of pictures to the City of Birmingham, the *Spectator* says:—"We hope the casket will be worthy of the jewels, or, in other words, we trust the homage paid by Birmingham to the Art of painting will not be at the expense of the sister art of Architecture," and the writer goes on to refer to Architecture as the "Basic Art" or "Art of Arts," an admission we are glad to meet with in the domain of general literature, although the statement is not strictly accurate. We echo the *Spectator's* expression of hope that Birmingham will raise a fitting monument to the Art treasures which the liberality and enthusiasm of her benefactor have entrusted to her. Mr. Middlemore's collection of pictures is particularly rich in examples of Mr. Watt's Art, and includes some of his most famous paintings, and in making his gift to the city he has taken an attitude similar to that adopted by Mr. Tate in stipulating as a condition for the gift that a suitable gallery shall be erected to receive it. The consummation of Mr. Tate's munificence in the inauguration of the "National Gallery of British Art," including the site and the building, must be considered to have been a success, and we hope that Mr. Middlemore's liberality will meet with a no less happy recognition.

A Worcester "Competition."

IN the Worcester-shire Echo we find a naïve account of the process by which the Worcester Hop Market Guardians achieved the assessment of designs submitted in competition for the New Hop Market Hotel. We do not mean to suggest anything abnormal in the conduct of this competition; we rather regard it as a typical sample, the details of which are more precise and more accessible than is usual. The competition was confined to local architects, and on the assurance that the award of the assessor would be upheld, four firms submitted designs under mottoes, as is usual; and, as we believe is also usual, the real names of the authors of each design were generally known, and were even used by speakers, at a late special meeting of the Guardians convened to consider the plans, to indicate each design in preference to the distinctive motto. The assessors' award, approved by the "assistants," by which we understand the Building Committee, was laid before the meeting, and accordingly disapproved of. A leading figure in the debate was the Deputy Governor, who, having previously seconded the adoption of the assessors' award, now changed sides, and was eloquent in showing at once the superior merits of another design, and his own original lack of discernment. The meeting seemed to have unanimously accepted the latter plea, but viewed the former contention with distrust. One Guardian went so far as to suggest that the Deputy Governor had been posted in his arguments by the author of the design he favoured. Finally, without any reference to the assessor, and in direct opposition to the terms of the "conditions," the Guardians appointed themselves to assess the designs by ballot. The result was curious. The design numbered 3 was the assessor's

choice, that numbered 1 the deputy governor's protégé. Results of first ballot:—No. 1, 12 votes; No. 4, 8 votes; No. 3, 7 votes; No. 2, 2 votes. The result of a second ballot to decide the rival claims of Nos. 1 and 4 resulted thus:—No. 4, 17 votes; No. 1, 12 votes. Accordingly, the award has been made to No. 4—Messrs. Rowe and Son, of Worcester.

London Street Improvements.

SIR J. WOLFE BARRY'S suggestive address as chairman of the Council

of the Society of Arts upon the subject of street improvements in London, must have been read with considerable interest. The speaker, while insisting on the need for more and wider streets, and for practical means of facilitating London's traffic, did not lose sight of the need for a more deliberate aesthetic choice in the planning of our thoroughfares and open spaces, than has characterised such ventures hitherto. The question of how best to deal with the congested traffic in our streets becomes more pressing week by week, for it is an evil which fattens on itself; an intermittent freedom of passage for vehicles, reduces the rate at which they may travel, crowds the streets, and in turn occasions more blocks, resulting in further delays. Could the various vehicles travel equally at a fair rate without pause, a smaller equipment of streets than London now owns would serve all her ends, and it was in recognition of this fact that the London County Council lately issued suggestions to drivers of vans and market carts. Omnibuses have much to be held accountable for, and it is said that in Bond Street the four rival omnibus companies who ply there, occasion such confusion in the London season that people will not take their carriages there of an afternoon, and property in the street accordingly is threatened with permanent depreciation. Sir J. Wolfe Barry, we think, looks far into the future when he suggests that some conclusive method will have to be adopted to allow traffic passing north and south, to keep clear of that which is travelling east and west upon the great thoroughfares, and we think that his drastic suggestion of sinking one street below another will never be realised. It might become an object of serious consideration if the value of real property in London continued to increase to a great extent; but modern facilities of communication, and more perfect methods of locomotion, tend rather to equalise than to concentrate the value of London property.

London's Nuisances.

THE dearth of those events which make food for the daily press, has, during the past week, allowed opportunity to those useful members of the public who expend energy and enthusiasm in reminding us of the many imperfections of the conventional life of our great cities. Thus we find *The Times* liberally granting its columns to correspondents who are oppressed with the evils of London smoke nuisance. It would be interesting to know whether these crusaders against the smoke nuisance have ever thought to abate the nuisance of their own fires, by reconstructing their chimneys or burning anthracite, which are the two simplest ways of overcoming the evil. Lord Middleton's letter seems to us to greatly exaggerate the evils of London smoke when he describes it as killing flowers and shrubs at Wimbledon, and inflicting misery on the poorer classes of the community to whom "it often means loss of work" (!). The poorer classes of the community are mainly sufferers by their own smoke, and it seems to us that their lot in life would not be lightened if they were compelled to the expense of using "self-consuming" fireplaces, or allowed to burn nothing but anthracite.

ARCHITECTURAL IMPRESSIONS IN FRANCE.*

NOTES ON A HOLIDAY TOUR.

By J. EDWIN FORBES.

ONE'S first impressions of the Continent, or rather such part of the Continent as Dieppe constitutes, are rather interesting. As the train crawls through the streets of the town one gets an idea of what it is—a regular seaport town, but the striking thing is the amount of colour in everything.

Dieppe passed, we go on through the best scenery in Normandy. Instead of the corn-fields one has been accustomed to, there are orchards everywhere. The farmhouses with their steep red-tile roofs and half-timber work, and the tall poplar trees which surround them, give individuality to this part, and, in fact, to all Normandy.

At last Rouen comes in sight, lying in the great valley of the Seine. The clearness of the air over this city is very noticeable, and, with all its church spires, one gets the general effect of this town to great advantage from the carriage window. As one passes out of the station at Rouen into the town's broad streets of Modern architecture with its electric cars, one is rather disappointed. But proceed into the heart of the town, into its old squares, its courtyards, and its smelling alleys, and you will be satisfied with the colour, the details, and the materials.

There is a very interesting colony of half-timber work houses in the north part of the town. Down the side of the streets here runs an open sewer, once a burn; this necessitates every house on the one side of the street having a bridge to its door; the houses projecting one story beyond another, make very picturesque groups.

The town is full of Gothic work. The

* A paper read before the Edinburgh Architectural Society.

Church of St. Ouen is both externally and internally the finest church I have ever seen. It exhibits in its plan the French peculiarity in its choir and chapels, more perfectly than in most. It is Early Fourteenth Century in style, the best period of French Gothic. The unusually lofty triforium is exceedingly beautiful. All the windows are filled with stained glass, the reds and blues of which are specially fine. The graceful and light effect produced in the interior is largely due to the absence of constructional ornamentation. Where carving and figures occur, they are very spirited and full of feeling. The sculptors of this period were more skilful than their predecessors, and their carving shows more delicacy and finish, while the statues are no longer idealities.

The tower of this church is very interesting. Flanked by graceful turrets, it is surmounted by an octagonal open work lantern, the total height being about 270ft.

The Cathedral of Rouen is uninterest-

ing, especially after St. Ouen. It is very unsymmetrical on plan. The Tour de Beurre, the loftier and more interesting of the two over the west façade, was built from the money paid for indulgences to eat butter in the time of Lent. There is a piece of atrocious work here. The beautiful central tower has been surmounted with a high iron spire, all open work. It is horribly ugly, and it entirely takes away the romance and sentiment of the place to see an iron spire, which will be passed down to future generations as a monument of nineteenth century art. The interior calls for no special comment.

There is church after church which one might comment on, were not Rouen so well known. There are churches which have been turned into factories, coach-building works, and even joiners' shops, but we will leave them.

Before leaving the town, however, let us look at the Palais de Justice, which is a fine adaptation of Gothic Architecture to civil purposes. I cannot do better than quote Dawson Turner. He says, referring to the exterior elevations: "The windows in the body of the building take flattened elliptic heads, and they are divided by one mullion and one transome. The mouldings are highly wrought, and enriched with foliage. The lucarne or dormer windows are of different design, and form the most characteristic feature

PALAIS DE JUSTICE, ROUEN. DRAWN BY ARNOLD MITCHELL.

of the front. They are pointed and enriched with mullion and tracery, and are placed within triple canopies of nearly the same form, flanked by square pillars terminating in tall crocketed pinnacles, some of them fronted with open arches crowned with statues. The roof, as is usual in French and Flemish buildings of this date, is of a very high pitch, and harmonises well with the proportions of the building. An oriel or rather short tower of enriched workmanship projects into the courtyard, and varies the elevation."

The whole is a magnificent pile, such as leaves the pleasantest memories. The richness of the ornament is such that no other example of domestic Gothic can vie with it, except, perhaps, the Hotel de Bourgheroulde, in the Place de la Pucelle of the same city. In some respects this wonderful building is more elaborate in ornamentation and abundance of sculpture than the Palais de Justice.

The entire front is divided up with six slender pilasters and small cornices or string courses, accentuating sill or floor lines, the spaces between being filled up with bassirilievi; every inch of space on which a historic scene can be sculptured has been taken up. This building has in consequence not the same dignity as the Palais de Justice.

There is no city in France better fitted for study and easier got at than Rouen. It strikes one as a large museum, every building having some special interest, and yet quite different in detail from the building next to it. It is a place one should go to and stay at for months, not days. The whole impression points to the artistic life of the fourteenth and fifteenth centuries, when every building, however simple, was in itself a study of good proportion and artistic treatment.

But we must take leave of this city and journey on to Lisieux. It was night when we arrived at the oldest-fashioned town imaginable. As the hotel omnibus rumbled through the narrow winding streets, we got glimpses of the

STAIRS TO ORGAN: S. MACLOU, ROUEN.
DRAWN BY ARNOLD MITCHELL.

timber-framed houses, all of which made us weary for the morning's ramble, when we would be able thoroughly to satisfy our awakened curiosity. At last we got jolted into the old-fashioned courtyard of the hotel, where we were most luxuriously put up.

Here in this quaintest of towns, with its quainter inhabitants, we lived and moved for eleven days. The unconventionality of the place and people were delightful. The only town that in any way approaches it in this country is Chester, but even Chester falls far short of it. I am sure there is no such street anywhere like the Rue aux Fèvres. In this street, as in most others, but this one especially, each story projects so much that the inhabitants on the upper floors might easily shake hands across the intervening space.

The construction of the timber work is

herring bone pattern. The plaster infilling is three-fourths composed of cow manure and short cut straw.

The colour on these buildings is splendid; the timber uprights are often left in their natural condition, and have toned to a dark brown. The plaster work, the general tone of which is a yellowish green, has in some places taken tints of red, even as light as vermilion, while in others on into dark browns and greens.

The Church of St. Pierre has a splendid position in the large square of the town, with the old Renaissance prison on one side, and all around, timber houses whose gables try to outstretch its neighbour. The church is built in the Early French style—one might nearly call it Early English. It is simple and refined, with massive towers on the west end, one of which has a fine crocketed spire. The stone

restoring part of it, and had the whole façade scaffolded, which was too good a chance to lose.

There is a great variety of class of work in Caen—good Norman and Gothic; while in the back streets, Domestic work, both in stone and timber, the former very simple, well-proportioned, and in good preservation.

The two churches founded by William the Conqueror and his Queen are in opposite extremities of the town—the Abbaye aux Hommes, and the Abbaye aux Dames. The Conqueror's church is pure Norman; the effect is noble and imposing, with all the usual Norman details. There are some fine Roman capitals, otherwise it calls for no special comment. The Abbaye aux Dames is naturally very much more interesting; it was founded in 1066. The west front is very interesting. It has very good doorways, and also two rich

Bishops Palace

Rouen

Aug 1898

SKETCHED BY G. SALWAY NICOL.

worthy of notice. The whole building often rests on a stone-moulded base, say, about 2ft. high; on this is a deep wooden sill of oak (as is all the timber), on it are fixed upright angle posts, 8in. to 10in. square, the intermediate upright posts being as small in some cases as 7½in., but they vary greatly. On the top of these uprights is a wooden sill, on which the wooden corbels project, and they, strange to say, in many cases go right through to the back of the house, and also serve as floor posts. There are pieces put between these corbels on the front elevation, with great covette mouldings, which give splendid effect of light and shade. The sill courses to the windows are rudely moulded, and grotesque carving often appears either at the end of corbels or over the doorway, and this construction is repeated on each story, terminated by a steeply pitched tile roof. There are two alternatives for the infilling—plaster or bricks—the bricks in the very old houses being about 10in. by 1in., with a ¾in. mortar joint; they are either laid on diagonally or in

of which it is built, curiously enough, has caught the infection and weathered a greenish hue. Internally it is so simple one might almost be tempted to call it bald, but the proportion and simple detailing redeem it.

Our next stopping place was Caen, distant an hour by train. Ridges of limestone, separated by wide flats of rich meadow, characterise that part of Normandy in which Caen is situated. Old Caen was placed on one of these ridges, but modern Caen has gradually spread over the lower ground, and is a large, clean town, almost entirely built of stone, having inexhaustible quarries in its immediate vicinity. I may mention in passing that the easiest way of visiting Caen and its neighbourhood is to sail direct from Southampton, which takes one into the centre of interest without the tiresome railway journeys which are so characteristic of France.

Our visit here was a short one, and most of it was taken up in measuring the façade of the Hotel D'Ecoville, which is one of the best examples of French Renaissance. They were

Norman towers, with a Transitional tower over the transepts. In the interior the embattled frette is carried round the arches of the nave. It is a splendid interior. There is a most delightful church opposite which has been made into a carpenter's shop, with a very rich doorway. The building that really takes one's breath away is the Church of St. Pierre. It is in the centre of the town. With a most beautiful tower and spire, it is another masterpiece, like St. Ouen at Rouen, of the graceful style which prevailed in the beginning of the fourteenth century. The spire is pierced, and is surrounded by eight small turrets. It is one of the most complete churches we came across, with a touch of Renaissance about its later additions which makes it all the more interesting. Inside one can sit for hours studying the detail. There are some nice Renaissance tablets in the chapels which cluster round the east end. One would like a fortnight in this church alone.

(To be continued.)

Dalle des Procureurs.

ARE ARCHITECTS' ASSISTANTS UNDERPAID?

To the Editor of THE BUILDERS' JOURNAL.

SIR.—I have read with some amount of interest and approval the correspondence on the above question.

It is my candid opinion that architects' assistants are a great deal underpaid, when we consider the rapid strides the labouring classes have made in regard to wages and hours.

What is £2 2s. or even £3 3s. for an architect's assistant in comparison? Why, even the bricklayer will average his £2 and £3 per week, and have the privilege of smoking his pipe all day, and his employer dare not say anything to him or "I'll pick up my tools and go." A salary of £3 3s. per week is not satisfactory when we know there are hundreds of builders' foremen getting far more. In my opinion our salaries ought to increase according to the mechanics', and thus keep us on a higher footing. Hours, too, are the same as with the working-man, viz., eight hours.

The working-man gets time-and-a-half for overtime, but very few architects' assistants get paid anything for their overtime.

Building is getting more expensive, owing to independence of workmen. Of course, this means more commission for our employers, therefore they are able to increase our salaries if they wish. I sincerely hope some prominent member of R.I.B.A. (or otherwise) could introduce some scheme to shorten our hours and increase our salary which may satisfy discontented assistants.—Yours, &c.,

"BE-SQUARE."

THE SOCIETY OF ARCHITECTS.

PRESIDENTIAL ADDRESS.*

By MR. WALTER EMDEN, J.P.

THE work which this Society has always set itself to do, is that of being of practical assistance to its members and the Profession in general. Any subject which will benefit the Profession or the public, and which lies within the scope of the work of a professional society, will always receive earnest consideration and attention.

The way in which this Society has dealt with the question of registration of architects, is a proof of its determination to persevere with its work in the face of many difficulties, and I feel sure this Council will not be found less persevering or less ready to labour for the accomplishment of any other of the Society's aims.

During the past year, as was told us in the report, the Society has made some progress with this question of registration, and indeed, slow as the process of education in this direction may seem, there is no doubt an Act will eventually be passed for the protection of the public, by the procuring of properly qualified architects.

Voluntary examination may be all very well in its way, but there should be in all professions where the lives and pockets of the public are so much at its mercy as they are in building operations, no volunteering about the qualification, but an absolute certainty that the qualification has been obtained by the necessary examinations being passed.

* Delivered at St. James' Hall, Piccadilly, W., on Thursday, Nov. 24th, 1898.

CHURCH OF ST. VINCENT, ROUEN: WEST PORTAL. SKETCHED BY G. SALWAY NICOL.

OLD HOUSE, RUE CONDORCET, LISIEUX. SKETCHED BY J. EDWIN FORBES.

The Council have instituted, and trust it will grow during the course of this coming year, a bureau for the employment of clerks, so that those requiring clerks, and clerks requiring appointments, can have an easy channel of communication, and with the advantage that those requiring appointments by passing through the books of the society, will show that some enquiry as to their capabilities has been made.

It is also proposed (and the last Council has already given a large amount of consideration to the subject), to establish under the Society's control a system of tests. In this present age when invention has been making such vast strides, and every year sees large numbers of improvements and patents of all kinds added to the list, it seems to us, a very useful purpose will be served if some thorough and independent tests were from time to time, obtainable with regard to their value and serviceability. While it would encourage the inventor it would, at the same time, prove a considerable source of benefit to the public by their having confidence in its use.

The great difficulty in dealing with improvements is sifting out the good from the bad, and the usual process through which the public have to go is an extremely expensive one. They have indeed to buy their experience. They purchase and use what may, and often indeed, proves afterwards to have little or no value, and by such expensive experiences are discouraged from taking any further risk, and thus leave much which might in their work or business prove a valuable economy untouched.

Set out in the Society's journal of September are some of the ways in which such a system of tests could be of service to the public, to the professional man, and to the inventor.

The tests, however, would not be limited to new inventions. There are constantly new materials coming into the market which have their special attractions in price or manufacture, and which, at the same time, being untried, want of experience prevents being freely used.

RIGHTS OF LIGHT AND AIR.

Another practical work, and that of the first importance, which is being undertaken by the Society, is that of bringing about some change in the law which (without affecting the rights of property) shall prevent the vast waste of time and money which there is every year in negotiating and litigating over questions of light and air.

Every architect and surveyor knows well the annoyance which his client and he also is put to when proposing to erect buildings in any

town. It is no exaggeration to say that in some cases a building which may greatly improve the surrounding property by its being erected, is attacked on all sides by questions of light and air, and that a crop of ten or a dozen cases may be raised against it, often, many of them, of the most trivial nature; and it must be an especially lucky building owner who commences and completes his building without any such claim being made.

Almost all of these cases arise from the uncertainty as to what does or does not really affect the rights of an adjoining owner and what can legally be held to materially affect it, and beyond this I am afraid it is only truth to say that the desire of gain largely affects the claims made. Not only professional costs, but the larger gains contained in the question of whether, rather than have his building stayed by an injunction, and risk the large amounts necessary to fight an action on nothing more than trivial rights or even imaginary ones, the building owner will not pay a sum of money or blackmail.

If we look for an instant at what has to be faced by a building owner, it will be seen at once that it must often enough curtail building enterprise, as does the state of uncertainty seriously impede those who legitimately wish to rebuild or improve their premises.

Everyone seems to think that a building owner is fair game for compensation.

It is only natural that each surveyor should desire to look first at his client's interest and desire to do well for him, and necessarily in dealing with the business in hand they do not trust the other side to look after their clients; and the state of uncertainty as to what are, or what are not a client's exact rights under the law as it stands, all tend to prevent a settlement and produce a law suit.

The same affects the solicitors when they come on the scene and consequently not only do the professional costs get piled up by the law's uncertainty and one man will get through where another is stopped, but a law suit becomes almost inevitable.

In order therefore to protect the interests of a client an injunction is obtained, and I fail to see that the architect or solicitors can be blamed if, in their client's interests, they obtain an injunction where the case may be of a trivial character, if they think their client is likely to obtain a monetary benefit by so doing, which may even be larger than the real value of the damage.

These cases, too, depend so much on technicalities, while the necessity to bring home to judge and jury the facts as they are, is so great, that models and numberless plans have to be prepared, and experts at expensive rates

called in order to prove fully the views of each side to those who have to try and decide the case.

What wonder is it then, that these cases become enormously expensive, and that thousands of pounds are every year more or less wasted in costs on them? This very expense is the opportunity of the man with rights great and small, to obtain from the building owner a sum of money, rightly or as a blackmail matters not so long as it is paid; as at all events it leaves the building owner better off than to try the case with its attendant risks and costs.

I venture to think that no enquiry into this subject could be made, without disclosing not only the great number of these actions, but their wasteful cost.

I am sure, in the eyes of every honourable professional man, it is necessary to avoid this useless waste of money; and he would desire to prevent the class of case being set up which so often assumes the aspect of blackmail.

The Council of this Society has set itself to work to make a determined effort in the direction of preventing this useless waste, which affects not only the public, but the honour of professional men.

There is no doubt the question is a difficult one to deal with when first approached, because it is not desirable that people's vested interests and rights of property should be interfered with; but it seems to me that the object which we have in view can be obtained without any such interference, and yet justly and effectively prevent the waste which has been and is a growing evil in England.

In Scotland, the Court of the Dean of Guilds deals with these questions, and the canny Scot is saved the annoyance and expense; and, conservative as we may be in England, there can surely be no reason why we should not adopt some similar or suitable means to accomplish the same end here. The Building Act Tribunal which, in dealing with Building Act cases in London has shown that there can be no difficulty in appointing a Technical Court to deal with these matters; and the payment of its cost would be the merest fraction of the costs to which building owners are now put.

The secret of this wasteful and improper system lies, like all other wasteful systems, in the uncertainty of the extent and value of the rights affected, and until these can be decided before commencing to build by an independent decision from a Court to which it is compulsory to go as in Scotland instead of stopping the building in the middle, the waste and impropriety of the present system will grow and scandalise our ability as businesslike and honourable men.

The suggestion which I would make and which I think this Society should adopt, is that a technical court under the London County Council in London should be established, and every building owner should be compelled to deposit a full set of the plans of any new building or material alteration of a building with the central authority paying some such fee to cover the expense of dealing with them, as may be deemed necessary, and that the authority should then require the owner to give notice to all the adjoining owners who may be affected, so that if after examining the plans they think there is interference with their rights of light and air or other easements, then the tribunal after seeing that all interested had had notice should proceed to hear the objectors and the building owner, and after hearing, decide as to what height, &c., the building can be carried without interference with the lights and easements of the objectors.

The fact that such a decision is given before building operations are commenced, and before the building owner is pledged to his contract with his builder, would of itself be a substantial boon apart from the great saving of time and money, and apart also from the saving made by its being an absolute preventive of blackmailing by factious and petty cases being raised and the fighting of expensive actions.

I fail to see that anyone could suffer injury by this course, and the good arising from it must undoubtedly prove a valuable incentive to

OLD HOUSES, RUE DES TANNEURS, LISIEUX. SKETCHED BY J. EDWIN FORBES.

the public and professional men alike in the numerous building operations which in this great city are constantly necessary.

There is no doubt that when cases are carried on, men's feelings and men's judgments get involved and warped, and cases are carried in consequence to such lengths that thousands are spent on small and petty matters, which in themselves, taken at the very largest valuation, would not represent more than a very small portion of the costs which are incurred.

I in no way wish to pledge myself or the Society to the details or the exact methods by which this beneficial change should be brought about, but I suggest what must appeal to all as advisable, and simple means, such as an extension of the powers of the Building Act Tribunal in London, by which to accomplish it. The fees charged could be made to cover all the expense of the Court and its attendant officers, and would then be moderate enough to prove a mere drop in the ocean, compared to the present wasteful process. Future discussion on this subject may devise better means, but anyway it is, in my opinion, and I trust it is the opinion of all those to whom I speak, necessary that the settlement of this subject should not be longer delayed, and that the remedy should be applied at an early date.

The Society have presented a petition to the Lord Chancellor, and I have also laid before the London County Council a notice of motion for the Building Act Committee to consider this important question, and I hope for the hearty and substantial support of the whole of the Society.

The only difficulty is that the question does not appeal directly to the great body of the public who, though they may suffer in certain ways, only suffer occasionally and for the most part indirectly, but those who build and have built will, I am sure, feel the force and necessity for the remedy which we advocate, and I trust they will use also their endeavours to bring it about.

I trust, too, that the efforts of leading men in the professions of both architect and surveyor, as well as those of the legal profession, will not be wanting in the necessary effort to bring about a reform so greatly needed, and which will once and for all sweep on one side the exaggeration of claims of a petty and improper character, with all the attendant waste of clients' money which comes in its train.

THE LOCAL AUTHORITIES.

I would like to say a word or two on this

subject, more particularly as applied to London. There is in London much overlapping of authorities, and a multiplication of applications totally unnecessary for the protection of the public, and, indeed, tending rather to befog it, and to leave loopholes.

A valuable reform might be made in this direction, and perhaps when we have the New Municipalities Bill of the Government this might find a place.

A simple reform could be made by extending in the Council's hands, their powers as a Court of Appeal, with power also for the making of rules and regulations, but place entirely (except as to the necessary inspecting officers to check the local authority) the administration of such rules and regulations, and the passing of plans in the hands of the district or local authorities. Let the district surveyor also be the surveyor of the local authority. Let there be but one surveyor, with a competent staff in each division of the County of London, and only one administrative authority, the local or divisional one to pass the plans of buildings, both as to structure and sanitation, and indeed for all purposes.

Appeals from the decisions of the local authority could then well and properly lie with the London County Council as the central and head authority. Now, not only have plans to be passed through several authorities, but there is the absurdity of the London County Council having appeals against itself, a course, which in my opinion, good as has undoubtedly been its work, is calculated in the long run to lower its authority, and prevent that public confidence which there should be in its decisions.

THE STATE OF SANITARY WORK.

There is another subject, vast in its proportions, and far-reaching in its effects upon the health of the public, which requires urgent attention.

No one can fail to know that in the smaller towns and in the provinces very little inspection goes on, and houses are drained and allowed to keep or use appliances of a most dangerous class, a fact which not only keeps up, but spreads disease to an extent which many will hardly believe. Every year brings its crop of cases of typhoid and other diseases caught in country houses and country towns of the smaller class.

The remedy lies in the law enforcing a strict uniformity of requirements adapted to town and country buildings, with a regular and full

inspection, and with power to enforce requirements.

We are told to leave the town and go to the country for health, but I venture to say that the health statistics will show London and other large cities, taken as a whole, have a less death rate than many a country town and many a country district.

It cannot be said the large towns are perfect; indeed, they are far from it, and must so continue while the apparatus and system approved in one district are disapproved in the next (merely across the road), and while this uncertainty and confusion exist, this imperfect state will not decrease but will probably increase.

The remedy is simple, let the battle of systems be fought out before some competent and independent authority, appointed by the Local Government Board, and then let us have uniformity.

There is no reason by so doing to discourage improvement, but rather to encourage it, as the same authority could and, in my opinion, should have power to examine, at the instance of any Sanitary Authority, any suggested improvement and to certify it as suitable for use.

Of course, the system for London, or in large towns, cannot be the same as for a country district; but there are equally good systems of drainage for country houses as for London houses, all that is necessary is that their use shall be defined and enforced.

We cannot but hope that this important question will not be left until some terrible epidemic brings it home to those who at present neglect and sleep over it.

LONDON IMPROVEMENTS.

There is still one subject more I would like to call attention to; it has been claiming some attention lately, and is of serious importance to the good working of this vast city.

Sir J. Wolfe Barry, in his address to the Society of Arts, suggested great improvements in the thoroughfares of London. I do not question the need for the great and growing necessity for widening main thoroughfares, but I fear that before the authorities have the courage or, possibly, the inclination, to spend such vast sums as the proposals he makes will cost, the necessity will become unbearable. No doubt, with our present knowledge, we could lay out a city on much better lines than those on which London at present exist (though there is much to be said for the picturesque

and quaint appearance of many of our streets), but it is and would be too costly to try the means suggested, and the disturbance of trade centres and existing business premises would affect in a very detrimental manner the occupiers and the ratability of the district through which the improvements were carried.

It seems, therefore, that we must meet the growing want and present pressure by some less costly method. No doubt, we must press on the widening of some of the various great thoroughfares where feasible; no one will suggest that where the cost is such as the community can reasonably bear, that there should not be further and well considered improvements, but it is clear these will not meet the pressure. The increasing traffic caused by those who work in and whose business brings them in increasing thousands to this great city must be met, and we must, therefore, examine into other means for meeting the difficulty, within the power of the ratepayers' pocket.

It is, no doubt, a fair question to ask: "Are we, because great new streets are too costly, to sit still?"

It is some years ago since I first suggested subways for London to prevent the great inconvenience to traffic and business by the constant upheaval of the road surface for the laying and repairing of pipes, wires, and drains.

My suggestion went so far as to propose that the whole width of the roadway should be a subway, which could be well used for and would amply accommodate not only all the pipes and wires, but would also leave good broad ways for pedestrians, and, if it should be necessary, for bicyclists too.

The advantage of subways in saving the road surface is great. The benefit to companies for water, gas, or electric, in the facility for examining, testing, and attending to their pipes and wires must be evident and would in my opinion, prove such a saving as to make the rent to the authorities well worth paying. Thus not only could a very much increased traffic be covered by the same roadway, with its subway under, but an outlay of much less capital would be required, with considerable prospect of some return by rents. There would be much less disturbance to business, there would be no goodwill of business, or leaseholders' or freeholders' interests to pay for; indeed, the land would be obtained without cost, while the cost of the subways being almost entirely that of building, the expenditure would give employment to the great numbers of workers who live in this city, and who spend their earnings in it, and thus those who had to find the cost would obtain some return benefit from its expenditure. I must conclude, however, and content myself with what has been already said, in the hope that some of these great and pressing questions of reform which are before us may commend themselves to those whose duty it is to take note of public opinion and public necessities.

A TWO-STORIED house, No. 19, North Crescent Mews, Burton Crescent, King's Cross, has collapsed owing to the shorings giving way. The front of the house fell into the road.

The new buildings of the London Library in St. James's Square will be formally opened on Monday, December 5th. The buildings have been built by Messrs. Cubitt, and the architect is Mr. J. Osborne Smith.

A CORRESPONDENT writes:—"The bust recently purchased by the Russian Ambassador at Madrid—the Christ with blue eyes—is pronounced by experts to be the work either of Donatello or Michael Angelo. The discovery has created a sensation in the world of Art. A photograph was sent to Her Majesty Queen Victoria, who has expressed a wish to have it copied."

THE Colonel North Memorial Hall and the Plasnewydd Higher Standards Schools, Maestag, which have recently been opened, are warmed and ventilated throughout by means of Shorland's Patent Manchester Grates. The buildings have been erected from the designs and under the supervision of Mr. E. W. Burnett, architect, of Tondy, near Bridgend.

BUILDING REGULATIONS

IN TOWN AND COUNTRY.

THE interesting controversy in the Times on the subject of building by-laws in town and country still continues. Mr. W. Wykes-Finch, in a recent letter, supplies considerable food for reflection. He says:—"I not only agree with your correspondents that 'the building by-laws cause unnecessary expense and inconvenience in rural districts,' but I unhesitatingly assert that if such laws are not restricted in their operation to places and areas of an urban character very serious mischief will arise. Rural district councils have no authority under any Act of Parliament to pass by-laws. Before they can move in the matter applications must be made to the Local Government Board for urban powers. But the same section—viz., 276—in the Public Health Act of 1875 which allows this application allows also the same privilege to the 'persons' of every 'contributory place' whose assessment to the poor is not less than one-tenth of the total assessment of that contributory place; so that every parish and every separately rated area can, with a facility as great as that of a rural district council, obtain urban powers for its own better government. And, this being so, I am strongly of opinion that 'urban powers' should in no case be granted to a rural district council until it has satisfied the Local Government Board that some contributory place of an urban character, within its district, persistently refuses to ask for urban powers. I go even further than this, and say that the

GRAVE RESPONSIBILITY OF PASSING BUILDING BY-LAWS

at all should not be placed in the hands of such small and inexperienced bodies as are rural district councils. They should be framed by an expert committee of the House of Commons, submitted to that House for discussion and approval, then administered by officials independent of local prejudice and local favouritism. But in no case should they be in force outside urban districts, unless the new buildings are within, say, 30ft. of a neighbour's boundary. I do not write without experience. I have been for many years a member of the Kidderminster Board of Guardians, and, since the Act of 1894, a member of the Rural District Council. This Council has recently adopted building by-laws for the whole district, of the most drastic nature, without one line read or section discussed! though in the agricultural parishes a new building is a very uncommon sight. Indeed, owners of property in the country have scarcely money wherewith to do common repairs. To illustrate the absurdity and

OFFENSIVENESS OF THESE BY-LAWS,

let me say that my house stands quite alone, surrounded by my own fields. There is no one within half a mile, and yet, if I build, I should be subjected to the same espionage, the same dictation, the same rules and regulations, the same penalties, the same interference with freedom of action as if I were erecting a new building in the most crowded part of Kidderminster! Than this, it is difficult to conceive a more offensive invasion of a man's reasonable liberties. And not only so, but the operation of these building by-laws in rural districts will be disastrous to the interests of the working classes. I could give the names of owners of large estates who absolutely refuse to build, or rebuild, under such conditions. I know of very many who are determined to follow the same course. Self-respect demands it. Old cottages, not worth repairing, will be pulled down, but not rebuilt, and the erection of new cottages will be stopped. The cost of building in the country is considerably greater than in the town, though the rent in the town is three times that in the country. Under these by-laws this condition of things will be much aggravated. The cost will be increased 25 per cent. Thus the agricultural districts, under the blighting influence of these laws, must in

the near future decrease in the number of cottages (for a large proportion are in a decayed state); and therefore in population. Thus the working-men will be driven into the already overcrowded towns, and a grievous wrong be done them; and thus, too, the farmer

WILL BE DEPRIVED OF BUILDINGS

essential, it may be, to his making "both ends meet," through the resentment of the landlord to such by-laws and the increased cost of building. For, monstrous to relate, he could not so much as put up a pigsty without sending the plans to the district council for approval, and building the walls either on solid rock or 6in. of concrete, even though a mile away from his nearest neighbour. I shall be obliged, sir, if you will kindly insert this letter in the Times, for the question of building by-laws is fast becoming one of national importance through the reckless and unthinking way in which small bodies of little experience adopt them. They are so searching in operation, so costly in detail, so extensive in application that no authority short of the House of Commons should pass and impose such laws on the community. Dr. Langstaff writes: Experience on the Building Act Committee of the London County Council, now extending to nearly ten years, and covering the long period of the preparation of the London Building Act, 1894, involving protracted negotiations with architectural and other bodies concerned, and long proceedings before both Houses of Parliament, has made me realise the extreme difficulty of this subject. I stated before Lord Cross's Committee that the principle insisted upon by the Local Government Board—viz., that all building by-laws should be absolute, and that the local authority should have no power of relaxing the same—had led to evil results in the country, and that without such power of relaxation in the hands of the County Council it would be

IMPOSSIBLE TO FRAME ANY BY-LAWS FOR LONDON,

and in consequence of my evidence the House of Lords' committee overruled the objection to the Bill lodged by the Local Government Board. The truth is that the fundamental difficulty of framing building regulations is the extreme diversity of the conditions to be dealt with—e.g., even in London the difference between such districts as, say, the City, West Kensington, and Eltham, clearly demands different treatment. Your correspondent, Mr. W. Wykes-Finch, points out a general method of exemption which largely meets the difficulty—viz., in favour of buildings situate at a certain distance from other buildings not in the same occupation or the lands of different owners. Such an exemption existed in the old Act (18 and 19 Vict. c. 122, s. 6), but in a form that minimized its operation and

OFTEN PRODUCED ABSURD RESULTS.

The exemption was incorporated in the London Building Act, 1894 (s. 201, sub-secs. 11, 12), but in a form of much wider application. Dr. Poore objects that the speculating builder takes the minimum enacted by the by-laws as his model. I must confess that I do not see any means of entirely obviating the difficulty; but a liberal exemption of the kind advocated by Mr. Wykes-Finch, by freeing the builder from a variety of more or less vexatious restrictions, would give him a strong inducement in suitable cases to treat his land more liberally. This is not the place to enter into details, but certain obvious objections might be met by making some of the by-laws obligatory in all cases. Although the present building law of London fails in many cases to secure as much light and air as should be insisted upon, it still, in spite of valuable concessions to the architects, in some respects restricts without adequate reason the liberty of private individuals.

THE L.C.C. has become suddenly impressed with the fast disappearing haunts of London's illustrious dead. Having given Andrew Marvell his memorial on Highgate Hill, it is proposed to erect statues to two of the greatest citizens—Chaucer and Milton.

ORIEL AND BAY WINDOWS.*

BY PAUL WATERHOUSE, M.A., F.R.I.B.A.

THERE is something unusually humane about the rule of the Association which lays before the readers of papers, not merely the duty of producing an oration, but the subject of the discourse. The ordinary untempered request for a paper brings with it a double horror, for with the honourable burden itself there comes the duty of selection—a duty which, as the paper writer passes in review the possible titles of possible essays, so fills him with the sense of his own ignorance that the process of choice becomes merely a process of rejection, followed eventually by recourse (or shall I say relapse?) into some faltering selection of a theme where, for the moment, the mist of nescience seems to hang less thickly than over the surrounding regions of architectural learning. The course adopted by the Association is more humane. The committee gives one a subject—by what process of papers in hats, or balls in ballot-boxes, I do not profess to know—a subject and a man are mated and for better or worse, are introduced to one another. There is

BLESSING IN THE SYSTEM

—it saves a world of trouble, and is the means of introducing a large number of middle-aged practitioners to subjects of which they had previously no knowledge whatever. For the writer who is faced by an unresponsive title goes to his "Parker's Glossary" and his "Architectural Dictionary," drinks eagerly, if not deeply, at these fountains of knowledge, and comes smiling to his audience, refreshed with the sense of having put himself at least abreast of common knowledge in the subject which he has so lately made his own. Alas! for the student of oriel and bay windows; the dictionaries give them but cold comfort under either heading. You will find there, to be sure, a wonderful turmoil over definitions and derivations. You will learn there that some consider the word oriel to be originally and properly applied to the projecting

WINDOWS OF MEDIEVAL DINING HALLS,

or to that part of the refectory occupied by the monks who were slightly indisposed, while others hold that it originally connotes a recess for an altar or for prayer, whether a window or not, and that it certainly cannot properly be applied to the bay window of a banquet hall. *Orare*, to pray, is, say some, the foundation of the word, making it, apparently, synonymous with "oratory," while others see in it the Saxon for an "eye-hole," though why they should overlook the fact that *oreille* (a seventeenth century spelling of the word) means in French, an ear and not an eye, nor why again the oriel window should be considered more of an eye-hole than any other kind of window is more than I can say. Another derivation connects it with *Areola*, a diminutive of area which in certain senses is the equivalent of the "halo," of Greek origin—and, indeed, the similarity of the term aureole (undoubtedly based on a *reola*) favours this source, which is probable enough when one considers that circularity is the essence of the "halo." Plunge, if you desire it, into the controversy on this topic in the IVth Series of Notes and Queries, and you will learn at least enough to induce you to drop the use of the word altogether. Probably you will conclude with me that the ancients used the term a good deal more loosely than even we are tempted to do; and that an oriel,

LIKE A "YORKER" AND A "GENTLEMAN,"

is one of those things which can be better understood than defined, also that it makes no great matter for example whether you restrict the term to bay windows which are corbelled out, or extend it to those whose form continues down to the ground. Busybodies have been at work, too, even with the innocent term bay window, which most people can understand by

the light of nature as meaning a window whose bulging form, whether polygonal, semi-circular, or segmental, produces on plan a bay-like addition to the room it affects. But some wiseacre has produced a glossary of terminology to qualify the word. We are taught, for instance, of the "square bay" and the "canted bay," of the "compass bay" and the "square and compass bay," of the "bow bay" and the "square and bow bay," and lastly of an elliptic horror entitled the "cabinet window!" A modern tradition often enforced upon young gentlemen under articles of pupilage confines the term "bow" to the circular forms, and "bay" to the rectangular or polygonal, while yet another refinement of etymology would banish the word "bow" altogether. Let it suffice to say on this unprofitable topic that the ancients called them all bays, whether they had or had not angles in their composition, and that there are many examples to which we cannot deny ourselves the luxury of applying the gracious and expressive term bow. Thinking the matter over, it has seemed to me that we may well avoid in this evening's discussion both the etymological question and the archaeological. An historic treatment seems undesirable, and even the constructive aspect, important as it is, may well be laid aside for a season in favour of the attractive subject which I may call, for want of better title,

"THE MORALITY OF THE BAY"

—I mean its properties and its proprieties, and the rights and wrongs of its uses and significations. Has it ever occurred to you, in thinking about bays, that they are bound to be either the glory or the shame of the building to which they are applied? A bay window is, in the literal sense of the word, an extravagance, by which one means, not merely the escape of money from somebody's pocket, but a deliberate variation on the part of a building from the normal boundary lines of common construction. Now, it is in the nature of extravagances of all sorts that they must either be successes or failures, and the rule applies to bows and bays. They challenge attention both from within and from without, and if the attention they attract amounts to unfavourable criticism they bring shipwreck on the building they encumber. Let us think of the objects for which these excrescences exist. They are few, and consist of:—(1) The desire to increase either the

SIZE OR THE AMENITY OF A ROOM.

(2) The desire to enable the occupants to look out obliquely or even sideways without putting their heads out of window. (3) The desire to attract oblique sunshine to a room; or finally (4) A desire which is at once the most attractive and sometimes the most fatal of all—pure ambition of a worthy or unworthy kind. The word ambition is as happy in its literal application as was the word extravagance. Meaning as it does a certain "going round" it touches in its primary and literal no less than in its secondary senses the essence of the ambient bow. Now it may seem absurd to some of you to go thus intimately into the rationalities of an architectural feature; but I suspect that we architects can lose nothing by any attempt to study the true significance of any of the items out of which we compile our compositions. There is one special reason for thought in dealing with such a matter as this—namely, that if we find ourselves dealing in bay windows merely for looks, it is of vast importance to be sure of

THEIR EXCELLENCE AND OF THEIR PROPRIETY.

I am not arguing that utilitarian reasons only are the proper grounds for their application, but I wish emphatically to mark the necessity of ensuring appropriateness in the bay which is merely a luxury. We are all familiar with the commonest of all examples of inappropriate bays—I mean the almost invariable excrescence which decks the speculative villa. But let us be sure, in condemning it, that we condemn it on the right grounds. Ambitious as these features appear, there is generally an economic reason for their existence. Sometimes they are one story high, sometimes two, and, in either case, the use of this un-

lovely addition is generally dictated by one of Nature's fundamental laws—the economy of space—which is the economy of material. The one-story bay tells the passer-by, not merely that the speculative builder wished to give a spurious gentility to his drawing-room at the expense of the garden, but that, desiring to put on the ground floor a room of larger capacity than that of the floor above, he hit upon the bay as the best expedient. Even where the bay is two floors high, thus belying the reason just given, another cause may be at work. Without the bay, there would have been the need of making the wall of the large front room line with the wall containing the front door; in other words, the room would have had to be cramped or the entrance lobby unduly lengthened. In fact, the common villa bay, so far from being an ambitious luxury only, is generally born of the desire to keep down the cubic contents. So much for its shape, its plan, and its capacity; as for its decoration, that is another matter. That it is generally stop-chamfered on every stop-chamferable surface, that it has what they call a patera in the middle of every lintel, and that it boasts of columns of the fern-leaved order of Gothic—all these things are to its shame, but they do not disqualify its original title to existence. Someone should write an article or even a book on the cost of ugliness. The pathetic squalor of middle-class homes is greatly due, not to the absence of unattainable embellishments, but to the addition of the undesirable. I know a town in a good stone country, inhabited by persons of comparative wealth (for it is the country home of a neighbouring business centre), the architectural appearance of which has been hopelessly ruined by sins not of omission but of commission. I suppose that if, on an average, £10 less had been spent on everyone of the houses in that place, it might have been comely, whereas to-day it is loathsome.

IT BRISTLES WITH BAY WINDOWS,

of course, and they have nearly all got stone dressings, but there is scarcely a square arris to be found in the town, and not a chamfer but is mutilated with fancy stops. If all these chamfers had been run out to their legitimate terminations, or, better still, if half of them had never been at all, if all that square sunk foliage had never been square sunk, if all those pateræ (their creators call them "paterasses") had never been cut, the builders might have been richer, the rents might have been lower, and the town itself might have been natural and beautiful, instead of looking like the purgatorial region which lies between the Angel, Islington, and the Seven Sisters Road. Alas for the villa bay! Its existence is justified, but its usual development is one of the darkest sins of architectural wantonness. I have mentioned, as one of the legitimate causes of the bay window, the desire to obtain an oblique view from the room. To this cause is due the well-known and often gracious feature which one may call "the seaside bay;" with this we are all familiar, and, happily, we are able, among the bays of this class, to distinguish a successful as well as a disgraceful variety. The Englishman's cultivation of the seaside dates practically from the last century, and probably the desire on the part of landladies to claim a sea-view as an excuse for additional rental is coeval with the birth of watering places. It is to this excusable rivalry in the possession of

A GLIMPSE OF SALT WATER

that we owe, in most marine towns, the amiable belied fronts of the streets which run at right angles to the coast line. Without the use of bay windows a sea view in such streets would be impossible; with their employment comes the possibility of such a view—a little strained perhaps, in the further buildings, but still appreciable; just worth having and just worth paying for. Indeed, so identified in our minds is a street of bay windows with the mental image of a seaside spot, that the very look of certain houses suggests the sea as much as do bathing machines and a smell of tar. There are people who will tell you that they can smell the Channel on the north side of Hyde Park, but it is more a question of eyes than

* A paper read before the Architectural Association on November 25th, 1898.

nostrils. It is, in fact, the existence of a row of smiling, sunlit houses planted along one side of a broad street only, and, above all, the prevalence of bay windows, and especially of bay windows in certain transverse streets that cultivate the illusion—one falls irresistibly into the trap. You remember how in the play of Liberty Hall the old man says there are more "burials" than "blooms" in Bloomsbury. One might transfer the pun to Bayswater, where there are more bays than water, but the former do so connote the latter that they set one at least thinking of sand and waves, though all the time the houses are bowing and bellying and jostling round one another's shoulders for a peep, not at the blue ocean, but at the green trees and grass.

OH, THESE SEA-SIDE BOWS

—the real ones (not the Hyde Park ones)—how well we know them! The modern varieties are tall and pert, not circular, but octagonal, and bastard octagons at that, with one gaunt oak-grained sash in the centre light and two thin and equally tall ones in the side lights. And then the brickwork all covered with pale stucco, and the weak lead roof that lets the wet through! The old ones, how different and how insidiously attractive! As I write I think of one which, on plan, is about a third of a circle; it is divided into three sashes of equal size, all made circular, of course, and between them comes no brickwork, but just the sash boxing, so that, in fact, the entire construction is of wood; on the floor above the running of the front room over the entrance passage made the bay unnecessary for space, but unwilling to give up the lines of the bay, whose delicate curve means so much to the expression of the house; the designer continued the treatment, and added to its emphasis by a light metal roof of similar form, covering a curved balcony, with a balustrade of ironwork. A great deal of the charm lies simply in the shallow curve and in the appreciation, however latent, of the slight extravagance of the circular joinery. The cheap building of last century or of the early nineteenth century seems never to have denied itself circular joinery; but to-day—probably owing to the prevalence of machine-made mouldings—circular work is apparently the first thing one has to give up in the attempt to save money. In the circular sashes one's satisfaction rests not merely in the delicate form of the sweeping segment, but also mentally—and perhaps unconsciously, in a sense of the added labour, in which there is a gleam of Ruskin's lamp of sacrifice. Not that the later nineteenth century knows no extravagance. The householder who shrinks from laying out money on the refinement of a long-radius curve would scorn to be without his stained-glass "kingfisher."

IN THE PANELS OF THE FRONT DOOR,

and will probably run to tile risers for the steps. Can it, oh, can it be a fact that every age of building finds at last some corresponding period of admiration, and will it ever be the lot of some degraded generation to cherish a cult of to-day's abominations? Will there be some day talk, among the as yet unborn, of the good old days of our great-grandfathers and their cathedral-tinted door panels, their delicately tiled halls, their winsome stop-chamfers, and their charming bay windows, the angle piers of which were formed sometimes of quaint wire-cut bricks, covered with grey cement rendering, and sometimes with dainty cast-iron columns with neck mouldings—mark the extravagance—four times the true Palladian size, and branching capitals cast in the similitude of the common polypody. Such a day I hope can never come; or rather, when the time does come for our great-grandchildren to pass judgment on what is left of the bricks and mortar of to-day, they will have before them such a vision as we cannot have in any of our retrospects. There is in the work of to-day a visible contrast between the good and the bad such as is not to be found by any searcher of our time in the recesses of our past. The contrast line, unhappily, does not lie between architects' buildings and builders' buildings; for, to our shame be it spoken, there

are things bred on the drawing-board of men with brass plates which have to find themselves classed on the wrong side of the line. But that the contrast exists there can be no doubt, nor can there, happily, be a doubt that there are many beautiful things—bay-windows among them—which will do as happy resting-places for the eyes of our antiquarian descendants. But we are getting away from the bays, which, to do them justice, set one thinking and drive one's thoughts afield. In bays of the circular form—and, indeed, in polygonal ones as well, but perhaps specially in the former—it is important to remember, as a designer, that the plan form, whichever is adopted, is the most important thing about them; that it must be cherished and led up to, and that finally it will accomplish more of its mere self than a person of moderate experience would expect. Perhaps it seems unnecessary to say this, but there is a special reason for emphasising the observation. In the actual process of designing we deal necessarily with orthographic elevations as a means to our end. A similar bay window put on to an elevation is

A COMPARATIVELY DULL THING.

You as architects, realise its circularity on your own or other men's drawings, especially on your own, by the toil of drawing in the mullions in oblique elevation. But the drawing does not tell its full tale of effect, and you may be tempted to attach an (apparently lacking) interest to the member by some addition to the simplicity of its lines—some crowning feature, for example, or an addition to the centre of the cornice, if there is one. In this there is danger of error. The circular or segmental plan once adopted, you cannot serve its end better than by the accentuation of the horizontal lines which partake of the circularity. Herein lies the difference, or one of the main differences, between those old bays that we admire (be they stone and Tudor or wood and Georgian) and the modern horrors in which hang the "apartment" labels. The modern bay makes for height in its apertures; it avoids bars, especially horizontal bars, in its glazing; transoms are probably altogether absent, and the piers are made thick and heavy so as to break even the moderate continuity of the sashes meeting rails and of the heads and sills. With the older types this is different. Copious window bars (or in stone work well defined transoms) perform the double office of

BREAKING-UP UNDUE VERTICALITY

and of emphasising the plan-form of the bay, while the small piers, mullions, or sash boxes only produce as much intermission as the eye (that unconscious arbiter of stability) demands as a guarantee of sound construction and as a preventive of the worst of all faults—the over-bowing lintel. If you do not know what I mean by this last, ride down Oxford Street on a 'bustop and look at the excrescence which is the sole feature of the Frascati restaurant. To design a bay of this description, you take a centre on the frontage line of the building (or a little outside it if you prefer to increase the effect), and turn a wall circle the inner radius of which is only about three times the length of the thickness of the wall. Here you have produced on plan a semi-circular bay which you proceed to embellish by the insertion of one mullion. To be sure, the omission of mullions altogether would have made the thing more startling, but the one mullion gives the public enough to reflect about with some sadness. As they pass the building they naturally and generally view it obliquely; the eye glancing across the curve which looked so fair on plan, and at least respectable on elevation, takes a straight line from the edge of the single mullion to the jamb, and above it they see transome and head vaunting their unsupported circularity. This sad example leads to what one may call

AN AXIOM OF ALL GOOD CIRCULAR WORK,

that the vertical supports must always be sufficiently close together to prevent the appearance of the horizontal members being unsupported. This rule is, in one sense, the counterbalance of what I mentioned before—the need of emphasising the horizontal members; but it is surprising how little, how

slender, the vertical supports may be and yet satisfy the eye in this matter. In the old inn windows of many a coaching hostel the slimmest glazing bars between the glass panes are enough to prevent the eye being troubled by any optical instability. In the splendid segmental or semi-circular bays, which are the glory of some of the country houses of our English Renaissance, the mullions are always so placed that there is no chance of offence in this respect. It should be borne in mind that the relative closeness of these vertical supports is necessitated and regulated, not by the measurement of the length of segment, but by the length of its radius. The flatter the bay, in other words, the less need for the frequent support. It will readily be understood that the greatest importance attaches to the way in which a bay is covered in. Obviously a bay, like other structures, can be roofed in either of two ways—either with a flat roof or a sloping one. If your bay extends upwards to the whole height of the building its roof may possibly form a part of the general roofing of the house. This, which is often a successful treatment, needs handling with great caution, especially if the bay be large and the building comparatively small. In a very large structure the roof of the bay, whether polygonal or circular, can appropriately be formed as a member growing out of the rest of the roofing; or it may even, if the plan of the bay be part of a regular polygon, or of a circle,

TAKE FORM AS A TURRET,

and rise above the apex of the normal roofing. It is, however, very often the lot of a bay window to be the largest feature; or one of the largest features, of a comparatively small house, and in such a case the use of a high-pitched roof of such wide span, with eaves at the level of the general eaves, will often result in the production of a feature whose size will swamp not only the building, but with it the bay itself. It may easily happen that the architect finds himself driven to the use of a flat invisible roof for his bay for this very reason, that any form of sloping roof would work itself out into something too gigantic for the scale of his building. There is one treatment, popular some few years ago, which I think we may unhesitatingly condemn as inappropriate in nearly all cases. It abounds in the neighbourhood of Fitzjohns Avenue, and consists in the cheerful expedient of clapping a gable of the full width of the bay on to the unfortunate erection, which is placed in the difficulty of reconciling its own polygonal form with the square structure which surmounts it. The problem is usually resolved by one of two expedients. Either the canted angles of the bay are treated as gigantic chamfers, and brought to the square by

THE USUAL LATTER-DAY EXPEDIENT

of a vast stop, or corbelling, or the gable, which is at times half timbered, gets its triangular soffits supported by a bracket. These expedients, particularly the bracket business, are unhappy at best for they cast a shadow on to the splayed windows, besides offering gratuitous harbourage to sparrows and their nests. If a bay must be surmounted by a gable, there are ways of getting over the difficulty. One may make the bay itself square and so produce one of the most beautiful features that can be devised. Indeed, so successful is the appearance of the square bay under a gable that where this form is used one can tolerate a greater width in the gable, and a resultant soffit on either side, though the triangle soffit left by the polygonal bay is so far from tolerable. All good rules have their exceptions, I suppose, and there are buildings of bygone days which successfully carry through even the problem of the square gable on the canted bay. You may see an example in the Talbot Inn at Oundle. The homely satisfaction of this building goes to prove that our forefathers could sometimes succeed where their descendants generally fail. On the whole, one of the most beautiful treatments, though a very unusual treatment of a gabled bay of polygonal form, is that of which one finds an example at Weston, an

old house between Leeds and Ilkley. In this case the front or flat wall of the bay runs up to form the gable face, and the splayed sides are surmounted by parapetted wings with finials. The wings having horizontal copings do not, of course, exactly follow the line of the roof. Viewed from the back, if one could so view them, they would present the appearance of triangular blanks, but there is no great harm in this, nor, indeed, would there be any harm in their following the roof line, sloping downwards. A gable formed on a canted plan is often very successful, as those will agree who know the gabled apse of St. Michael's Church at Folkestone, where the gable is, like this at Weston, so to speak, three-sided. In cases where the bay we are dealing with has walls which are lower than the main walls of the building, the roofing difficulty is often nearly as great, at least where pitched roofing is attempted; and the difficulties in this case are caused by the intersection of the bay roof with the vertical face of the main wall behind. It is obvious that the roof of a segmental bay, if projected at an oblique angle on to the main wall, produces nothing more or less than one of those eccentric outlines which the geometers know as conic sections. With a polygon—if it be (as it generally is not) the exact half of a regular figure—there is no great difficulty, as the centre of the figure will line on the wall line, and the roof can be brought up to a true apex with regular mitres on the hips. But when the figure formed by the plan of the bay is something less than the half of a regular polygon,

A LITTLE COOKING

is sometimes indulged in with results which are elegant on the elevations, but disastrous in the eyes of ordinary spectators, who cannot be induced to see things as they would appear on a drawing-board. Generally speaking, canted bays are not parts of regular octagons, but have their canted sides less than the front. In such a case there may be a small piece of straight return between the cant and the wall. It then becomes necessary to regulate matters so that the hips of the canted sides shall exactly meet on the wall line, otherwise a roof is produced which nothing but cooking can save, and which the said cooking will generally shipwreck. In this connection it is well to observe that many of the best old examples, particularly in Tudor and Renaissance work, have no square returns at all, and further that the angle of the cant is frequently flatter than 45°. There is, to be sure, an objection to the practice of allowing a very flat cant to die into a wall face without the intervention of a square return, namely, that the mouldings of the bay become unduly developed in their incidence upon the wall. This difficulty has to be met either by

EXTREME MODESTY ON THE PART OF THE MOULDINGS

which have, in fact, to moderate their projection, or by continuing the same mouldings on the wall face as strings or cornices. On the whole, there is a good deal to be said against pitched roofs for bays of the lower description, unless it be in the case of those with roofs of weathered masonry. In these it need hardly be pointed out, the *planning* must be done in strict regard to the form which will be brought about by the intersection of the roof slope with the back wall. There is one simple consideration which often altogether upsets the possibility of applying a stopping roof to a bay, namely, the height which such a slope occupies upon the wall space. If your bay projects 3ft. it is obvious that with a slope of anything over 45 deg., a pitched roof with its flashings will make a window for the room above almost an impossibility, unless its sill be at an unusual height from the floor. The corbelled windows, to which we generally and perhaps incorrectly apply the term "oriel," are frequently covered with high-pitched roofs of masonry, but with this exception the bays of mediæval, Renaissance, and Georgian architecture—in fact, all

THE BEST BAYS OF OUR ANCIENT PERIODS

are covered with flat roofs, or with roofs so flat as to be invisible behind their parapets. The roof in these cases being of no account

architecturally, it remains to be considered how the parapet is dealt with. Some of the best examples in this, as in other departments of Architecture, are the quietest. I noticed the other day, in a remote East Coast village, a plain brick house, whose only challenge for attention was a front door and two bays. The bays were canted, and very flat, and they extended to the whole height of the wall—in fact, their coping, a 3in. York stone, was level with and identical with that of the main house wall. Our modern Georgians would have put a ball at each of the angles perhaps, and the balls would have looked very well too. I should not blame them. The composition I am speaking of, simple as it was, did without the balls, and looked as nearly perfect as things of the kind can look. It was as if a plain brick front, adorned only with the necessary openings, and its equally necessary coping, had been taken and bent in two places to form the bays which, with the door, were the only ostentations of the house. The roof, of course, ran straight, did not break over the bays, and the slight projections of the bays were covered by a lead flat, which was little more than an extension of the gutter of the main roof. In these cases we have the simplest treatment, which, however successful, is no argument for the suppression of all more ambitious conceits. Parapets in all ages have been things to play with, and the bay being, as one might say, the luxury-point on a house's front, is not the feature to forego all licence. Our old friend, the battlement, used even by the ancients, as much for ornament as for the defensive objects which its warlike name implies, is a frequent infester of the tops of bay windows. He is not inadmissible, but he should be used with care. Too big he becomes gigantesque and ludicrous; too small he is liliputian and again ludicrous. Even when the proportions are sound he may break up indecently the horizontal continuity which I have spoken of earlier as one of the secrets of success in a bay. Open work of most kinds in the parapet involves piers, and these again, though very valuable in the canted bay as implying strength at the angles, may introduce an ill-placed verticality. Our modern trick of the festooned or swooping outline is sometimes happy, but is better employed on the straight-sided bays than in the circular, and the same may be said of finials (whether balls or other forms) unless they occur with such frequency as shall cause an effect of *series* so as rather to carry the eye along the line we are emphasising than to interrupt that emphasis. Where indulgence is taken in open-work parapets or in finials or other means of breaking the outline, it is still possible to maintain the emphasis of plan form by a cornice of some vigour. There is, especially in the circular forms of bay, a marvellous charm in the simple bending of a moulding, however unelaborate, to the selected form. Even a plain unmoulded band, say of stone, among the brickwork has its value, and in cases where the bay is not mullioned, but pierced with large sash openings, it is difficult to over-estimate the importance of all the horizontal bands in giving continuity to the form. A base will often help—even a single plinth with the smallest possible projection; just enough to catch the light and continue, so to speak, the message of circularity. It is time to say something of those bays whose form is not continued downwards to the ground level. The simplest way of treating such a feature is obviously to cut it off flat, and, strange as it may seem, there are many examples of such bays on a small and homely scale and in wooden construction which are singularly successful and happy in effect. The bare idea is contrary to all one's notions of propriety, and the bald simplicity is helped in many cases by a slender wooden corbel or cantilever, which makes no pretence of really doing the work; but the fact remains that in many old villages, such as these which happily still surround London, there are small bays of this description with absolutely plain soffits which are not by any means displeasing in their appearance. The corbelled-out bay, to which, as I have mentioned before, some authorities restrict the name "oriel," is a more favourite feature in

foreign Architecture than in our own. If you look through the pages of those two monumental works on the Renaissance—I mean the *Denkmäler Deutscher Renaissance* and Mr. Gotch's book on our English buildings of the same period—you will be struck by the fact that, whereas bay windows abound in both, the German examples are very largely of the corbelled-out variety, while the English ones are almost invariably of the simple, solid, down-to-the-ground type. Where the Englishman broke loose was in his timber work; his bays in woodwork are sometimes marvels of projection, but in stone the Briton was ever more modest than his foreign rivals. It may be said to the credit of the English that they have never been very over-reaching in the matter of corbels. Visible stability, even in the wildest days of the early Renaissance, has always been as much revered in English architecture as it was ignored elsewhere. There are nations whose natural impetus has led them in Architecture to the production of portents. It has been their aim to make stone look like a lace pocket-handkerchief, or to run it fine with corbels in real buildings as a child sports with gravitation in his box of bricks. These tricks have not been English tricks, and where they grow on English soil they are of foreign planting. We may be known by our bays and bows as by other things, and our solidity is something of a virtue. At the same time, one must allow a certain beauty to even the extravagant German frolics. Those bays in particular which grow out of the angles of a building are sometimes of singular grace, and when they are of the square type are often so arranged as to do no violence to the sense of stability. I had promised not to go into the construction question, but there are one or two points of appearance so closely allied to construction that I cannot conclude without a reference to them. First, as to bays

AT THE ANGLE OF BUILDINGS.

It is a common fault, and a perfectly avoidable one, to so place a bay at the corner of a room that the carrying of the wall angle above it becomes to inquiring spectators a matter of conscious or unconscious anxiety. I am applying principally to villa building. Of course one knows there is some jugglery of rolled steel joists going on out of sight, but there is no reason why the unconscious faculty which asks building construction questions on its own account should have been worried at all. It is perfectly easy to so plan a bay, circular, or square, or polygonal that the normal wall angle shall be either upon or slightly outside the line of the bay. This gives no detriment to the effect within, and is a great relief to the spectator inside. To have anything so cardinal as the angle of a building apparently descending into the untrustworthy embrace of the lead flat over a drawing-room bay is, to well-ordered minds, a sin. There is also sometimes a sin in the popular collegiate device of a corbelled bay over an entrance-archway. It may be all right in appearance, as well as in construction, particularly if the corbelling is not pressed too hard on to the arch. If well arranged

THE CORBEL AND ITS BURDEN

seem only to be paying a compliment to the stability of the arch, but if once you get anything approaching to a collision between the arch moulds and the corbel the result is miserably weak—at least in looks. If close quarters are essential some form of keystone treatment is the only possible expedient. One may make a Classic or semi-Classic keystone the base of a corbel where it would be impossible, on grounds of appearance, to let a corbel take liberties of trespass with a Gothic arch. It is time for me to draw these rambling remarks to a conclusion, and I feel the lack of any great central doctrine or leading truth with which to pull the subject together. These bays of which we have been speaking grow more in the house than in the palace; indeed, the monumental styles of Architecture find less opportunities for their use than the more strictly domestic. The bay has no place in the Palladian method, and though one may find here and there a Classic clubhouse, whose

smoking-room has an ex-crescent window claiming the name of bay, you will discover it to be disguised outwardly

BY SOME TORTURED COLONNADE

whose insulted entablature seems to be only waiting for the time when it may go back to the straight again. Gothic Architecture and the freer Renaissance styles gave the opportunity of using bays even in buildings of size and dignity, but the bay as we have ordinarily to deal with it, is the appendage of a house—of a home. Its importance as part of a design can hardly be exaggerated. It is, if one may use a homely simile, like the nose on a face. Add 10 per cent. to its size, or take a degree from its flexure, and you may ruin the countenance—I should say the elevation—to which it belongs. A young architect not infrequently opens practice by “throwing out a bow” for a relation. The simple manoeuvre is thought to be a safe task to entrust to an unrisen genius. Confiding friends! They little know the risks they run. To be sure, the money-hazard is less than of the cost of a house, but they little understand the test to which they put their aspiring architect. You know Tennyson's poem of the flower in the crannied wall—

“If I could understand,” he says,
“What you are, root and all, and all in all,
I should know what man and God is.”

The knowledge of the little is a test, in fact, a proof of the knowledge of the great—of all. So with your bit of a bay window. It isn't any fool's job. There is a task for eye and hand, a task for the senses of proportion and propriety, a task, in fact, for all the powers that go to make an architect even in the least of these trifles. Bays and oriels are not to be despised. If a man can design them, it is, perhaps, a sign that he can design most things. “Throw out your bays” by all means, and if you can do them worthily you are probably capable also of throwing up your town halls and your palaces.

THE parishioners of St. Lawrence Jewry and St. Michael Bassishaw met to consider what steps should be taken to remove the Sacramental plate, the fine old Grinling Gibbon carved work, and the monuments, for which St. Michael's, one of the creations of Christopher Wren's architectural genius, is famed. The two parishes, by a recently-formulated scheme of the Ecclesiastical Commissioners, are now amalgamated. It was resolved to apply to the Commissioners for a faculty to remove to St. Lawrence's the plate and church services. As to the monuments, the Rector said it would be difficult to find room for them, as St. Lawrence Jewry was at present a veritable Campo Santo with its many memorials of the dead, and it would be as well to leave their future disposal in the hands of the Ecclesiastical Commissioners when St. Michael's is demolished.

WRITING to The Times in connection with the proposed widening of High Holborn, Mr. H. C. Jones, Clerk of the Board of Works for the St. Giles District, recounts the circumstances of the suggested improvement. He says:—“The attention of the Board was first directed to the desirability of an improvement being effected when the old buildings were demolished. On May 11th, 1898, I addressed a communication to the Clerk of the London County Council urging that the opportunity should be seized for carrying out the much-needed improvement. Further communications passed between the Board and the Council upon the subject, from which the Board were led to believe that their recommendation would be adopted. On July 19th last the Improvements Committee of the London County Council presented a report recommending that the Board's suggestion for the widening of High Holborn between Southampton Row and Southampton Street to 70ft. should be carried out, but the reception of the report was opposed and the matter stood over. At the next meeting the Improvements Committee presented a report stating that, upon reconsideration, they had determined not to proceed further with the improvement and withdrawing the recommendation.”

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

November 30th, 1898.

“I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs.”—JOHN RUSKIN.

AT last the committee intrusted with the selection of the piece of Architecture to be copied for the forthcoming Paris Exhibition has come to a decision. The British pavilion in Paris will be in every exterior detail a reproduction of Kingston House, Bradford-on-Avon, Wilts. This is considered to be one of the handsomest examples of seventeenth century Architecture in England, while the house has many historical associations. The replica to be erected in Paris will provide accommodation for the Prince of Wales, when, as is expected, he visits the exhibition. Except on those occasions the house will be open to visitors.

A DEPUTATION from the Society of Architects has just waited on the Lord Chancellor, and presented a petition praying that a Parliamentary Commission should be appointed to inquire into the present law with regard to ancient lights, with a view to saving the large amount of moneys being expended in determining the rights of owners in regard to the same. The deputation was introduced by the Earl of Hardwicke, and comprised Mr. Walter Emden, J.P. (President of the Society), Mr. Silvanus Trevail, J.P., and Lieutenant-Colonel F. S. Leslie, R.E. (the Vice-Presidents), Mr. Ellis Marsland (Hon. Secretary), and Mr. H. Morse Hewitt (Morse Hewitt and Farman). The deputation proposed that a Building Act tribunal of the London County Council should be appointed to deal with, prior to the commencement of building operations, applications made by owners of buildings to define the limits within which they are entitled to build, having regard to the adjacent properties, and also a similar tribunal for other parts of the country.—His Lordship, after discussing the matter, informed the deputation that he would give the matter careful consideration.

ONCE upon a time a municipality—we think it was Brighton—were seriously annoyed by the vagaries of an elderly citizen of large means whose hobby it was to buy up house property in the town and allow it to remain unoccupied for months and years. The result was not only to render ugly the streets in which these derelict tenements with their blindless dirty windows were situated, but also seriously to diminish the rateable value of the town, since no rates were chargeable on these empty houses. Without entirely approving the tactics of that elderly gentleman, we could almost wish, says the Globe, that some millionaire, or better still, some syndicate of many millionaires, would devote themselves to buying up vacant sites in London, and keeping them vacant. Though it saddens a Londoner to see some more or less historic building come to the housebreaker, yet for a few weeks or months he is a little comforted by the new sensation of light and air in streets which had long been strangers to these blessings, and by

the unaccustomed vistas which the demolition has opened to his gaze. Not long ago Drury Lane was for quite a considerable period one of the breeziest thoroughfares in the metropolis by reason of the large number of houses which had been simultaneously pulled down there. Just now Holborn is in the same desirable condition owing to the destruction of Furnival's Inn. But it will not last. Already the masons and the bricklayers are at work on the foundations, and very soon they will have raised some gigantic building, whose architectural beauties will not console us for the light that it will shut out.

IF there is any real necessity for the establishment of the Central School of Arts and Crafts which is projected by the County Council, some serious failure to fulfil their professed mission must be credited, says the Globe, to the Government Art Schools at South Kensington and elsewhere in London. These particular centres of Art education are supposed to exist especially for the benefit of the designer and craftsman, and to offer advantages to the student of the applied arts which are denied to the would-be artist. Yet in all directions are being established Polytechnics and technical schools independent of Government control, and managed on lines that are quite distinct from those followed by the Science and Art Department. All this implies that the system to which the official educators are committed is not recognised as either complete or efficient.

SOME definite changes in the policy of the Government schools would certainly seem to be necessary if they are to maintain their authority. If they are to be places where picture painters can be trained, masters must be provided who have a sound acquaintance with the principles of pictorial art; and if the claims of handicraft are to be preferred, the teaching must be in the hands of men who know by actual experience what is most likely to be useful to the craftsman. As things are at present the Science and Art Department is being ousted from its position because it caters properly for neither class of students; and the work it might do is being taken from it by other bodies which are better in touch with the educational necessities of the moment. But this duplication of schools throws upon the community that has to pay the cost of these competing establishments a burden that is, to say the least, very inconvenient.

A CORRESPONDENT, writing to the Times in reference to Sir John Wolfe Barry's address on London Highways, emphasises the necessity of every opportunity being grasped for opening new thoroughfares and widening those now existing. “That this necessity is imperfectly appreciated,” he proceeds, “is evident in the case of the Cheapside improvements now about to be made between Newgate Street and St. Paul's Churchyard. The demolition of all the houses immediately behind the Peel statue affords an opportunity for completing a portion of the scheme of Sir Christopher Wren, referred to by Sir John Barry, and it is only natural to suppose that the City Corporation would jump at such a fine opportunity for opening up in a wide thoroughfare the northern roadway of St. Paul's Churchyard, now barred and useless for wheeled traffic.”

BUT what are the facts of the matter? The block of buildings at the corner of the churchyard, now occupied by Mr. Nicholson, is the property of the Bridge House Estates Committee of the Corporation, and that Committee has had the future disposition of the site in question under prolonged consideration; in spite, however, of repeated reminders in the Court of Common Council of the glutted condition of the City traffic, and the desirability of seizing this opportunity to open up a new channel, already half made, the Court has now granted a lease of the property for eighty years to the present occupier, and at a greatly increased rental. When the matter was under discussion in the Court it was strongly and clearly pointed out that the northern side of the churchyard is, geographically, a portion

of the great main highway running through the Metropolis, extending from Bow and Stratford in the east to Westminster in the west, and that the opening up of this barred section of the highway would be the natural complement of the widening of Ludgate Hill, and of the Strand and Fleet Street improvements, but all to no avail. As the matter now stands this magnificent improvement is blocked for eighty years to come, unless at a considerably increased cost to the ratepayers.

THE complete scheme need not be effected at once; all that is needed now is that this obstructing house shall be put back to a building line, on its southern face, corresponding with the north side of Cheapside; the remainder of the scheme can be continued as opportunities occur by the falling in of leases, thus extending the cost of the work over a series of years. Immediate action is requisite to prevent the commission of such a blunder as that I have indicated above, for it is only by the pressure of public opinion that the progress of the scheme on its present lines can be arrested.

WHEN Sir Henry Tate gave £80,000 for the fine gallery for British art at Pimlico he arranged that the building to be set up with the money should be so designed that, while complete in itself, it should be capable of extension to just about double its original size. That extension is now being carried out, and, indeed, is far advanced that the new building has attained its full height, and the scaffolding will soon be cleared away from the external walls. The new portion will be rather larger than the old, or, at any rate, will afford more wall space.

IN the extended Tate Gallery an important feature will be a large central floor for British sculpture. The terms of the Chantry bequest have unfortunately been legally interpreted in a way that will, it is to be feared, put some difficulty in the way of filling this gallery. That bequest stipulates that works purchased shall be finished and complete, and one of the Courts has decided that in the case of sculptures this means that only bronze or marble can be purchased, the artist's modelling being regarded as the sketch from which a finished work may not be commissioned, though that finished work may be only an exact reproduction in a more valuable and enduring material. The effect of this ruling is that artists who cannot or who do not care to afford the expense of marble or bronze until they are sure of disposing of their work have no chance of getting it purchased by the Chantry Trustees.

To get upstairs without any particular effort is a desideratum with many people, and hence the invention of the now familiar "lift." But at "Harrod's," Brompton, visitors are shown how to ascend to the upper regions by means of a "revolving" staircase. The operation is simplicity itself. The "traveller" puts his feet on the staircase, his hand on the rail, and is "wafted" by imperceptible motion to the place where he would be. The invention is new to England, but has, for some time, been at work at the Grands Magasins du Louvre, in Paris. The staircase consists of an endless floor, on rollers, and the machinery is in the basement. The inventors suggest that "the moving staircase" would be of great use in hotels, railway stations, &c.

THE most troublesome piece of work in connection with the Central railway is the roofing over the subway in front of the Mansion House. The subway itself has been excavated, and its walls built round, but at present the whole of the roadway with its tremendous traffic is supported on timber. The problem to be solved is how to remove the entire surface and the timber supports beneath and to replace them by a fabric of iron and steel, and to lay down a new roadway of concrete and asphalt without interrupting the vehicular traffic. It will be dealt with, of course, bit by bit, and the Act of Parliament authorising the work requires that it shall be done wholly by night, and that holes shall be

timbered over for the passage of vehicles by day. The Company are trying to get the consent of the City authorities to their working throughout the day and night. They urge that it will take a couple of hours every morning to construct their timber viaduct, and two hours more at night to clear it away, so that their night will be short, and the day will be wholly lost. The continuous working would involve some diversion of traffic, but it certainly looks as though the speediest method will be the best.

AFTER a prolonged and arduous work, the Midland Railway Company have now opened a portion of the widening of their line between Kentish Town Station and St. Pancras. For some time past a sort of bottle-neck has existed at this part, and the suburban traffic has frequently been very congested. The widening has been in operation for several years; and, now that it is completed, the suburban traffic between Kentish Town and Moorgate Street will be considerably accelerated. Four additional platforms have been provided to meet the requirements of the suburban traffic, two at Kentish Town and two at Camden Road Station. The same Company also opened, at Somers Town, a new coal depôt, which has a superficial area of over ten acres. Hydraulic power is used throughout, and by means of four lifts about 400 wagon loads of coal may be emptied daily. In pulling down a part of old Somers Town a fine artesian well was discovered, from which sufficient water can be obtained for all the hydraulic power necessary. This huge addition to St. Pancras Station has cost fully half a million sterling, and the erection of a second surface above the level of the roadway is quite a feat of engineering.

THERE exists in Austria an Art and Industrial Museum, the objects of which are to promote the production of artistic goods in the various manufacturing industries. The chief means adopted by the museum is to prominently exhibit models which it considers suitable for Austrian makers to imitate. The Archduke Rainer, a cousin of the Emperor, has for many years been protector of the museum, and under his direction no furniture has been exhibited there except in old German style or purely Viennese work. Recently a new director of the museum was appointed, a certain Councillor Scala, and he at once set himself the task of introducing English furniture into Austria. English furniture now has the place of honour in the museum, and the result has been a marked increase in the purchase of English furniture in place of the cumbrous old German work. The Archduke Rainer protested in vain against the Anglicising of the furniture industry, and resigned his position as protector of the museum when Councillor Scala persisted in his course. A storm of indignation from the local furniture manufacturers has likewise failed to move Herr Scala, and the importation of English furniture proceeds apace.

THE feature of the Old Masters' Exhibition this year is suggested by the Amsterdam Exhibition. It is to be a collection of Rembrandts. Sir Edward Poynter has obtained promises from practically all the English contributors to the Amsterdam show to allow their pictures to go to the Academy on their return from Holland. A few of the foreign Rembrandts may also be included in the London show.

SIR W. B. RICHMOND has just delivered to the Hampstead Art Society another of those interesting lectures on his work in mosaic, which have marked the various stages of his progress with the St. Paul's decorations. He insisted with justifiable pride upon the importance of his achievement in practically creating a school of mosaic workers in this country, and claimed for the result of their efforts a position by no means inferior to the best that has been done in other parts of the world. As an instance of the growth of skill in the craftsmen under his direction he referred to the quarter dome just unveiled in the Cathedral, which he pronounced to be one

of the finest pieces of mosaic he had ever seen. To have so far perfected in the short space of seven years a form of decoration scarcely understood before by British workers is immensely creditable to his energies.

IN Part IV. of "The Temple, London," which is being issued by Messrs. Frost and Reed, Mr. Percy Thomas illustrates "The Master's House," and "The Choir of the Temple Church." Both are etchings of more than usual merit, delicate in handling, capable in draughtsmanship, and agreeable in their refinement of tone. They are distinctly attractive as renderings of picturesque subjects, and do credit, both in selection and treatment, to the artist's judgment. Canon Ainger, the Master of the Temple, continues his descriptive notes on the plates.

OLD ENGRAVINGS of London are getting scarce, and fine prints especially are now rarely obtainable, except at greatly advanced prices. The sale of the second portion of the collection of the late Mr. J. H. Wilson at Sotheby's last week was therefore of exceptional interest. Many of the prints and drawings related to Central London, but there was a fine collection of views south of the Thames, together with some relating to the districts east of the Tower.

MESSRS. CHRISTIE, MANSON, AND WOODS sold on Wednesday week old English and Irish silver plate, &c., from various sources. The more notable lots included 36 silver dinner plates, weighing a total of 690oz.—£217; a collet necklace, composed of 61 graduated brilliants, and with single-brilliant snap—£285; a silver-gilt tea-kettle, richly chased in relief with medallions of figures in Chinese costumes, festoons of flowers, &c., by William Grundy, 1758—108oz. at 26s. per ounce; a parcel-gilt beaker-shaped cup and cover, on three ball feet with pierced appliqué ornament, chased with grotesques, a group of the Good Shepherd in the centre, 12in. high, 30oz., Augsburg work—£46; a pair of ormolu wall lights, with scroll branches for four lights each, mounted with old Dresden porcelain figures of birds—60 guineas; a pair of Louis XVI. bronze fire-dogs, with Chinese figures—40 guineas; a pair of Louis XVI. ormolu candelabra, with figures of Cupids supporting scroll branches for ten lights each, 40in. high—66 guineas; a set of ten carved mahogany Chippendale chairs and two armchairs, from Lady Jane Goding's collection—£68; a set of four Chippendale mahogany chairs, carved with a belt and scrolls, an arm-chair and a settee, both nearly similar—£52; and a large Sheraton mahogany wardrobe, inlaid with medallions of figures, flowers, trophies, and ribbons in satin and other woods, 84in. high, 100in. wide—£70.

WHEN the scheme for improving Downing Street is carried out, that part of the garden which belongs to No. 10 will be left as it is now; but the five-story building which is to occupy the site of No. 11 (at present the residence of the Chancellor of the Exchequer) and No. 12 (the Government Whips' office) will cover also the open space at the back of these houses, and the garden of No. 10 will thus be sandwiched between two high walls that will restrict the outlook to a bit of the Horse Guards' Parade. When the western end of Downing Street has been rebuilt in accordance with the plans of the Office of Works, the Board of Agriculture, and the Irish Office will be transferred thither, the former from Whitehall Place and St. James's Square, and the latter from Old Queen Street.

THE First Commissioner of Works has, through the Hon. R. B. Brett, written to the vestry of St. Margaret and St. John, Westminster, stating that the remaining blocks of buildings between Parliament Street and King Street will very shortly be demolished, and the site between those streets entirely cleared. In these circumstances it is desirable, he states, that the new line of street adopted by the Government should be formed without delay, and it is suggested that steps should be taken

as soon as possible to carry out the requisite alterations. The Works and General Purposes Committee of the vestry will recommend that body to inform her Majesty's Office of Works that the vestry concur in the desirability of the new line of street being formed without delay, but that it does not appear that the Act of Parliament under which the improvement is being carried out imposes any obligation upon the vestry in the matter.

PROFESSOR J. W. HALES, lecturing at Hampstead to the members of the local Antiquarian and Historical Society on the famous hostelry known as "Jack Straw's Castle," now in course of rebuilding, said it was almost certain that from early times an earthwork stood on the site of the present building, and hence the name of "Castle." Jack Straw, a leader of the revolt of the peasants in 1381, was credited with having made a camp on the spot, but historical authorities were against it. On Wednesday, June 12th, Wat Tyler, at the head of the Kentish men, was encamped on Blackheath; while Jack Straw, with the Essex contingent, was at Mile End. On Saturday Wat Tyler was slain at Smithfield, and the insurrection was over. Jack Straw was taken and executed on the Sunday, and it was hardly possible that he could have found his way to the part of the heath which now bore his name. It was quite clear, however, that Jack Straw and his men went to Highbury, and there attacked the country seat of the Prior of the Knights Hospitallers, against which Order the peasants entertained a great hatred. Highbury Barn was the grange connected with the ancient priory, and Highbury could lay claim to a genuine "Jack Straw's Castle." The hostelry was originally a private house, built at the beginning of the last century, and it was a curious fact that the wood of the gallows on which a highwayman was hanged in 1673 was built into the wall. About the middle of the last century it became a public-house, and seemed to have been merely known as the Castle Inn. The first literary mention of it as "Jack Straw's Castle" was in a book called "The Cabinet of Curiosities," published in 1822.

Just a year ago the great fire of Cripplegate took place. For months, it will be remembered, the whole area was left in much the same state as when quitted by the firemen. Negotiations that were in progress with a view to running a central street through the district, and widening the other thoroughfares, were the cause of the delay in resuming constructive operations. When these schemes failed in April, with one accord owners started to rebuild, and the whole area in a very short time became a veritable forest of scaffold-poles and timber. When once the builders had taken possession no time was lost, and now, a year after the event, with the exception of a long gap on the churchyard side of Well Street, the whole of the premises have practically been rebuilt, on just the same frontage lines as formerly, not an inch having been conceded to the public in either of these busy streets. Although the site is now roofed in, much remains to be done before business resumes its wonted course. In Jewin Crescent very much remains to be done, but there is much more activity here than in Well Street, where a very large space running almost from the vicarage to Nicholl Square shows no sign of development. The vicarage has been restored, as has the Church of St. Giles.

A NEW STREET, connecting Crutched Friars with Fenchurch Street, at a cost of only about £13,000, may be described as something very cheap in the way of Civic architecture. The new thoroughfare will run from John Street, Crutched Friars, through a vacant site, and will be 40ft. wide, the Corporation making the roadway and constructing sewers, subways, and vaults. The owners of the vacant space have agreed to contribute £6000 of the sum mentioned, also to give up land, which has been valued at nearly £90,000. In return they will receive frontages to the new street, the creation of which is bound to greatly enhance the value of the site.

Professional Items.

ABERDEEN.—The new Church of St. Peter, at Walker Road, Torry, was formally opened last week. The new church is a handsome addition to the Ecclesiastical architecture of Aberdeen. A notable feature is its height. The church is constructed on the design of a nave with projecting right and left aisles, which are supported on internal pillars. The width of the nave is 35ft., and the height from the floor to the apex of the arched ceiling is no less than 60ft. Another feature of the design is the lighting arrangements. The pillars supporting the aisles are so close together as to hide the aisle windows from anyone not directly opposite them, and the curious effect is produced of the building being filled with a flood of light, while from either end no windows are visible. The narrow aisles are intended solely for processional purposes. The masonry is of red granite, in small oblong blocks, by which is secured a pleasing effect. The cost of the building is about £5000.

AVONMOUTH.—The first instalment of Messrs. Elder, Dempster and Co.'s cottage building scheme at Avonmouth is now completed. The rank consists of a dozen houses, designed by Mr. Bligh Bond, and fronting what used to be known as Green Lane. Each house has a parlour, a living room, a scullery and bathroom on the ground level, and three bedrooms on the upper floor. Each plot of land is 17ft. wide by 100ft. deep. Other houses are to be built on the same side of the street, and additional land has been secured on the other side of the way for further buildings.

BATTERSEA, S.W.—Probably there is not in all southern London a more uninteresting district than that part of Battersea which lies between York Road and the river. There, however, amid the unlovely streets and houses about half-way between Battersea and Wandsworth bridges, the Gonville and Caius College, Cambridge Mission and Settlement have built a new church and mission at a cost of £4000, years ago. In October of 1892 the ground floor of a fairly large building, called Caius Hall, was completed, and now the new church has just been dedicated by the Bishop of Rochester. The church stands over the hall, the latter now forming a kind of crypt for it. The church consists of a broad single-span nave and a chancel considerably narrower, with an organ chamber and vestry beneath. The church is of brick with stone dressings, and is in the Geometric Gothic style—plain in design but pleasing in its simplicity and its proportions. The architects are Messrs. W. and C. A. Bassett Smith, of the Adelphi, W.C., and the builder is Mr. W. Hammond, of York Road, Battersea.

BIRMINGHAM.—The laying of a memorial-stone in the new church in course of erection at Stirchley took place on Saturday week. The site of the new church abuts on the High Street. The church has been designed in the later decorated style of Gothic architecture, and consists of a nave 82ft. long by 35ft. wide in the clear, with north and south ambulatory aisles, each having five bold but low arches from the nave. The chancel will be 32ft. 6in. by 22ft. On the south side of this will be the clergy and choir vestries, the latter being carried up as a tower, in which will be the organ chamber over the vestry; and again, above the organ chamber, will be a ringing loft and belfry large enough for a peal of eight bells. At the western end of the nave, and connected to it by a triple arcaded and traceried opening, will be the apsidal-shaped baptistry, and north and south porches and inner porches, and above the triple arcade will be a large window. Over each of the nave arcades there will be ten two-light traceried windows, and carved corbels and shafts supporting eleven hammer-beamed principals and intermediates, having traceried spandrels; while bold flying buttresses, whose arched

soffits will be visible inside the shallow aisles, will stiffen the walls carrying the wide spanned roof. The chancel will have a seven-light east window, and two windows of two lights each on the north side, and one on the south side. The roof of the chancel will be wagon-shaped, and divided by ribs into panels. All the walls will be built of brick throughout. The external dressings are to be of red terra-cotta, on account of its greater durability than stone in a manufacturing district, and the internal piers, arches, and other dressings will be in selected Farleigh Down Bath-stone. In the architect's design a morning chapel, on the north side of the chancel, was shown, but this is not being carried out at present. A vault for the heating apparatus is provided in the tower basement. Mr. William Hale is the architect, and Mr. Thomas Smith the builder.

BRISTOL.—Many new factories have of recent years been erected in various parts of the city and its suburbs. One of the largest of these is that of Messrs. Watham, Gardiner, and Co., clothing manufacturers. The whole of the main building, which measures 210ft. by 150ft., is lighted from the roof on the North light principle, using upwards of 13,000ft. of plate glass set in steel bars. The roof is supported on iron columns, with light steel trusses and framing. Entering by the main hauling way the offices are on the left, and in front is a corridor running through the centre of the factory, from which all the rooms can be inspected and approached. The whole building is warmed by a hot-water apparatus, supplied by Messrs. Crispin and Sons. The elevation is generally of pennant stone, with Cattybrook brick dressings and cornices, the central block being entirely of brick, with Broseley tile roof. The general contract has been carried out by Messrs. Cowlin and Sons, and the engineering by Mr. G. Tuckey. The architects for the whole of the works were Messrs. La Trobe, F.R.I.B.A., and Weston, of 20, Clare Street, Bristol.

CARDIFF.—A new church in Albany Road has just been opened. The building gives seating accommodation to close upon 1000 worshippers, and has been erected at a cost of £6800, the contractors being Messrs. E. Turner and Sons, and the architects Messrs. Jones, Richards, and Budgen. In addition to the church, the building comprises two large parlours, four spacious classrooms, and other offices. The building generally has a very light appearance with plenty of window space, filled in with nicely-tinted cathedral glass. The roof is curved with massive ribs at intersection of nave and transept, these resting on stone pilasters. The carving in the treatment of the base of these is very effective and forms a feature of the building. The remainder of the roof is panelled, the colouring of which is pleasing and warm. The chapel is heated with hot air, the apparatus being supplied by Messrs. Langfield and Co. Limited, of Manchester, whose method of ventilation has also been adopted. The building has been constructed with Newbridge stone, with Bath stone dressings.

COLCHESTER.—The complete list of builders' tenders for the erection of the new Town Hall at Colchester, in Portland stone, we understand to be as follows:—George Dobson and Sons, Colchester, £46,270; F. Dupont, Colchester, £44,975; Everett and Sons, Colchester, £44,135; Lawrence and Sons, City Road, £43,114; Platman and Fotheringham, £40,350; William Downes, £39,820; John Shillito and Son, Bury St. Edmund's, £39,492; W. Chambers, Colchester, £38,446; John Thompson, Peterborough, £38,028; Grimwood and Sons, Sudbury, Suffolk, £37,294; W. Pattinson and Sons, Parliament Street, London, S.W., £36,292; and Kerridge and Shaw, Cambridge, £34,214 (accepted). With certain necessary additions, Messrs. Kerridge and Shaw's tender will total about £35,000, and it may be mentioned that the estimates do not include the erection of the upper part of the Victoria Tower.

FECHNEY.—The directors of the Industrial School are erecting a new entrance gateway and lodge at this school in the Glasgow Road. It was designed by Mr. David Smart, architect, 8, High Street. The contractors are:—Mason work, A. Beveridge; joiner, D. Crichton; slater, J. Buchan; plumber, Frew and Sons; and plasterer, John Peebles—all of Perth.

LONDON, E.C.—Considerable structural alterations have recently been made at the London offices of the Caledonian Fire and Life Insurance Company. The offices are situated in King William Street. The alterations have mainly taken place in the life department of the office, and consist of the removal of heavy cross walls and a stone staircase from the ground floor, and the substitution of an internal mahogany staircase leading from the general offices on the ground floor to the secretary's and other offices situated upon the first floor. The new life office has been refitted with handsome mahogany counters and fittings. The premises have been heated by low pressure hot water by Messrs. Edwards and Son, of Great Marlborough Street. The general contractors for the works were Messrs. Thompson and Beveridge, of Albany Street, N.W. The alterations were designed and carried out under the personal supervision of Mr. Howard Chatfield Clarke, of Bishopsgate Street Within.

METTINGHAM.—The parish church of Mettingham has been re-opened by the Bishop of Norwich after the completion of extensive restoration. The church is of Norman style, and stands on a commanding eminence. Some idea of the nature of the work of restoration may be gathered from the details which are appended. The whole of the exterior, flint and stone work has been restored and made good, the old flat tiles on the roof have been replaced with slates, and the lead on that part over the nave and aisle has been taken off and re-cast. As regards the interior of the edifice, this has been entirely re-seated in pitch pine, and in the chancel two seats have been added, and their carved oak fronts considerably lengthened. The old brick paving has been removed, and a wood block floor laid in its place. The spars in the roof over the aisle, which were formerly naked, are now covered with panelled oak lining, and the under side of the bell-chamber floor has also been panelled and moulded. On the south side, the lobby entrance has been converted into a vestry, laid with wood block flooring, the old vestry, which was found to be most unsuitable, having been pulled down. At the north entrance a lobby has been added having a loose panel in the roof for ventilation. The windows have all undergone treatment. Some have been renewed and others restored, whilst those which had formerly been bricked up have been opened out, and all have been re-glazed with square clear glass in a steel-coloured border, giving the interior a very light and cheerful appearance. The walls have been re-coloured, and the oak-work cleaned and oiled, and the church is now effectually warmed by a heating apparatus on the hot air principle by means of one of Porritt's air warming underground stoves. During the progress of the work, two piscinas were discovered, one in the chancel and one in the south aisle. They must have been built up a great many years, but they have now been re-opened, and are considered very beautiful. The whole has been carried out by Mr. A. D. Botwright, builder, of Bungay, from plans and specifications prepared by Mr. W. A. Coombs, architect, of Charing Cross, London, the contract price being £609.

NORTH SHIELDS.—The Queen Victoria School, situated in Lovaine Place West, North Shields, the latest addition to the educational establishments erected by the Borough of Tynemouth School Board, has been formally opened. The buildings consist of eight classrooms, capable of seating sixty children in the mixed department, and in the infants' department, seventy-two. The present buildings form only two-fifths of the whole scheme. Playgrounds and sanitary arrangements have been provided for the complete school, for

1350 scholars. Externally, the schools are well-proportioned and pleasing. The designs for the school were prepared by Messrs. Marshall and Dick, architects, whose plans were selected in competition for the work, and the contract for the buildings has been carried out by Mr. Joseph Elliott, of North Shields, while the heating apparatus has been supplied by Messrs. Emley and Sons, of Newcastle. Messrs. Doulton, of London, supplied the terra-cotta. The clerk of works was Mr. W. Moore, the superintendent architect being Mr. C. T. Marshall, M.S.A., of Newcastle and North Shields.

PERTH.—Under an Act of Parliament, procured about five years ago, the Police Commissioners of Perth got authority to make a new street from South Street to Mill Street in line with Kinnoull Street and Scott Street. Among the public buildings already erected are the Post Office, the Sandeman Public Library, and the Wilson Church. One of the most striking of the buildings in the street is rapidly approaching completion. It is situated at the corner of South Street and Scott Street, and is a four-story tenement of shops, offices, and dwelling-houses. The style of Architecture is Classic. The first-floor windows are ornamented with Corinthian pilasters and pediment, while the top story is surmounted by a large cantilever cornice and the attic windows have ornamented pediments. The treatment of the corner takes the form of an ornamental oriel window. The building was designed and erected under the personal superintendence of Mr. David Smart, architect. The contractors were:—Mason work, Robert Brand and Son; joiner work, Leith and Lumsden; slater, James Buchan; plumber, James MacLeish; plasterer, John Mackie—all of Perth.

Enquiry Department.

SOUND-PROOF FLOORING.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Can you kindly inform me of the best method for preventing sound passing through a floor? Eleven inch deals are used to carry the floor, and 1½ in. by 3½ in. floorboards—which are not yet fixed—with a lin. counter floor, half way through the joists, nailed to slips, nailed on joists.—Yours truly, R. S.

The method suggested would suffice, especially if the space between the counter boarding and the floor proper were filled with slag wool.

Correspondence.

GODALMING COMPETITION.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I should like to point out to your Special Commissioner that the conditions do not require the fixtures to be shown in either the Court Room or Council Chamber, and therefore the conditions have not been extravened, but, on the contrary, the reply to question No. 4, states "the floor should be capable of being cleared," and it was so shown by yours truly,

THE AUTHOR OF No. 3.

November 23rd, 1898.

London, E.C.

AN ANTIQUARIAN FIND.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—The notice in your paper as to the seal found at Selby Abbey reminded me that a few years ago, when at Scarborough, whilst wandering round the Castle Hill, I picked up an old bronze seal, very much coated with verdigris. By the lettering, I should say it is about the same period as the Selby find. Canon Raine greatly admired it, and translated the inscription: "Sⁱ Johis ad Ecclesiam" (The Seal of John of the Church). There are two or three similar seals at the museum at York.—Yours truly, J. T. P.

York.

Under Discussion.

THE ARCHITECTURAL ASSOCIATION.

On last Friday a meeting of the Architectural Association was held at 9, Conduit Street, W., Mr. G. H. Fellowes Prynne in the chair.—A vote of thanks was passed to Mr. Batsford for presenting several new books to the library.—Messrs. L. Blank and A. Woodroffe were elected members.—Mr. Paul Waterhouse's paper upon "Oriel and Bay Windows" (which we publish elsewhere) was well received, and in the discussion Messrs. E. A. S. Stokes, F. T. Baggallay, H. H. Statham, Alexander Payne, Thomas Blashill, H. A. Satchell, and G. H. Fellowes Prynne took part.

BRITISH ARCHEOLOGICAL ASSOCIATION.

The second meeting of the season was held at the rooms in Sackville Street, Piccadilly, a few days ago; Dr. Winstone in the chair.—Mr. Andrew Oliver exhibited the remains of a sword and a small knife, together with the boss of a shield, which were found with three skeletons at Portslade, near Brighton, in July last, in the formation of a new road. The opinion of the meeting was that the exhibit belonged to the Roman-British period.—Mr. Gould exhibited another photograph of the Roman pavement at Leicester, which has already been illustrated in the Journal of the Association, and read some additional details regarding it, bringing out the interesting fact that the houses recently demolished, under which the pavement was found, occupied the site of a house once the residence of John Bunyan.—A paper on Wool Church, Dorset, by Dr. Fryer, was read in the author's absence by the Rev. H. J. W. Astley, hon. secretary. One of the principal features of this church is the chancel arch, of the thirteenth century date, which is, perhaps, unique for that period. The unusual and effective appearance of this arch is produced by the filling up of the large arch, and piercing the wall with three arches of equal width, each 10ft. 6in. high and 3ft. 6½ in. wide. These three sub-arches rest upon shapes of octagonal form, 32in. in circumference, without capitals and with base moulds near the floor. The tympanum is quite plain, with no trace of decoration, although it is quite likely this was originally intended. The church also possesses a font of the fifteenth century of special interest, as it was evidently purposely designed for its present position, against the westernmost pier of the north arcade of the nave. Fragments of cresset stones have occasionally been discovered in England, but Wool Church possesses one in almost as good a condition as when it left the hand of the mediæval mason. There is a tradition that the bells of Wool Church were stolen from Bindon Abbey at the dissolution, but this is contradicted by the bells themselves, as all of them are dated, the oldest being of the year 1606.—The first portion of a paper upon the Welsh Marshes, by Mr. C. H. Compton, V.P., was read by the author.

CONDITIONS WHICH RENDER HOUSES UNHEALTHY.

At the last meeting of the Glasgow and West of Scotland Technical College—Architectural Craftsmans' Society—a paper by Mr. James I. Little, sanitary inspector, was read on the above subject. In considering his subject, the lecturer first named the three essentials for a healthy life—light, air, and water; and contrasted in several ways the conditions of town and country life, noting, for example, the impure air in the town and the bad water in the country. He then treated of various evils in our towns, such as the centralisation of buildings causing smoke, and from that fog, which assists the growth of bacteria by shutting out the blue sky. Building on free coups and damp soil, porous stones, curtained windows, dark inside stairs, untidy offices, defective drainage, lack of ventilation, and free space were several of the innumerable conditions which cause unhealthy houses.

TENDERS.

ABERDEEN.—For the erection of school buildings, Six Bells, for the Llanhilleth School Board. Messrs. Swash and Bain, architects, Midland Bank-chambers, Newport, Mon. Quantities by the architects:—

Tenders, endorsed "Tender for Tracery, &c., are to be addressed to the Chairman of the Burial Committee, and delivered at the Town Clerk's Office before NOON on MONDAY, DECEMBER 5th, 1898.
The Corporation do not bind themselves to accept the lowest or any Tender.
By order,
Town Hall, Hull, A. E. WHITE,
November 21st, 1898. City Engineer.

HALL'S - SANITARY - WASHABLE DISTEMPER (PATENTED),

A NEW SANITARY WATER PAINT, HAS great advantages, some of which are as follows:

- It Sets Hard, Kills Vermin, and Disinfects.
- It is Washable in 3 Weeks, Does not Scale, can be Painted or Varnished, and will Stand Inside or Outside.
- It is made in Dark Rich Shades as well as in Light Tints, contains no Lead, and Does Not Turn Black. It only requires the addition of Water to make it ready for use, so that anybody can apply it.
- It is Cheaper, Cleaner, Healthier, and more Artistic than Wall Paper.

It is Sold by leading Chemists, Drysalers and Ironmongers, and Manufactured by
SISSONS BROTHERS AND CO. Limited, HULL,
From whom Samples, Shade Card, and other particulars can be obtained.
FOREIGN AGENTS WANTED.

From 31n. to 201n. deep.

**COUNTY BOROUGH of WEST HAM.
TO BUILDERS AND CONTRACTORS.**

The Council hereby invite TENDERS for the ERECTION of QUARTER SESSIONS COURT, POLICE CELLS, and MORTUARY, West Ham-lane, Stratford, E.

Plans may be seen, and specification, form of Tender, and further particulars obtained, on and after MONDAY, NOVEMBER 28th, 1898, at the Office of Mr. LEWIS ANGELL, Borough Engineer, Town Hall, Stratford, E., upon the deposit of a Five Pound Bank of England Note, which will be returned upon receipt of a bona-fide Tender.

Tenders, endorsed "Tender for Quarter Sessions Court, &c.," to be sent to my Office not later than FOUR o'clock on TUESDAY, DECEMBER 13th, 1898.

The Council do not bind themselves to accept the lowest or any Tender. The Contractor will be required to enter into a bond, with two sureties, for the due performance of the contract, and no work will be ordered under the contract until such bond has been duly executed.

As regards all work to be done at the site or elsewhere within a radius of twenty miles from Charing Cross, the contractors will be bound by the contract to pay to all workmen (except a reasonable number of legally bound apprentices) employed by them wages at rates not less, and to observe hours of labour not greater, than the rates and hours set out in the Council's list, and such rates of wages and hours of labour will be inserted in and form part of the contract by way of schedule.

By Order of the Council,
FRED. E. HILLEARY,

Town Hall,
West Ham, E.
November 15th, 1898.

RAINHAM (Essex) PARISH COUNCIL.

The Council invite TENDERS for the ERECTION of a small CHAPEL, BOUNDARY FENCING, CONSTRUCTING ROAD and PATHS for the proposed new Cemetery at Rainham.

The drawings, specification, and form of contract can be seen at the Office of the Council's Architect, Mr. C. J. DAWSON, F.R.I.B.A., Barking, Essex, between the hours of TEN a.m. and FOUR p.m., and on Saturdays from TEN a.m. to ONE p.m.

Forms of Tender and bills of quantities may be obtained at the Architect's office on payment of £1 ls., which will be returned on receipt of a bona-fide Tender.

Tenders to be delivered at my Office by FOUR o'clock p.m. on DECEMBER 8th, 1898, endorsed "Tender for Cemetery."

The Council do not bind themselves to accept the lowest or any Tender.

The Contractor will be required to enter into a bond, with two sureties, for the due performance of the contract, and no work will be ordered under the contract until such bond has been duly executed.

THOS. CAPRON,
Grays, Essex,
November 21st, 1898.

CORPORATION of MANSFIELD.

The Town Council, acting as the Urban Sanitary Authority for their District, are prepared to receive TENDERS from competent persons for the CONSTRUCTION of about 500yds. of 9in. PIPE SEWER, with all the necessary lampholes, manholes, ventilators, flushing arrangements, and works incidental thereto.

Plans and specifications of the work may be seen, and the form of Tender and schedule of quantities obtained (on deposit of £2) at the Office of Mr. R. FRANK VALLANCE, C.E., F.S.I., Borough Surveyor, Mansfield, the Engineer for the Works, on and after DECEMBER 1st next.

The deposit will be returned after a contract has been entered into to every person making a bona-fide Tender, and on the return of the documents entrusted to him.

In the event of a Tender being withdrawn the deposit will be forfeited.

The successful contractor will be required to pay the standard rate of wages recognised in the district in the several trades.

Sealed Tenders, on the form supplied, endorsed "Tender for Outfall Sewer, Littleworth," are to be delivered at the Office of the undersigned, in the envelope provided for the purpose, on or before DECEMBER 14th, 1898, at NOON.

The Town Council will not be bound to accept the lowest or any Tender.

J. HARROP WHITE,
November 17th, 1898.

Deputy Town Clerk.

**PARISH of ST. PANCRAS, LONDON.**

TO BUILDERS.

The Guardians of the Poor of the Parish of St. Pancras are prepared to receive TENDERS for the ERECTION of TWO CHAPELS at the Workhouse, King's-road, St. Pancras, according to drawings and specification, which may be seen at the Offices of the Guardians' Architects, Messrs. A. and C. HARSTON, 15, Leadenhall-street, E.C., on and after THURSDAY, DECEMBER 1st, 1898.

Bills of quantities have been prepared by Messrs. CORDEROY, SELBY, and CORDEROY, and Mr. W. F. FARTHING, and may be obtained, at the Offices of the Architect as above, upon payment of a deposit of Five Guineas, which amount will be returned to persons sending in a bona-fide Tender with the priced bills of quantities.

The Guardians do not bind themselves to accept the lowest or any Tender.

Tenders, sealed and endorsed "Tenders for Two Chapels," must be delivered at the Offices of the Guardians, Vestry Hall, Pancras-road, N.W., not later than THREE o'clock p.m., on THURSDAY, DECEMBER 22nd, 1898.

By order,

ALFRED A. MILLWARD,

Clerk to the Guardians.

Vestry Hall,

Pancras-road, N.W.

November 21st, 1898.

INTRODUCTION OF NON-FLAMMABLE WOOD INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to
Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"IOWA" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARITTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.

"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known
colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING,
(each of which is over eighteen stories high).

"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company
by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,
2, Army and Navy Mansions, Victoria Street, London, S.W.

THE CONSTRUCTION OF HOSPITALS For Consumption and other Infectious Diseases.*

By DR. JOHN W. HAYWARD.

(Continued from page cxxv.)

IN order that the patients may have as much sunshine as possible, there should be numerous windows, and the window openings should be well splayed both inside and outside, so as to admit as much sunshine as possible with as little glass as possible; large windows have a very cooling effect.† And, further, to ensure this, the pavilions should not be more than two stories in height.‡ Small hospitals may be composed of two, three, or four pavilions, but large ones may require quite a number.

For consumptive patients, especially, warmth is quite as essential as fresh air and sunshine; it is, perhaps, more difficult to provide, because of the varying temperature of the different seasons of the year, and the difference between day and night. In this climate, Nature does not supply sufficient warmth for the health and comfort of invalids much more than three months in the year; for at least eight months' warmth has to be procured by artificial means; that is, by the combustion of fuel, in either firegrates or furnaces. Small wards may be warmed by open fires, with the Pridgeon Teall grate; but corridors and large wards require hot water or steam pipes, which, in order to distribute the warmth in the vicinity of the patients, should be run round, or partially round, the ward, about a foot above the floor, as many times as will be required to keep the ward up to 65 deg. F. at Christmas; this is much preferable to coils, even over the inlets. The furnaces should be in the basement, and attended to by the porter—a furnace for each wing. It would indeed be well to have even small wards warmed by pipes, because of the many objections to open fires.§

HEALTH AND COMFORT IN HOUSE BUILDING, 3rd Edition, 1890.—E. and F. N. Spon, 125, Strand, London.

* A paper read before the Liverpool Architectural Society on Nov. 7th, 1898.

† "Long wards," says the writer in the *Encyclopædia Britannica*, "should have windows down each side, and perhaps one at the further end; if possible a window for each patient; never less than one for every two beds. . . . There should be free play of sunlight upon each ward during at least some portion of the day." (loc. cit.) "The cooling effect of each square foot of glass of an ordinary window," say the authors of "Health and Comfort," "is equal to the cooling down of a cubic foot of the air of the room to the temperature of the external air." (p. 77.)

‡ "The space between the pavilions," says the writer in the *Encyclopædia*, "should be at least twice that of the height of the pavilions, so that there may be the freest possible circulation of air around them, and no cul-de-sac or enclosed space where air can stagnate." (loc. cit.)

§ For hospital wards open fires are risky, costly, and troublesome; they greatly embarrass all plans of ventilation, and are in many other ways objectionable—they radiate heat only from isolated and distant centres, and cannot warm wards at all equally; they are noisy and dusty and require frequent attendance, and this disturbs the patients' sleep and rest; besides, the warmth they supply varies with the nurses' attendance to them, and is sometimes much, sometimes little. They are of but little use as means of ventilation; they certainly abstract air, but they take it principally from near the floor, whereas the foul air accumulates near the ceiling, being heated and so made light by the same means that foul it. Hospitals warmed only by open fires are sure to be very imperfectly warmed; and if at the same time they are attempted to be ventilated only by open windows they are most certainly also very imperfectly ventilated. It is much to be regretted that some hospitals are professed to be ventilated and warmed by simply open windows and open fires, even throughout the winter in this climate; and if the inefficiency of open fires be hinted at, appeal is made to the thermometer hanging in the ward, to show that the ward is sufficiently warm—that is, is not under 60 deg. F. Now, if the outer air be below 32 deg. F., and is coming into the ward directly through open windows at the rate to change the whole air of the ward every twenty minutes, it is absolutely impossible it can be warmed up to 60 deg. F. in the vicinity of the patients by open fires. If, therefore, a properly placed thermometer registers 60 deg. F., this is of itself proof positive that the air of the ward is not being changed every twenty

Special provision should be made for the admission of abundance of fresh air at all times, in winter as well as summer, at night as well as in the day time, and in both wards and corridors. "Another great cause of the mortality in hospitals," says the writer in the *Encyclopædia*, "is the want of efficient ventilation" (loc. cit.). By "ventilation" is meant the continuous removal of the air that has been used, and the replacing of it with fresh air that has not been just used. There is some difficulty in doing this satisfactorily in our climate, because of the varying temperature of the different seasons of the year. It requires to be considered in relation to (1) summer, (2) spring and autumn, (3) winter, because the arrangements for one of these seasons are quite unsuitable for either of the others. It should also be considered in relation to the three parts of the twenty-four hours for the same reason, that is (1) daytime, (2) morning and evening, (3) night; also in relation to the number of persons in the hospital. The ventilation should, therefore, be completely under easy control, that is, susceptible of being easily increased or diminished according to circumstances, or be shut off altogether if necessary.

FOR SUMMER.—Perhaps the best provision for ventilation during summer—in the daytime, at any rate—is to have a pane of about 15in. deep across the top of the windows, hinged at the bottom so as to open inwards; the openings to have side flanges and bevelled lintel, so that the incoming air shall be directed upwards towards the ceiling; and, in this case, the top of the window should be square and about 18in. below the ceiling (see Plan A—a). These window openings should be so under control as to be easily opened and closed, according to the temperature of the outer air and the way of the wind. Also, the windows should be so made that the lower sash may be raised 4in. and the bottom be closed by blocks, hinged to the frame outside; and the frame inside should be made 6in. deep at the bottom, so that the lower sash may be raised and the bottom remain closed, so as to let in the air only between the two sashes, and direct it upwards. By these means, the incoming air will be prevented from rushing straight on to the beds (see plan A—a.b.) When the air is being let in through the windows all other (all special) inlets to the wards should be kept closed, and the ward door shut. It should also be remembered that open windows afford efficient ventilation only when there is sufficient movement of the outer air; on hot sultry days, when the air is comparatively motionless, they are of little use in the way of ventilation; for such times some means that will cause the air to move are necessary.

FOR WINTER, and for spring and autumn, and for most nights even in summer, the outer air in our climate (and more so in countries such as Canada and Russia) being generally too cold to be admitted through open windows, it must be let into the wards out of the corridors, where it is warm. It is, of course, impossible to warm the air as it enters, before it impinges on the patients, when it is let in through open windows and the warming is done by open fires, because the patients lie between its entrance and the means of warming.* The

minutes—that is, that the ward is not being sufficiently ventilated. It is preposterous to maintain that one open fire can warm sufficiently a ward even for only ten patients—40ft. long, 25ft. wide, and 13ft. in height—that is, can raise 13,000 cubic feet of air from 32 deg. or lower up to 62 deg., whilst the air is passing in and out at the rate of the whole being renewed every twenty minutes. "In point of fact," say the Government Commissioners, "it is not to be expected that one small fire can maintain 10,000 cubic feet of air at an equable temperature when it is required to heat every minute from 3000 to 4000 cubic feet, one degree in addition to that cooled by the walls, as well as to heat all required for ventilation." "Blue Book," p. 64. And in a new "Blue Book," issued in 1898, "On the Ventilation and Warming of Board Schools," on p. 23, occurs this statement, in reference to ventilation by open windows:—"In those cases in which the ventilation was effective the temperature of the dormitory would follow closely that of the outside air, and would not exceed that of the outside air by more than about 2½ deg."

* "In our climate," say the authors of "Health and Comfort," "openings from the open air cannot be endured; nor can doors or windows, except on rare occasions, be left open even in the day and never in the night without risk . . . the admission of cold air is particularly dangerous during sleep." (pp. 3, 10.)

air may be let into the wards out of the corridors by openings through the bottom of the wall, and through the doorways; these should both be at the further side of the ward from the fire and the outlet. The special opening to each single bed ward should have an area equal to 15in. square, the openings on the upper storey being a little larger than those on the lower, because of the increase of obstruction. These openings should be under easy control by shutters.* With reference to winter ventilation, the writer in the *Encyclopædia* says:—"The fresh air should be brought in at the lowest part of the ward" (see plans A—c, B—a, C—a). If this passing of the air straight out of the corridors into the wards should be thought to be objectionable or found to be felt as a draught, the air may be carried 6ft. up inside the ward by a round cornered zinc or wooden tube on the Tobin plan, the terminal end being covered with wire grating, to prevent the patients from blocking it up. This plan should certainly be adopted for the convalescent rooms, a tube on each side of the doorway. These special inlets out of the corridors should, theoretically, be sufficiently large to give passage to the air required for all the purposes of the ward; that is, for the patient, the nurse, the gaslight and the fire; practically however—seeing that the nurse is not always in the ward, and the gas is used only at night, and the fire only in cold weather—the special openings need not be larger than 15in. square, for single-bed wards, for if the air in the corridors be sufficiently warm the door may generally be left partially open, and so be used as the principal inlet; as a matter of fact, indeed, the door is seldom shut. The quantity of air required for the patient, the nurse, and the gaslight is about 20 cubic feet each per minute, and for the fire 600 cubic feet, that is, for all the purposes of the ward, 40 cubic feet per minute in the daytime; 60 cubic feet when the gas is lighted, and 640 cubic feet when also the fire is burning. Of course the supply for the fire need not be provided for when the ward is warmed by pipes. The corridors should be supplied with fresh air in such quantity as to cause the air to move into the wards whenever the doors are opened; this will tend to prevent the air of the wards spreading throughout the hospital every time the doors are opened; letting the air in through the windows tends to drive the air of the wards into the hospital, which is always objectionable; and is also risky when there is infectious disease in the wards. In winter this supply should be obtained through the basement, by gratings in the floors of the corridors, as shown on Plan A—d, j, B, C.

The temperature of the air in the corridors should never be allowed to fall below 65deg. F., in order that its movement into and through the wards may not be felt as a draught; if it be at all below 65deg. it is sure to be so felt, and if possible be prevented from coming in; that is, the openings will be closed and the doors shut, whenever possible; at all events in hospitals for consumption.†

So much for the supplying of fresh air; what about the removing of the foul?

The air of the wards, after having been used, should be abstracted and replaced with fresh.

The rule on this point is that the whole of the air of the ward shall be abstracted and the ward replenished every twenty minutes; and that this shall be continuously going on at all times, day and night, winter and summer alike. Now, the regulation provision being at the very least 1000 cubic feet of air space for each patient, this means the removal of at least 1000 cubic feet of air out of the ward every twenty minutes, or fifty every minute for each patient. How shall this be done? In summer,

* These shutters should be on the corridor side of the wall, and be made to slide up and down on pulleys like the lower sash of a window.

† In all hospitals indeed it is to be expected that openings which let in cold air would, if the patients had their way, be closed on every possible occasion, and with reason, because in persons debilitated from exercise, the circulation and the chemical and vital changes of the body, become so languid that invalids are adversely affected by movements and conditions of the atmosphere that persons in health and activity do not feel at all.

in the daytime at any rate, it is not difficult of accomplishment by open windows alone, when there is sufficient movement of the outer air, as the windows can be opened to almost any extent; nor is it difficult in winter by the fires alone, when these are burning, as each fire takes away 600 cubic feet of air every minute.* In spring and autumn, however, it is somewhat difficult to accomplish satisfactorily, because the weather is then generally too cold to have the windows always open and yet not cold enough to have the fires continually burning, so that the abstraction cannot then be accomplished efficiently by either windows or fires; it must consequently be done by outlets specially provided for the purpose. "The foul air," says the writer in the *Encyclopædia*, "should be taken out at the highest part of the ward."† These outlets should then be in the wards, in or near their ceilings; and the best place for them is by the chimney breast, to lead into flues run up the chimney stack by the side of the smoke flue, as the Government Commissioners point out. (see plans on page cxxiv. and cxxv., A—e, C—b.) There must be a separate flue from each ward, they should lead straight to the outer air, and be capped by a Boyle's abstracter.‡ They must be somewhat tapering, that is, the first length must have an area for each single bed ward equal to a foot square, and the terminal length an area equal to only one-third of a foot square; they should be made of earthenware, glazed inside, circular or with rounded corners and without abrupt bends or angles, so that they may be easily and frequently cleaned out, so as to leave no risk of germs lodging in them to be driven back into the ward should unfavourable circumstances ever cause a puff of draught; that is, should there ever be at one and the same time closed inlets, motionless outside atmosphere, and strong draught up the ward chimney. These are, however, very seldom likely to occur all at the same time. These outlet flues should be sufficiently capacious to give passage to all the air of the wards in twenty minutes, when the speed in them is not greater than 6ft. per second, because the ventilation may at times depend principally on these outlets.

To the plan of abstracting the foul air near the floor, as advocated by Mr. Smead, of America, there are at least four grave objections: (1) It is opposed to Nature's law of atmospheric pressure, and therefore requires the use of special abstracting power by means of furnaces for its accomplishment; (2) By drawing down the foul air it causes it to be breathed over again, which recently breathed air ought never to be; (3) The fresh air supplied is apt to be forced in overheated, in fact burnt, and so made unhealthy; (4) The long tortuous abstraction flues cannot be kept clean, and will therefore become lurking places for dust and germs. The plan is quite unsuitable for hospitals, and should certainly never be used where there is likely to be infection. Besides, it is also open to the

same objections as ventilation, by open fires, viz., that it tends to draw away the air of the lower part of the ward, where it is always the least impure. Moreover, the slight tendency of the thin layer of air in contact with the outer walls to fall downwards, is no demonstration that the mass of foul air over the centre of the ward should be attempted to be drawn down, in order that it may be taken out at the bottom. "The method of low ventilation," says the Government Commissioners, "should be avoided on various grounds. . . . The heated air which passes upwards, should pass away." (Blue Book, p 4—bottom—pass 30). The plan certainly economises warmth, but it does so only at the expense of the ventilation, that is by the heated foul air not getting away.*

But the abstraction of the foul air cannot be effected by either low or high ventilation, unless at the same time an equivalent quantity of fresh air is being continuously supplied. How shall this supply be procured? Of course, as it cannot in winter be through the ward windows, it will have to be out of the corridors, and the corridors will have to be supplied with an equivalent quantity; and as this cannot be through their own windows, because that would let in cold air, its entrance will have to be provided for otherwise. The best, and perhaps the only feasible way, is that it shall be let in through the basement and allowed to pass up through gratings in the corridor floors, along the sides of the whole length of the corridors, as shown on Plans A B C; it can be then let into the wards either by special openings through the wall or by the doorway, as already mentioned.

Now, inasmuch as in the foregoing arrangement, the foul air flues pass directly from the wards to the outer air, fear may be entertained that the outer air will pass down them into the wards just as it will pass into the wards through open windows. The cases are, however, not parallel; windows afford merely cold openings, whereas the special outlets are tapering tubes, and are somewhat warm. Besides, open windows do not always let in the outer air; in cross ventilation the open windows on the leeward side of the ward act as outlets; when open windows on one side act as inlets, those on the opposite side must act as outlets. The flues, too, being at a higher level and warm, and the air at their mouths being warmer than that entering by the inlets, they must act as outlets; and particularly if the flues themselves are large at the bottom and small at the top like factory chimneys, and there is—as there should be—also continuous ample supply of cooler air flowing into the wards at a lower level (see plan A—e.g.); practically this is found to be the case. Nevertheless, the mouths of the flues in the ward ceilings should be provided with valves, as a safety against adverse circumstances; and their terminal ends outside may be protected by Boyle's air pump ventilators, which, as well as the last length of the outlet flue, must have an area equal to only 4in. square, for each single-bed ward, and must reach somewhat higher than the smoke flues.† The chimney throats also, as well as

being as large as possible, should be provided with shutters for use when the fires are not burning, and the top of the flues with small chimney pots, so as to ensure the top being of much less area than the bottom. In ordinary chimneys, when properly constructed, there is almost always a updraught, even without fires—that is, if air is passing into the room; and so, of course, there will be in the outer flues, when constructed on the same plan and with ample supply of air flowing into the wards. The whole hospital should be constructed on the same plan, viz., with large total inlets and small total outlets. (See Health and Comfort, p. 88, on the cure of smoky chimneys.)

During winter, and mostly in spring and autumn also, the supply of fresh air should be through the basement (see plan A—k.h.l.), and it should be warmed by the hot pipes as it rises into the ground floor corridor, up to the necessary temperature; that is up to 65deg. F. The whole of the basement of the pavilions should be used as fresh air and air warming chambers, their ceilings being about 6ft. above their asphalted floor for the convenience of cleaning out the dust and blacks deposited from the incoming air (see Plan A—h). The fresh air should enter the basement of the wards by openings through the outer walls, on each side of the pavilions (the primary inlets A—k), one for each ward. It should then enter the basement of the corridors (the air warming chamber) by openings through the wall on each side (the secondary inlets, A—b). Along the ceiling of this warming chamber, that is, underneath the ground floor of the corridors, the warming pipes should be distributed, being run backwards and forwards along the whole length of the corridor, in sufficient number to make sure of the air in the corridor being kept up to or above 65deg. F., when the outer air is considerably below freezing; and to ensure the air of the first floor corridor being of the same temperature, the necessary number of pipes should be run along near the cornice underneath the gratings of the corridor of the upper floor, as shown on Plan A. By this means the air will at the same time be dried, which greatly improves it for consumptive patients (see "Health and Comfort," p. 29). These pipes should be heated by a special furnace, that is, there should be two furnaces for each wing, one for warming the air of the corridors and another for warming the wards on each side of the corridor. The primary inlet openings should be near the ceiling of the fresh-air chambers, and the secondary ones about a foot above the floor, in order to break the directness of the current of the incoming air (see Plan A—k-l). The area of the primary and secondary inlets should be about 2ft. square for each single bed ward; that of the openings through the ground floor gratings equal to about 2½ft., and that of the upper floor about 3ft. The outside of the primary inlets should be protected by iron gratings; and the inside, as well as the outside of the secondary inlets, should be controllable by shutters to fall down or to slide down and up on pulleys, like the upper sash of a window, so as to regulate the quantity of cold air entering, or shut it off entirely if ever it should be desirable to do so (see Plan A—ka). Flanges, broader than the openings, should extend inwards over the top of the inside of the secondary inlets, so as to direct the incoming air towards the middle of the warming coil (see Plan A—l). If across these fresh-air chambers, or along the warming chamber, coarse woollen netting be hung, as in the ventilation of the Houses of Parliament, the air of the whole hospital will be filtered; and it may be disinfected, medicated, or perfumed at will.

(To be continued.)

preventers of down-draught; they are also real producers of up-draught, in consequence of the movements of the atmosphere forming a vacuum on their leeward side. The stronger the wind, therefore, the greater the up-draught or suction is likely to be. Any risk of down-draught through them is with a practically still outside atmosphere and somewhat of a vacuum at the mouths of the flues, from fires burning in the room, and little or no inlet of air. They are not here recommended as ventilators or means of abstraction, but merely as aids against down-draught.—See Building News, August 8th, 15th, 1890; June 26th, July 3rd, 1891.

* Unfortunately the air taken away by the fires is mainly taken from below the patient, whilst the foul air is above him; it is therefore disadvantageous rather than otherwise, as it diverts from him the air that is tolerably fresh and leaves to him that which has been fouled; in hospital wards and other inhabited rooms the air near the floor is always less impure than that near the ceiling, because the same means that cause it to rise also foul it. For this, and several other reasons, it is desirable that the fires shall not be used as ventilators, but shall themselves in all instances be supplied from a special and independent source, as recommended by the Government Commissioners. In hospitals constructed on the plan here advocated this could easily be done by flues from the fresh air chambers, terminating at sides of the grate near the floor, one on each side; their terminal ends being closeable by hit-and-miss gratings to regulate the supply, and their mouths by well-fitting valves to close them entirely when the fires are not in use.

† "While the air is in the lungs," say the Government Commissioners, "it acquires so much heat that it becomes specifically lighter than the surrounding air, and rises above our heads. . . . the heated air which passes upwards should pass away. . . . For the ventilation of rooms exits should be provided for the spent air near the ceiling, . . . to such an extent as to remove from fifteen to twenty cubic feet per minute for each occupant." (Blue Book, pp. 30, 94. See also Health and Comfort, p. 36; and Blue Book, p. 97.)

‡ If joined with others in a common shaft, not only will the abstraction be interfered with but any puff of down-draught may drive the foul air of one ward into other wards.

* It is a very mistaken notion that, because cold carbonic acid gas is heavier than atmospheric air, therefore carbonic acid is always to be found near the floor; in occupied rooms and hospital wards it is not cold but warm and therefore light, and with the other warm gases, rises towards the ceiling; besides, carbonic acid is not the only deleterious impurity. There are other more dangerous impurities, all of which, as well as the carbonic acid, are carried upwards along with the heated air. (Blue Book, p. 98.) Moreover, in an occupied room, with lights and a fire, the temperature of the air near the ceiling is generally over 65deg. F., so that air forced in below to rise above it and press it down towards the skirting abstraction, flues must be forced in at or above 70deg. F.; and, so heated, it is unhealthy, because burnt. Except the thin layer against the windows and outside walls, there is no tendency for the foul air to fall downwards, neither is it an easy matter to draw it down to the skirting board outlets; it requires indeed, strong and costly furnace power to do it. This plan of downward ventilation should never be used for hospitals, nor for anywhere else where there is heated foul air or infectious disease. (See Health and Comfort, pp. 10—top—26, 27—bottom.)

† It is essential that the outlet flues have a much less area at the terminal end than at the mouth, and that the mouth be able to be closed entirely or opened to the full extent—not to be closed by grating, but by shutter. Boyle's Air Pump Ventilators are not only very effective

LOW-PRESSURE STEAM IN DOMESTIC BUILDINGS.

By A. HUNTER CRAWFORD.

BELOW is a resumé of a lecture which Mr. A. Hunter Crawford has recently given before the Edinburgh Architectural Society, the Edinburgh Architectural Association, and the Glasgow Architectural Society. The lecture was given to the latter society so recent as the 22nd inst.

In order to give the notes as practical a basis as possible, a ground plan of a house, to cost about £3000, was shown, and the manner in which steam at say 5 to 10lbs. pressure could be utilised for heating and cooking, for hot water supply and for boiling water in the wash-house boiler, so that, if desired, there need only be the one central fire in the house for all purposes except roasting, toasting, &c. which might be done by gas cookers.

The plan showed dining-room, drawing-room, library, billiard-room, conservatory, kitchen, offices, &c., and it was taken for granted the building owner would prefer to retain the expensive cheerfulness of the open fire in all his rooms but that in those facing the north, in the billiard-room, in the hall and in the conservatory. A ready means should be provided for taking the chill off the air at any time of the year in the many damp or cold days in summer as well as in the frosty winter weather. A basement provided accommodation for the steam boiler, which could be either of the cast-iron sectional type, as made in America, or of the welded or boiler plate form, manufactured by English firms, the essential features being an automatic apparatus to regulate the furnace draught, in order that the steam pressure should not vary more than 1lb. at most. A safety valve to act should the pressure rise say 2lb. above the normal, and an automatic water supply from house cistern, with an alarm to sound should the water fall below its safe level.

From the boiler the steam would be led preferably on the "one pipe" system to the radiators, &c.

The main pipe to be taken to highest point A, and led by slight fall to automatic air cock at B, where it would descend below water level to boiler. As each radiator by this system has only one valve, the pipe to radiator must be of ample size to take the steam and also to retard the condensation. The two pipe method was also sketched. The radiators suggested were indirect radiators for the drawing-room,* direct radiators for the hall, and conservatory, the latter supplemented by pipes, and direct-indirect radiators for kitchen and billiard-room. A small steam heater would take the place of the kitchen boiler for heating the water which would circulate through a fifty to eighty gallon cylinder as usual, from which secondary flow and return pipes would be taken, or a steam coil could be placed at the bottom of the cylinder.

Steam rattle and air lock, and other faults common in steam and hot water installations, were shown on the model, which consisted of a steam boiler C, heated by a bunsen burner. The standpipe chamber D was connected to steam riser, and red water in D rose in the standpipe as pressure increased until it reached the level of syphon A, where it passed into the gas regulating tube and

closed the mouth of gas supply pipe, and, if pressure still increased, the small holes in the gas supply pipe were gradually cut off by the rising water until 1½lb. pressure was reached, when the gas admitted was sufficient to maintain a mere flicker in the bunsen burner. Should anything prevent the regulator working, the water in D would be discharged, before 2lb. pressure was reached, into cistern, and then there would be a free escape for steam from the boiler. This arrangement was a modification (to suit model) of that in use in Germany and other parts of the Continent, where the ordinary dead weight safety valve was not safe enough for domestic use.

Radiator R¹ was shown properly connected, but the automatic air valve might with advantage be placed higher, say in the middle of the radiator. R² showed a construction by which the steam was confined to the upper portion of the radiator, because the air, being heavier than the steam, lay at the bottom below level of air valve. R³ had a similar fault to R², but not to same extent, as the steam did not reach the air valve so soon as in the latter arrangement.

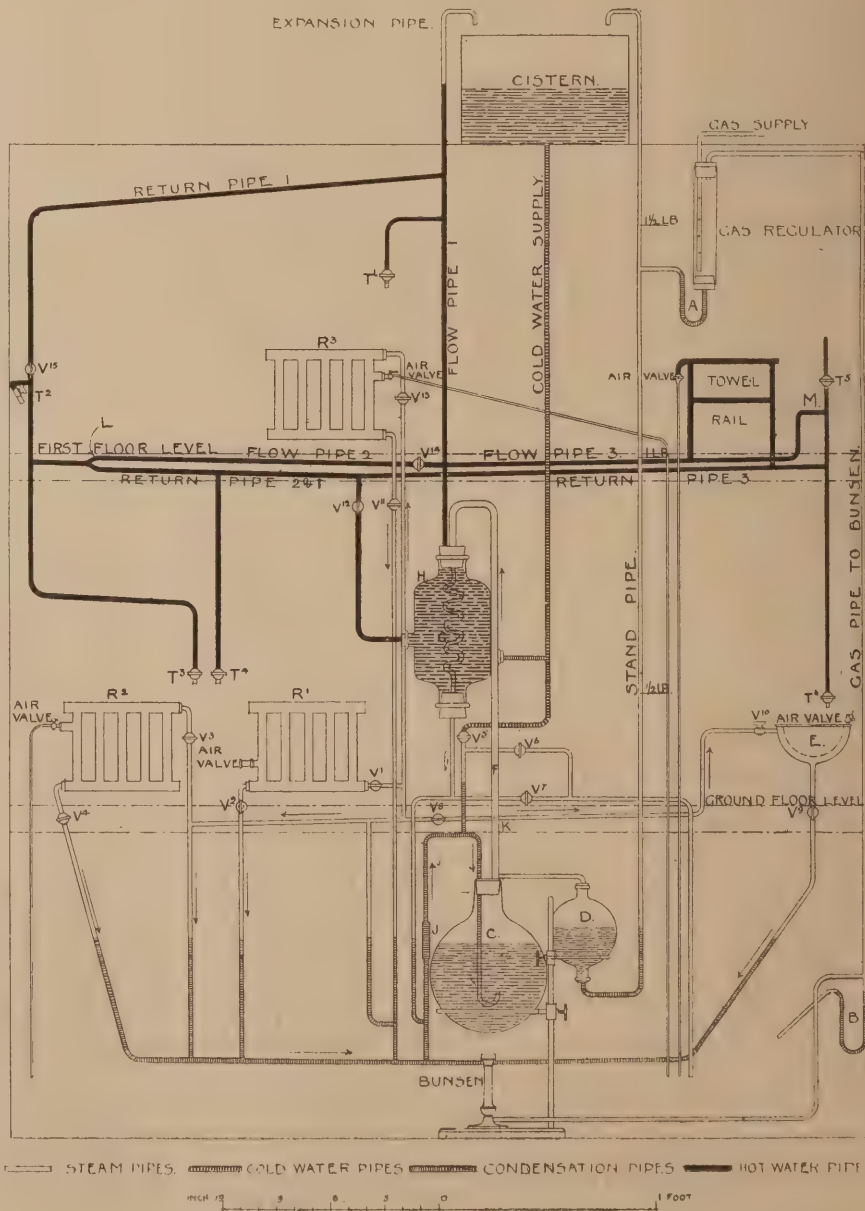

The water of condensation in all cases was returned to boiler on the two-pipe method, with a modification where it entered boiler to prevent glass breaking. The pipe to steam

jacketed boiler E (which was of copper) was taken with a rise to valve 10, and at the point where it turned to the vertical, it was seen that the condensation water formed in the pipe fell back upon the steam and caused a rattle. The steam riser F to coil in cylinder was at first about ¼ in. diameter, but a constant rattle was caused until a pipe, ½ in. was substituted, when the water fell back at the sides of the pipe, and the steam passed up the middle without obstruction.

The hot water circulation was then described, air lock being shown at L and M, and the flow of the water with three different circulations shown by coloured water and powdered amber, and their relative value tested.

A sketch was then made on the principle of flow pipe 1 showing how the most satisfactory result could be obtained.

Surveying and Sanitary Notes.

THE closing meeting in connection with the congress of the Sanitary Institute, which was held in Birmingham in September, took place a few days ago in that city, the Lord Mayor presiding. The report of the local officers stated that the congress had been successful in all respects. The number of tickets issued exceeded those of any previous year, and the attendances were in like proportion. The total number of tickets issued was 1979, as compared with 1531 at Leeds last year, 1225 at Newcastle in 1896, and 1214 in Liverpool in 1895. The number of visitors to the Health Exhibition this year was 85,212, and was 10,000 greater than had been previously attained.—Councillor Martineau submitted the financial statement, which showed that the general expenses of the congress amounted to £1463. The amount of the guarantee fund to be called up was £1469 14s. 7d., which would necessitate a call of 14s. 9d. in the pound being made upon the guarantors.—The report was adopted, and a vote of thanks was passed to the hon. treasurer (Councillor Martineau) and to the hon. secretaries (Messrs. A. Bostock Hill, W. B. Marshall, and J. E. Wilcox).—The Chairman, in replying to a vote of thanks, expressed satisfaction at the success which had attended the meetings. There was a feeling of reality about the congress which impressed him very much, and he felt that the city had benefited by their visit.

THE City Corporation having obtained an Act of Parliament authorising it to extend considerably the Foreign Cattle Market at Deptford and connect it by means of a railway with the London, Brighton, and South Coast Railway, the work, which will involve an expenditure of £100,000, will be carried out without delay. The services of Sir J. Wolfe Barry have been secured as engineer, and from report he has made it would appear that the railway and tramway outside the market will cost £32,250. For the purpose of extending the market, property in the near vicinity will be bought up at a cost of £22,000. Increased accommodation will be also provided in the shape of additional slaughter-houses, cooling rooms, increased lairage, and an extended river frontage. The estimated outlay on these works are as follows:—Slaughter-houses (a first instalment), £5000; lairage, £21,000; a junction of the three jetties (providing a continuous river frontage of 880ft.), £16,000; and property required, £22,000. The extension of the market has been rendered necessary owing to the great pressure which has been put upon the existing accommodation. The business increases every month, no fewer than 510,618 animals being slaughtered there during last year. The financial position of the market is satisfactory, as, although the loan account at one time reached a total sum of £424,000, the amount outstanding at the close of last year was only £21,000.

At a meeting of the Sanitary Inspectors' Association held on Saturday week, at Carpenters' Hall, London Wall, E.C., Mr. T. J. Moss Flower, C.E., who presided, delivered his inaugural address as chairman of the council. Having pointed out that during the fourteen years of its existence, the membership of the association had increased from 170 to 668, and the annual income from £92 to £631, he deprecated the existence of a number of sanitary inspectors' associations in the country, and urged the desirability of amalgamation. He also suggested it would be an advantage if they could organise a students' section, and also institute a fellowship. Touching on the question of superannuation, he expressed the hope that their efforts to secure this would soon be crowned with success. It was most unjust not to grant retiring allowances to sanitary inspectors. Then again, they should never give up agitating until they had been granted security of tenure, for it was a blot on our legislation that men who did such

important work should hold their offices at the caprice of a council.

THE ceremony of cutting the first sod in connection with the new waterworks for Swansea has just been performed. The cost of this scheme will be over £300,000. Messrs. Paterson, of Glasgow, have the contract for constructing the reservoir alone for about £250,000. The plans were prepared by Mr. Wyvill, the borough engineer, subject to some alterations in detail by Mr. Hill, who has now assumed responsibility for carrying out the work. They provide for a reservoir capable of holding 1,000,000,000 gallons of water, and when this is added to the over 200,000,000 gallons the present reservoirs hold it will be seen what a perfect water supply Swansea should possess on the completion of this great scheme. The dam will be at the Cray end—about 1240ft. long, and 70ft. broad at the foundation. The foundation will be laid in the solid rock, which is red sandstone, and the dam, which will be of masonry, will be 80ft. above the water level. In ordinary times the rainfall has been found to be 86.57in. near the top of the valley, and lower down 63.47in., or an average of 70in. Indeed, on one day alone the streams above the dam were so flooded that 750,000,000 gallons of water ran over the gauge at the spot where the dam is being constructed.

MR. ROBERT VIGERS, in his presidential address at the Surveyors' Institution, gave some interesting and remarkable statistics concerning the growth of London within the last half-century. Population within the administrative county had risen from 2,363,274 in 1851 to 4,232,118 in 1891, or about fifty-six persons to the acre. The number of inhabited houses was 306,064 in the former year and 548,315 in 1891, or 7.64 per house. The serious problem was how to provide a population increasing at the rate of about half a million in ten years with the proper means of internal communication. Speaking broadly, the bulk of the heavy traffic of London was between the north and south, or the termini of the great railways on each side of the river. Lighter traffic, and the ebb and flow of the pedestrian tide, was, on the other hand, mainly from east to west. What would the state of things be in twenty or thirty years' time? and yet nothing had been done to mitigate the growing inconvenience. The system of tube railways would probably absorb some of the foot traffic, but their carrying capacity would soon be reached, and wider roads and pavements, and new arteries for vehicles would become imperative. What had hitherto been done was mere tinkering, and an enormous expenditure would have to be incurred in further widening streets like Oxford Street, Holborn, Strand, Fleet Street, and Ludgate Hill, which were originally laid out for a population one-tenth the present size. The value of property had enormously risen in the City, and he had purchased for £73,000 property which the grandfather of the vendors had given £1500, or now representing a rental of nearly £3000 a year.

THROUGHOUT the past week the wealthiest quarter of the wealthiest city in the world has, says the Globe, had its principal thoroughfares in a positively disgraceful condition. Thickly covered with greasy mud, their surfaces are equally dangerous to man and horse. Only here and there is any attempt made to get rid of the filth, and even these efforts are of the feeblest. Instead of first flushing the surface, and then thoroughly cleaning it by either machine-brushing or hand-scavenging, the usual method is to employ watering-carts by themselves. The result is, of course, the creation of mud-morasses, into which whose enters leaves hope behind. When the remedy is so simple, being nothing more intricate or expensive than regular and efficient scavenging, it is simply unpardonable that public convenience and even safety should thus be deliberately set at naught.

ONE might imagine that damp, foggy weather in November is so unusual that the authorities

were caught as unprepared with remedial measures as they generally are when a sudden snowstorm impedes traffic. But in that case there is some slight excuse for delay, owing to the difficulty of obtaining sufficient carts to carry away the snow quickly. No such pretext can be assigned for the non-removal of mud. Every vestry has at its disposal all the necessary cleansing appliances; scavengers, watering carts, machine brushes, hydrants, and refuse carts are liberally paid for, to any required extent, by the ratepayers. The parish authorities cannot, therefore, plead want of means in excuse for their discreditable apathy; it is their lack of will and of energy that produces the present scandalous state of things. Even if they were caught napping at first, they have had ample time to rouse up and address themselves to the discharge of one of their most important functions, that of keeping the roads under their respective controls in clean and passable condition. It should not be left for the metropolitan public to pray for a deluge of rain as the only "deus ex machina" likely to grapple successfully with the mud fiend.

ON July 26th last, on the recommendation of the Main Drainage Committee, the London County Council accepted the tender of Messrs. John Penn and Sons, Limited, amounting to £16,900, for converting four beam-engines at the Crossness Sewage Outfall into triple expansion engines. In a letter which accompanied their tender, Messrs. Penn and Sons stated that they could not carry out the work under the conditions agreed to between the federated engineering employers and the joint committee of affiliated trade unions at the conclusion of the late engineering dispute, but that they did not anticipate there would be any great difficulty on that account. Subsequently, however, Messrs. Penn and Sons informed the Council's solicitor that they were unable to accept the conditions contained in the form of contract, and upon being asked to state in detail to what conditions they objected and what alterations they desired to have made, they replied by stating they could not then undertake the work. The Main Drainage Committee reported that in these circumstances they could see no other course open but to accept one of the other tenders received on June 28th. They passed over the next lowest tender as being one they could not ask the Council to accept, and recommended the acceptance of the next tender, that of Mr. B. Goodfellow, amounting to £20,864, as they were informed that this tenderer was capable of carrying out the work satisfactorily. The Council has now endorsed this recommendation, and the tender has been let to Mr. Goodfellow. From what has transpired it is inferred that Messrs. Penn and Sons' objection to the form of contract related entirely to the labour conditions.

THE Tottenham Urban District Council received a sharp lesson, which is of general application, on the subject of proper attention to roadmaking. They were sued in the Queen's Bench, before Mr. Justice Bruce, for damages by a furniture-van driver named Hill, who in driving down Pembury Road and under a railway arch met with a serious accident. His van was jolted and hoisted to one side by a ridge in the road, with the result that he was thrown into contact with the girders, and his collar-bone and two ribs were fractured. The District Council contended as a matter of law that they were not liable, inasmuch as they had employed an independent contractor to repair the road, and that he was responsible for any defect in it. On the other hand, it was alleged that defendants had retained such control over the contractor's work as to make them liable. Mr. Justice Bruce said there was a duty imposed upon the defendants which made them liable, they having allowed the road to be used by persons driving vehicles at the time the ridge existed. There was, therefore, neglect of duty, and he must give judgment for the plaintiff for £150. He was reluctant to stay execution, but he would do so on condition that £75 was paid over to the plaintiff within a fortnight, and notice of appeal given within that period.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—			
Dec. 2	Bradford—Engine House		S. Jackson and Sons, Tanfield-chambers, Bradford.
" 2	Halifax—Pair of Villas		
" 2	Hastings—Coastguard Station	Admiralty	Coastguard Station, Hastings.
" 2	Coverack—Hotel		S. Hill, Green-lane, Redruth.
" 2	West Hartlepool—School	School Board	School Board Offices, Park-road, West Hartlepool.
" 3	Sheffield—Urinal and Wall	Health Committee	C. F. Wike, Town Hall, Sheffield.
" 3	Blackburn—Wing to Infirmary		Simpson and Duckworth, Richmond-chambers, Blackburn.
" 3	Boat of Garten Bridge		A. Mackenzie, Kingussie
" 3	Falkirk—Manse		A. Gauld, Melville-trust, Falkirk.
" 3	Keighley—Houses		W. H. and A. Sugden, Keighley.
" 3	St. Albans—Four Shops, &c.		J. E. Austin, 23, York-place, Baker-street, W.
" 5	Halifax—Villa		G. Buckley and Son, Tower-chambers, Halifax.
" 5	Greetland—Twenty-five Houses		S. Wilkinson, Sowerby Bridge.
" 5	London, W.—Conveniences	St James' Vestry	Surveyor, Vestry Hall, Piccadilly.
" 5	Sutton—Buildings	Great Northern Railway Company	Company's Engineer-in-Chief, Amiens-street, Dublin.
" 5	West Yale—Twenty-five Houses	Sowerby Bridge Industrial Society Ltd.	S. Wilkinson, Sowerby Bridge.
" 6	Loughborough—School	School Board	Barrowcliff and Alcock, Mill-street, Loughborough.
" 6	Rugby—Fire Brigade Station	Urban District Council	D. G. Macdonald, Surveyor, Rugby.
" 7	Waddon—Hospital Additions	Croydon Town Council	Borough Engineer, Town Hall, Croydon.
" 8	Dorking—Shed	Guardians	Bagman and Benison, 76, South-street, Dorking.
" 8	Winchester—Workhouse Additions, &c.		Cancellor and Hill, 12, Jewry-street, Winchester.
" 9	Ovenden—Two Villas		M. Hall, 29, Northgate, Halifax.
" 10	Troon—Schools		H. W. Collins, Penryn-street, Redruth.
" 12	Barnsley—Electricity Buildings	Corporation	G. H. Taylor, St. Mary-place, Barnsley.
" 12	Eccles—Bowl House and Pavilion	Parks Committee	Borough Surveyor, Eccles.
" 13	Coventry—Sub-Stations	Electric Light Committee	J. E. Swindlehurst, St. Mary's Hall, Coventry.
" 13	Easington—Houses	Admiralty	Director of Works Dept., Northumberland-avenue, W.C.
" 13	West Ham—Sessions Court, &c.	Corporation	L. Angel, Town Hall, Stratford, E.
Jan. 24	London—Tunneling Works	London County Council	Engineer's Department, County Hall, Spring-gardens, S.W.
No date.	Barrowby—Room		Canon Welby, Barrowby Rectory, Grantham.

Property and Land Sales.

To Contractors, Builders, Engineers, and Others.

MESSESS. FULLER, HORSEY, SONS, and CASSELL are instructed to **SELL** by **AUCTION**, in Lots, at Bell-yard, Bell-road, Bromley, E., on **THURSDAY, DECEMBER 1st, 1898**, at Twelve precisely, **CONTRACTOR'S SURPLUS PLANT and MACHINERY**, including 18 h.p. portable engine, 7ft. mortar mill, with vertical engine and boiler; mortar mill, with 7ft. pan; 2 Chaplin's portable steam cranes, hand-power derrick crane, 10 crabs and winches, 15 iron ships, Sissons and White steam pile driver, 7 pile and wringing engines, 12 pile monkeys, double cylinder steam winch and vertical boiler, portable steam hoist, 3 Gwynne's centrifugal pumps, 2 chain pumps, 3 pairs contractor's pumps, Blake's steam pump, Blake's stone crusher, Adie's cement tester, 12 one-yard end-tipped wagons, 10 trolleys and frames, 5 tons contractor's rails, 10 iron tanks, 6 portable offices, 6 large anchors, shear and pipe legs, iron blocks, 2 sand-washing machines, 25 tons wheels, girders, and ironwork, 150 loads useful timber, 5 loads greenheart ends, 200 struts, 10,000 assorted bricks, large quantity stone, slates, tiles, &c., iron and wood sashes and doors, stone truck, spring cart, and other effects.

May be viewed the day preceding, and catalogues had on the Premises; and of the **AUCTIONEERS**, 11, Billiter-square, E.C.

FAIRMILE PARK, near Cobham, Surrey.—A **FREEHOLD BUILDING ESTATE** of about 40 acres, with possession.

MESSESS. DRIVER and CO. have received instructions to offer to **AUCTION** at the **MART**, Tokenhouse-yard, Lothbury, **NEXT SPRING** (unless previously sold by private contract), the above property, situate in a favourite residential district, about a quarter of an hour's walk from the Oxshott and Fairmile Station, and about a mile and a half from Cobham Station. The estate comprises Building Land, ripe for development, the higher portion (sloping to the south) possessing charming views over the intervening country to Epsom Downs; and a Residence known as "South Lodge," with stabling and garden; Eight small Villas, some Cottages, and the "Griffin" Beerhouse. On a portion of the estate brickearth is being worked, and will be included in the sale as a "going concern."

Particulars and plans, when ready, can be obtained of **CHARLES JUFF, Esq., Solicitor**, 48, Lime-street, E.C.; and of **Messrs. DRIVER and Co.**, 23, Pall Mall, S.W.

SURREY.—Choice BUILDING ESTATE.

—In a charming district, two miles from Horley station (L.B. and S.C. Ry.) under one hour from London and adjoining a village where are church, shops, and post-office; two miles from Roman Catholic Church.

FOR SALE, a compact and valuable **FREEHOLD PROPERTY** of 53 acres, with a frontage to the main Brighton road of 2000ft., and perfectly ripe for development, with residences of a good class. Prettily timbered. Gas and water mains along the frontage. Would be divided.

Plans and full particulars of the owner's agents, **Messrs. GREEN and SIMES**, Auctioneers and Estate Agents, Blenheim Mansions, Queen Anne's-gate, London, S.W.; or **Mr. W. M. LEACH**, Auctioneer and Estate Agent, Crawley, Sussex.

By order of the Trustees of Morden College.

GREENWICH.

To Brewers, Licensed Victuallers, and other Investors.

MR. MATTHEW MILES (late Warlters, Lovejoy, and Miles) is instructed to **SELL** by **PUBLIC AUCTION**, at the **Masons' Hall Sale Rooms**, E.C., on **TUESDAY, DECEMBER 13th, 1898**, at **ONE O'CLOCK** precisely, the undermentioned very valuable **PROPERTY**, in Two Lots.

A **REBUILDING LEASE** for **EIGHTY YEARS**, at a

Ground-rent of £125 per annum, with possession at Midsummer next, of

The **GLOUCESTER TAVERN**, Fully-licensed Publichouse, with a frontage to King William-street of 169ft. and to Nevada-street of about 83ft., thus offering exceptional facilities for early development. This property is most prominently placed, immediately facing one of the principal entrances to Greenwich Park, and covers an area of about

8460 Square Feet.

A **REBUILDING LEASE** for **EIGHTY YEARS**, at a

Ground-rent of £80 per annum, with possession at Christmas, 1899, of

The **DUKE of WELLINGTON** Fully-Licensed Publichouse, No. 128, Old Woolwich-road, East Greenwich.

having a superficial area of about 4510 square feet.

This house is well situated for business, and when rebuilt should command an extensive trade, to which the improvements now taking place in the immediate neighbourhood must necessarily contribute.

May be viewed by leave of the respective tenants. Printed particulars and conditions of sale, with plan, may be had of **Messrs. GOLDING and HARGROVE**, Solicitors, 99, Cannon-street, E.C.; of **T. BARNES-WILLIAMS, Esq.**, Surveyor to the Trustees, 24, Railway-approach, London Bridge, S.E.; and of the **AUCTIONEERS**, 55, Chaucery-lane, W.C.

To Builders, Contractors, Laundermen, &c.

WANDSWORTH.—Freehold, close to the old town.—**Builder's Premises**, about one-third acre in extent, suitable for erection of workshops, laundry, &c., together with large residence and stabling, which **Messrs.**

BOREHAM and COMPANY (of Mowbray House, Norfolk-street, Strand, W.C.) will **SELL** by **AUCTION**, at the **Mart**, E.C., on **WEDNESDAY, DECEMBER 14th**.

Particulars of the **AUCTIONEERS**.

ASSOCIATION OF DESIGNERS.

DESIGNS, WORKING DRAWINGS, PERSPECTIVES, ARCHITECTS, DECORATORS, & BUILDERS ASSISTED. INTERNAL DECORATIONS EXECUTED IN ALL STYLES.

ITALIAN. FLEMISH. GEORGIAN. FRENCH. ENGLISH. ADAMS.

Offices: 20, JOHN STREET, ADELPHI, W.C.

R. I. B. A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to **Mr. W. CHURCH HOWGATE, A.R.I.B.A.**, Perchard House, 70, Gower-street, W.C. (close to the British Museum).

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

R. I. B. A. SOCIETY OF ARCHITECTS, and CIVIL SERVICE TECHNICAL EXAMINATIONS. Preparation by correspondence, in residence, or personally.—MIDDLETON and GARDEN, 19, Craven-street, Strand, W.C.

PLANS, SPECIFICATIONS, QUANTITIES, &c., carefully prepared by young Architect. Moderate terms to those about to build.—ARTISTIC, 1, West-terrace, Whithy.

TO SHOP-FITTERS and BUILDERS.—Sketches of shop fronts, fittings, &c., artistically prepared by advertiser, who has had considerable experience with the leading shop-fitters in London. Terms extremely moderate.—PEDIMENT, Office of the BUILDERS' JOURNAL.

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

TRACING and TYPE-WRITING.—VACANCIES for pupils in well-established Office, Gentlewomen only.—Box 883, BUILDERS' JOURNAL Office.

WANTED, a thoroughly qualified **ARCHITECT'S ASSISTANT**. Must be able to help with quantities. Salary not exceeding £3 3s.—Reply, stating experience, forwarding specimens of work, to **ARCHITECT**, 102, Westborough, Scarborough.

ARCHITECT and SURVEYOR'S ASSISTANT.—WANTED at once, good draughtsman, able to level and make small surveys. Knowledge of specifications required.—Apply, in first instance, by letter only, enclosing references and stating salary required, to **Messrs. POWELL and Co.**, St. Swithun's Estate Offices, Lewes.

WANTED. —COMPETENT MAN as **CLERK of WORKS** to superintend Contract for laying out new roads and sewers in the neighbourhood of Bristol.—Apply, stating age, experience, and salary required, with copies of testimonials and names of references, to **Messrs. CYRIL and C. THOMPSON**, Architects, Land Agents, and Surveyors, Bristol.

APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

YOUNG ARCHITECT, A.R.I.B.A., DESIRES to ASSIST others in the PREPARATION of DRAWINGS at his own office.

G. SCORER, 28, Newman-street, W.

ANSSELL and MALLOWS, Architectural Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C.

AGENCIES WANTED by an old-established Firm of Iron and Builders' Merchants in a large district.—Apply Box 900, Office of the BUILDERS' JOURNAL.

YOUTH (17) seeks **SITUATION** in Surveyor's or Architect's Office. Knowledge of tracings and land quantities. Two years' experience.—**L. LAWRENCE**, 6, Broadway, Woking.

ADVERTISER desires an **ENGAGEMENT** in Architect's office. Junior position. Country preferred.—Address, **C. H. LENTON**, Clifton, Biggleswade, Beds.

WORKING FOREMAN of **PAINTERS** seeks **RE-ENGAGEMENT**; large London experience; good colourist and manager of men; town or country; good personal references; wages moderate.—"W. P.," 14, Ravensdon-street, Kennington Park.

ARCHITECT and SURVEYOR'S JUNIOR ASSISTANT **DISENGAGED**. Levelling, surveying, good draughtsman, inking-in, colouring and tracing plans, &c. Usual office work. Good testimonials. Moderate salary.—**J. S. RAMSHAY**, Oundle, Northants.

ARCHITECT'S JUNIOR ASSISTANT (20) seeks **RE-ENGAGEMENT**. Neat and quick tracer. Shorthand (60). General office routine. Six years' experience.—**H. WITT**, care of Messrs. Gibson and Russell, 11, Gray's-inn-square, W.C.

ASSISTANT (Architect's) **Disengaged**. Used to infirmaries, hospitals, hotels, and domestic work. Practical and artistic draughtsman.—"Art," 4, Butler-street, Preston, Lancs.

HIGHEST AWARDS.

ALBION CLAY COMPANY LIMITED.

SOLE MANUFACTURERS of the

"GRANITIC STONEWARE" Pipes.

TRADE MARK.

All the "**Granitic Stoneware**" Pipes are made from "**Stoneware**" Clays, of which we are the Sole Proprietors. The Clays are carefully selected and blended to insure a hard, dense, **impervious and imperishable** body, specially adapted for **Sanitary** purposes. The Pipes have a "**toughness**" as opposed to "**brittleness**," which is not possessed by any other Stoneware Pipes. They have been proved to withstand the highest crushing and bursting pressures under tests by Kirkaldy and other authorities at home and abroad. They are made by the most improved Patent Machinery and are highly approved for their uniform superior quality. All the Pipes are stamped with the Trade Mark, "**Granitic Stoneware**," as above.

TESTED PIPES.—Selected and Tested under Hydraulic Pressure and Marked

All sizes to 24in. diameter of full Standard thickness, and of any length up to 3ft. for 6in. and upwards.

PATENT PARAGON PIPES.

PATENT PARAGON PIPE. C FORM.

PERSPECTIVE VIEW

LONGITUDINAL SECTION THROUGH C

SECTION THROUGH

Sound Portland Cement Joints to stand any test. True alignment of the Invert and Firm Rest. No obstructive ledges at Invert as with ordinary Socket Pipes. Free Flow. No Stoppage. Full Capacity of Sewers and Drains maintained.

CHEAPEST IN FIRST COST AND MAINTENANCE.

The **Patent Paragon Pipes** are superseding the **Ordinary Socket Pipes**. They are being specified for important Sewerage and Drainage Work in all parts for Government, Corporations and Sanitary Authorities. They have been used for the new Drainage of Smedley's Hydropathic Establishment, Matlock, Derbyshire, and the Royal Opera House, Covent Garden, London, &c.

To meet the requirements of **Sewerage and Drainage** according to circumstances, the **Patent Paragon Pipes** are made in **three** forms:—(A) With ordinary depth of Socket for Surface Water Drains, &c.; (B) With **deep** Sockets for **Sewers and House Drainage** and (C) With **extra deep** Sockets for the Best Class of Work.

When **specifying**, the Name should always be given in full, as **Patent Paragon Pipes A, B, C**, according to the kind required.

SYKES' PATENT JOINT PIPES.

THE MOST RELIABLE
PIPES FOR MAIN SEWERS
IN WATER-LOGGED
GROUND.

WATERTIGHT JOINTS
MADE WITH THESE
PIPES WHEN ENTIRELY
SUBMERGED.

The Screw Joint ensures true alignment of the Pipes. The **Patent Jointing Material** is **impervious and imperishable**. It sets slowly and yields for a time to any settlement of the Pipes in bad ground. It cannot enter the pipes and cause obstruction therein, as in grouting. Sykes' Patent Joint Pipes have made Watertight Joints in water-logged ground where other Patent Joints have failed. Easily laid by ordinary Pipe-layers. Bends and Junctions easily inserted.

Moderate in Cost, Easy to Lay, and the most Reliable of any for Bad Water-logged Ground.

SYKES' PATENT SEWER GAS INTERCEPTOR. The most **EFFECTIVE** for the **PRESERVATION** of **HEALTH**.

JONES & SYKES' PATENT CHANNEL BENDS FOR MANHOLES AND INSPECTION CHAMBERS.

SANKEY'S PATENT DEEP INTERCEPTING GULLY, with Galvanised Bucket to hold Detritus. Cannot untrap.

KEITH'S PATENT DRAIN TESTING AND FLUSHING TRAP. Simple in Construction, efficient and reliable.

SYPHONS, GULLIES, INTERCEPTORS, &c., with **PATENT PARAGON SOCKETS**, to avoid check to flush in forcing Solids through the Trap and fitted with **SYKES' Patent Screw Stoppers**.

INVERT, JUNCTION, and GULLY BLOCKS, STREET GULLIES to any size. **LATRINES, CLOSETS, SINKS, &c.**

An Architectural Causerie.

Church Restoration in Norfolk.

OUR recent article embodying the fact that Worstead must be restored suggests some remarks which will be found to relate not so much to this one church as to parish churches in general; those of Norfolk particularly. A church which would accommodate per-

haps two or three thousand people is only resorted to now by as many as can be spared from amongst the inhabitants of a village (no longer a town of importance), the actual population of which is set down in the Cyclists' Companion as only 800. One enters the church to see the interior rearranged to meet the case of a congregation reduced to something exceedingly small; the whole of the nave deserted, and a pulpit set up against the north wall in the east, so that the pastor confronts a very compact little audience, and the present extent of his church is only the width of the chancel. This having been duly noted, our attention was drawn to the usual appeal for money to be devoted to restoring the building. The architect's report on its state is appended to the appeal, and as it is carefully drawn it should be attentively studied. It is thought that £2000 more or less will suffice for the present. If only to ensure its stability, a good deal must be spent at once, and this to a generation that looketh so greedily for outward and visible

signs may seem to be wilfully wasteful, whereas it *must* be done first, and is of the utmost importance, for what is there but absolute folly in lavishing ornament on anything less than perdurable? The architect puts this consideration before any other, and proceedeth to say 'twill be better to do the thing gradually, the ultimate object being to restore to the church as a whole the semblance at least of its splendour. The laudator of the remote may have noticed, stuck up in the belfry, an announcement strangely anachronous of a cyclist's gymkana to be organised there very shortly, and may have sighed as he buttoned his pockets. The above, we believe, is a fairly correct statement of how matters stand at the moment. The county of Norfolk, once the richest in England, has perhaps more churches requiring attention than any, and those of the largest size. Its flint-built perpendicular churches, with their great commanding towers, are its most familiar features. They may be said, speaking roughly, to be much of one date; and, excepting the few that are sheltered, about equally miserable in outward appearance.

AN OLD INN AT NORTON ST. PHILLIP, SOMERSET. SKETCHED BY MISS MILDRED R. BENNETT.

The exterior may be redeemed as at Worstead, by the handsomest courses of ornament wrought in shaped stone; the façade by its beautiful panelling, but their awaits us within a visitation of sadness which, as long as one stays in Norfolk, will be repeated only too often. There is not even gloom to exalt us, for there are windows of vast extent, admitting nothing but colourless light, and flooding some acres of what may have been whitewash once on a time. The comparative poverty of mouldings, which "incline to the chamfer plane," and provide no lurking places for shadows, has probably something to do with it, but, whatever the reason, the impression remains. As Worstead is one of the finest churches, and its congregation, having regard to its size, is certainly one of the smallest—it may be regarded as typical, and the question which vexes one is, what are we to do with them all? The most obvious need is of a missionary, possessed of the zeal of a Wesley or, if it liketh you better, a Savonarola—a Loyala—whose object shall be to restore, not the church, but the congregation. Supposing this could be done, there remains little doubt in our mind that the money required would come, but for a change so complete we must wait, and meanwhile the clergy are begging. There is a growing disposition to think that the interest of churches as objects of beauty, apart from their purpose or use, is sufficiently great to allow of the charge for their maintenance being borne by the people at large, and there was presented to us only lately the report of a meeting held in the House—the Duke of Westminster presiding—which had as its object the union into one body of several societies, which endeavour, each in its way, to preserve what is worth preserving, and to obtain for this body when formed the recognition of Parliament; but the members of all these together represent not a tithe of the voters, and it remains to be seen how long it will be before the hyperæsthetic idea of maintaining our churches merely because they are beautiful will be favourably entertained by Mr. John Bull. We have already in England the spectacle of a nation consisting largely of abstainers from Sabbath observances, and nonconformers for different reasons, whose components contribute perforce to the maintenance of the Establishment, and now the suggestion is that the whole cost of maintaining the buildings themselves shall be drawn from the rates. There is comfort perhaps in the thought that funds so obtained would be administered by our own officers; but there are still two sides to the question, and it is thought that consideration of the greatest happiness of the greatest number should enter largely into the question. A great deal of what could be said of these churches, their empty windows especially, must be withheld for the present. It may be thought that an Anglo-American completion fund is just as much needed as the one we propose to devote to the maintenance of the same buildings, for how many square miles of mere window space have yet to be filled with stained glass. The Perpendicular style was evolved, it would seem, to make work for the Christopher Whall of the day. As examples of what was actually done we may point to the windows of Fairford, St. Margaret's, Westminster, the chapel of King's College, Cambridge, and perhaps a few others; but these are the exceptions, and there is nothing more hopelessly incomplete, to our mind, than the buildings above described; but to do or attempt to do what we suggest would, of course, be worse than absurd until we have recovered the worshippers. One feels in these gaunt parish churches as many have felt in Rome, where you may prowl throughout the long day within the circumference of the original city, and recall what you can of her past.

E. R.

ON REFLECTION.

Vandalism in Florence.

A writer in *The Academy* calls attention to the policy of modernity which, under the discretion of the municipal council of the city, has, during the last few years led to the destruction of many ancient Florentine buildings. "A few years ago," says the writer, "the beautiful Mercato Vecchio was turned into a bran-new Piazza Vittorio Emanuele," but this is not all, for it is rumoured that there is an intention to dismantle the Ponte Vecchio and the Palazzo Guicciardini in favour of a tram line along the Via Guicciardini to the Pitti. The Academy writer points out that if a tramway to the Pitti were needed, which it is not, it might run over the Ponte S. Trinità and along the Via Maggio, without doing any positive harm. It seems incredible, however, that it can really be proposed to modernise the old Ponte Vecchio, which, with its goldsmith stalls, is one of the most characteristic and individual features of mediæval Florence. The reason which is said to prompt the authorities to favour this scheme is a strange satire on the tastes and appreciative faculties of the foreign visitor; for the tram line, and the dismantled bridge and Piazza have been conceived as a concession to their wishes. It is considered that facilities of cheap locomotion and gayer streets would further attract the tourist and enrich the citizens; and as the Ponte Vecchio is not one of those historical monuments to which the guide-books grant many paragraphs, it may well be spared. However, a Society for the Preservation of Ancient Florence has already been formed in Florence itself, and it is hoped that with the co-operation of an expression of English and American opinion the municipal authorities may be persuaded that it was to their interest to preserve these ancient buildings. A memorial is already in circulation, and a copy of it will lie at the offices of the BUILDERS' JOURNAL for signature until the 10th inst. It may be pointed out that this is no instance of unwarranted interference, as the memorial in question is of Italian origin.

Statues for London.

WE have noticed with gratification that under its new General Powers' Bill the London County Council is about to consider a proposal that statues of Chaucer and Milton should be placed upon the site which will become available under the Strand Improvement Scheme by the removal of the Holywell Street block of houses. We think this idea, which we believe is to be attributed to Mr. Palmer, a most admirable one, and it has recommendations that should appeal to everyone. Neither Chaucer nor Milton have been made subjects for public statues in London, although Milton is one of the three figures which grace the disconsolate-looking fountain in Hamilton Place, and he is prominent in the bass-reliefs about the Albert Memorial; yet both he and Chaucer, and Spenser also for that matter, were Londoners. By a graceful coincident also, the year 1900 sees the fifth centenary of Chaucer's death. The site, too, apart from the æsthetic possibilities it suggests, has a further fitness and significance, for the spot will be within the circle which has been the chief scene of the literary history of England. The proposal for a statue of Milton in Cripplegate churchyard, which was mooted a short time ago, is, we think, a futility. The sentiment is false; it is the memory of Milton we would celebrate, not his hidden tomb. Wherever the suggested statues are placed, however, we hope and trust that they will be adequate, and that they will be 'distinguished above other modern

London statues by an appreciation of the grand possibilities such works afford, to beautify the city. To this end the statue must not be placed where casual expediency may indicate, but must be central and symmetrical with its surroundings. It should be the focus to which the eye is instinctively led. In consummation of this idea the statue must not merely show the poet frozen to white stone, standing solitary in the rain; but should be a composition which is a panegyric on the personality and nationality of the poet, and a trophy to his achievements; somewhat let us say, in the spirit, though not in the letter, of modern French memorial sculptures. The actuality of General Gordon in the public mind might perhaps palliate, though it could never excuse, the crude, bald realism of the otherwise true and pathetic statue in Trafalgar Square, which is year by year losing all meaning; but any such qualities would be wholly intolerable in a monument to Milton raised now.

Our Cathedrals.

WE probably never fully realise what vast sums are subscribed by the public towards the restoration and maintenance of our cathedrals. In the ten years following 1883, £32,000 was collected to cover the expenses of the restorations at Peterborough, and since 1894 nearly £10,000 more has been given, while yet another £10,000 is asked for the completion of the western towers and minor repairs, of which sum £500 was promised at a meeting lately convened on behalf of the fund. At Canterbury, Dean Farrar is raising a fund of £20,000 for purposes of replacing the decaying portions of the cathedral fabric, and, as lately described in this column, £27,000 has been subscribed to meet the expense of building the nave of Truro Cathedral, the work being arranged to commence next year. In Dublin also, the expediency of speedy restoration of the eastern chapels of St. Patrick's Cathedral is being urged, and in Belfast, the munificence of the late Countess of Shaftesbury, who bequeathed £7000 to the project, has enabled a sum of nearly £15,000 to be raised for the building of the proposed Belfast Cathedral, which, according to the plan and estimate of the architect, Mr. Drew, is to cost nearly £50,000. We have no doubt that there are other works of the same kind in progress elsewhere to which our attention has not been called. The restoration of these old buildings, if carried out in a properly reverential spirit, is a costly matter, but the money is well spent that preserves to us some of the noblest Art relics of antiquity, and may be considered to be invested at a sort of compound interest for the benefit of posterity, for every year that passes lends its aid to the enrichment and preciousness of these inimitable links with the past.

INN AT NORTON ST. PHILLIP.

THE old coaching inn at Norton St. Phillip, Somerset, a drawing of which we illustrate on our front page, is situate about six miles from Frome, on the Old Bath Road. It was built early in the fifteenth century, and is said to be the oldest licensed house in England. Some authorities say it was formerly the Grange of the Prior of the Carthusian Abbey at Hinton. In old days, Norton St. Phillip was noted for its large cloth and wool fair, which was held in the large upper room of the "George." The Duke of Monmouth slept there on the night of June 26th, 1685. The following day the rebels won a skirmish against the king's troops under Feversham, and were able to make their entrance into Frome. While at the inn, a man fired at the duke while he stood in the window, hoping to get the reward offered for his life.

ARCHITECTURAL IMPRESSIONS IN FRANCE.*

NOTES ON A HOLIDAY TOUR.

BY J. EDWIN FORBES.

II.

WE left Caen for the seat of French Renaissance—the Loire district. In passing Paris—the fairest of all cities—I can only advise those who have not yet been there to go and study it—its Street Architecture, its churches, its museums, its theatres. I am not going to attempt to describe Paris, not even to touch on, but only to draw your attention to what Gwilt has to say about its Street Architecture. The most beautiful Street Architecture in Europe is to be found in Paris; and so great in that respect do we consider that city that we are certain the education of an architect is far from complete if he be not intimately acquainted with the examples it affords.

We caught the Spanish mail train from Paris to Blois. The first building that really attracted our attention was the Château. I never saw it look so grand as it did that moonlight night of our arrival, towering high above us, looking the emblem of strength and beauty.

The town is fairly interesting and very well situated, the main street being in a valley, and running at right angles to the river, while on either side the ground rises, crowned on the one by the Château de Blois, while on the other is the Cathedral with its classic tower.

Let us begin with the Château. It is well worthy of a brief description. The plan is, roughly speaking, an irregular four-sided figure, with a break in the south-east side. It has been built, added to, and reconstructed at various times. It divides itself into three wings. The François I. wing, the Gaston wing, the remainder Louis XII. wing. The most interesting by far is the François I. wing, in the centre of which is a magnificent open staircase. The rooms inside are all very spacious, each with its stone chimney-piece, all rather heavy in design. The ceilings have wooden rafters, the underside of same is generally decorated in colour. The walls are all painted in some large design, a warm red with blue being the favourite, but most of the colour decoration has been restored. The floors are oak parquetry, and beautifully polished. There are no lobbies—the one room leading out of the other, and so on. There are only two rooms in the whole Château which are panelled—the one is the Queen's study, which has 250 carved oak panels, all different, and very elegant in design, picked out with gold leaf; the room next it, and of the same size, having only the designs stencilled on the panelling—not carved. The effect is brilliant. The Gaston Wing dates from the time of Gaston d'Orleans, and is the most unattractive piece of work imaginable. The creature took into his head to reconstruct the Château, but either haply died or was persuaded to stop after completing a side and a quarter.

The remainder belonging to Louis XII. time is a side and a half, and is very harmless to the outside, and rather picturesque to the courtyard. It is executed in red brick, with yellow stone dressings, giving a nice piece of colour, and is in a similar style to François I. Wing.

A three days' trip we took to Château Chambord was the most interesting part in the whole of our holiday.

It is a pleasant run of fifteen miles on the steam tramway to Bracieux, from whence it is a four-and-half miles walk through the forest to the Château.

The Château Chambord is uniquely situated in the centre of a deer forest twenty miles square. As all the roads radiate in a straight line to the Château one can see its towers and pinnacles, its great circular roofs glistening in the sunshine for miles. Here it stands alone in its majesty, away from everything, the

only thing to take up one's attention. It grows on one and seems part of one's being. The grouping above the main cornice of its dormers, turrets and huge chimney stalks, is beautiful. It has 440 apartments and the stalls accommodate 1100 horses. Let me give you Fergusson's short description; he says: "This Château was commenced by François I. in 1526, immediately on his return from his Spanish captivity. The design is so essentially French that although its details are generally classical, they are kept so subdued and subordinate

HOUSE IN RUE DU TABOUR, ORLEANS.
SKETCHED BY J. EDWIN FORBES.

to the whole that they scarcely interfere with the effect.

The Château itself consists of a cubical mass measuring 220ft. each way, from outside to outside of the four great towers that adorn its angles. These are situated on one side of a court surrounded by buildings. These are the same height as the central mass on that side which

it occupies; on the greater part of the other three sides, only one story in height; and at each angle there is, or rather was, intended to be a great circular tower similar to those attached to the main building. Measuring over these, the dimensions of the building were 520ft. by 390ft. The whole was surrounded by a terrace overhanging a broad and deep moat.

The central building was divided into three equal stories in height, but by cornices so subdued as to be little more than string courses, and the upper one projected so as to carry a balcony all round the main building. It is divided vertically into an infinite number of equal panels by pilasters of the Corinthian order, an arrangement which would have been singularly monotonous in most cases, but which in this instance is entirely relieved by the very varied outline of the building, and, more than that, by the different way in which they were treated, many being left blank, some filled in with arcades, and many with square-headed windows, so that few buildings possess more of that unity with variety which is so charming when properly employed in architectural composition.

The most singular and most characteristic part of the whole design is the roof, which rises in a cone surmounted by a cupola, over each of the towers and in square masses over the rest. The whole is relieved by dormer windows in very elegant design and chimneys which are more ornamented than is almost any building erected either before or since. The whole is crowned by a central tower of domical form but wholly of open work containing a richly ornamental spiral staircase.

If we attempt to judge this building by the loftiest canons of architectural criticism, it would be easy to find many faults in it; but taking it for what it is—a Château in a flat country meant to be seen over and group with a park of ancient trees.

As a hunting seat of a gay court unconscious of any very lofty aims it conveys an impression of truthfulness, combined with elegance, which we look for in vain in many works of more pretension of later times.

Here we had to content ourselves with sketching, as one needs a pass from the Board of Works at Paris to measure. This was the first and last place we found any difficulty in being allowed to measure.

Orleans, which was our last resting-place, is an hour and half by train from Blois. The old work, when one does find it, is very Italian. It shows "the French phase of Italian Renaissance" to perfection. It is a jolly town to wander through, one always coming upon some refined old building, generally in rather a dilapidated condition, with the shutters up. It is a very nice custom the French have in a town of about this size of turning their old buildings into museums, the result being that they are pretty much scattered over the town.

The building which took up most of our time measuring was Agnes Sorel's house in the Rue de Taffur, now made into a musée. The plan is three sides of an oblong, and the elevation to the courtyard is most interesting. The elevation is simply for ornamentation, and might have been added at a later period. All the windows in it on each floor light a long passage, which runs from end to end, the other side of which is really the working wall.

The Hotel de Ville is more picturesque than beautiful. All the details are elegant, and combine many of the beauties of both Classic and Gothic, but, neither being used appropriately, the result is rather confusing.

The huge Church Ste. Croix looks well at a distance, but on close inspection is very disappointing in detail, although magnificent in conception. It dates from the seventeenth century to this century, and has a very nice central modern spire.

I may mention that every facility is given to architectural students all over France to sketch and measure, and, if the slightest difficulty, a pass from the Mayor of the town one happens to be in puts things all right.

We found the card which the A.R.I.B.A. issues very useful, it being printed in five different languages, and is given on application to probati ners.

*A paper read before the Edinburgh Architectural Society.

BLOIS CATHEDRAL. SKETCHED BY J. EDWIN FORBES.

BUILDING REGULATIONS.

MR. EUSTACE BALFOUR, M.A., F.R.I.B.A., is the newest controversialist in the Building Regulations discussion in *The Times*. Mr. Balfour says:—Dr. Longstaff's letter on this subject is very interesting, especially considering the fact that the hand of the London County Council was to some extent forced during the Committee stage of the Building Act of 1894, when I was representing the Associated Landowners of the Metropolis. The Act, as originally introduced, was almost hopelessly unworkable from a practical point of view, and is now far from perfect. It is to the architects that the modifications which make it partially workable are chiefly due. We insisted on the regulations being capable of modification to meet local circumstances. Had that not been authorised, and had not the County Council (as far as my experience goes) met this condition in a fair spirit, the Act would have had to have been repealed almost as soon as passed. It should be realised that there are

TWO DISTINCT CLASSES OF CASES

were to be dealt with in the erection of groups of buildings within the jurisdiction of the London County Council. The first class consists of those which are to be built over areas previously covered by existing habita-

tions. It is evidently to the interest of the community that in such cases every facility for reconstruction should be given. Of course, hopeless insanitary groups of buildings can be condemned, and rightly condemned. But it is also in areas of groups in a "half-and-half" condition that the administration should aim at replacing existing buildings by a sanitary scheme of tenements. Now here the owner clearly has an option. He may say to the County Council, "Give me some relaxation in your rules to fit the special circumstances of the case, and I will rebuild with all the appliances for health, and with a general conformation to sanitary requirements." Or he might say, "I will not rebuild because you will not relax your rules to fit my special circumstances." The latter course would be often to the pecuniary advantage of the owner. No possible Act of Parliament can anticipate every possible case.

RELAXATION OF RULES

must itself be the rule. Wide powers of relaxation are essential to sanitation in the highest sense of the word. The second class of cases is that in which new buildings are to be erected over areas previously uncovered. Here I at once admit that the rules to be enforced should be more strict than in the case of sites on which houses already exist. It is most undesirable that old evils should be perpetuated on new ground. There are, however, some clauses in the existing Act, notably those preventing streets being formed, which do not have through communication with existing streets, which, unless relaxed, will result adversely to health. No clauses which the wit of man can invent can be so drafted as to prevent a speculative builder (I do not use the term in any offensive sense) from evading them. But such evasion will be invariably in the direction of putting more bricks and mortar on to the ground than would have been put under permission for a reasonable relaxation of those clauses.

A BRASS eagle Lectern is to be added to the parish church of Haverthwaite in memory of the late Canon Kirby.

A NEW Wesleyan chapel has been erected at Elmswell. Messrs. Eade and Johns, of Ipswich, were the architects, and Messrs. R. Hogg and Son, of Coney Weston, were the builders.

It is intended to apply for parliamentary powers for the demolition of the parish church of All Saints, Cardiff, on the ground of its remoteness from the population and its inaccessibility. With the proceeds of the sale of the site it is proposed to erect a new church in a more convenient part of the parish.

PLANS have been prepared for a new Baptist chapel in Carlisle Road, Bradford. The site has cost £2000, and about £12,000 is to be expended on the buildings, which will comprise chapel, schools, and caretaker's house. Accommodation will be provided for 800 in the chapel, and for 530 in the school.

THE plans for the rebuilding of the new Sessions House are to be submitted to outside competition. The members of the City Lands Committee, at a recent meeting at the Guildhall, gave instructions for the appointment of an assessor. The competition will, of course, be limited.

STRANGE buildings are row and then converted into mission premises. A curious example is reported from Middlesbrough. A building, formerly known as the Prince of Wales' Theatre, was purchased during 1897, for the purposes of church work, for £3000. The building has been reconstructed in two stories, forming a church above and a club and parish room below.

HUMOURS OF BUILDING.

I.—A LITTLE BREEZE.

BY BULKELEY CRESWELL.

Characters: "Uncle" Walker: a country builder; Bill Todd: his foreman; Bolter: a clerk of works; Mr. Bates: an architect. Bricklayers, plasterers, &c., &c.

Scene: A building in course of construction. BOLTER and "UNCLE" WALKER, both portly men, discovered together and meeting them BILL TODD, a small bandy-legged man loaded with dust and with blobs of plaster sitting round the rim of his hat.

TODD (to BOLTER): Is that there a cement wall back o' the gable?

WALKER (sharply): Where's your specification? I sent you down another copy yesterday.

TODD: I can't find it. It's blowed away agin or summat.

BOLTER: What again?

WALKER: Blown away again has it? What's that you've got in your hand?

TODD (holding out a few torn and crumpled sheets): This 'ere's some of it, but that there new plasterer found it and 'ad 'is dinner off of it.

BOLTER (grinning): Well, Uncle, you'll have to send down another copy.

HOUSE IN RUE BOURGOGNE, ORLEANS. SKETCHED BY J. EDWIN FORBES.

CHATEAU CHAMBORD: DORMER WINDOWS. SKETCHED BY J. EDWIN FORBES.

WALKER (*much ruffled*): It's not in my contract; if the men have their dinners on specifications they'll have to provide them. I won't.

TODD (*aggrieved*): Well stop the wind a-blowing then. 'Tain't my fault. I'll take and leave the job if yer like. How can I 'elp the blamey wind?

BOLTER: Never mind, Bill, there's a copy in my office. Go and look at that. (*Hands him a key.*)

(*Todd goes out.*)

H'm. (*Aside.*) I feel like a bottle of stout and some oysters. (*He moves to a newly built window and calls.*) You haven't done anything about these sills, I see, Uncle. I told you the governor would probably have them out again if I told him they were only American oak.

WALKER (*frowning*): Oh, well; they're not American oak; they're all right, you couldn't tell the difference. Come and have a pot of beer.

BOLTER (*dubiously*): Well, I'm ready for a drink, Uncle, but I ought not, strictly speaking, to approve these sills when—

WALKER: Oh, they're all right, bless you. I never saw a better lot of sills in my life; come along round and have a pork chop and a pint of porter; I've felt ready this half hour. (*Pulling him away.*)

BOLTER (*hesitating*): Yes, Uncle, I should like

a snack—some oysters, perhaps, but I'm not at all sure—

WALKER: Well, come along and have a dozen and a bottle of stout.

(*They hurry out. Half-an-hour later they return, meeting Mr. BATES, who has just arrived to view the work.*)

BATES: Just let me see the Specification, Mr. Walker. (*WALKER is embarrassed, and BOLTER interposes.*)

BOLTER (*grimly*): An unfortunate misunderstanding on the part of an inexperienced workman, sir. The Specification blew away at about 11.30 yesterday morning, and was found about one o'clock by an enterprising plasterer, who, I am informed, dined on it.

BATES: What! Ate the Specification?

WALKER (*affronted*): Ate it? No, not on my building. I can tell you sir, I pay better wages—

BATES (*irritably*): Well, Bolter, let me see yours. Quick, please.

BOLTER (*calling*): Bill. Bring me that Specification.

WALKER (*indignantly to BATES*): Sir, I take a pride in my men, and sooner than have it thought they were starving with hunger, I—

BATES (*testily*): Yes, Yes, Yes, Yes, Mr. Walker.

(*BILL TODD enters with a lump of white plaster, and looks on.*)

WALKER: Well, sir, I want you clearly to understand that if I knew there was any man on my building so hungry he couldn't keep his teeth out of the Specification—

TODD: He wouldn't get 'em fur into this one. (*Holds out lump of plaster in which is embodied the Specification.*)

BOLTER (*grimly to BATES, taking the lump of plaster from TODD and holding it at arm's length*): Another unfortunate misunderstanding on the part of an inexperienced workman, sir. About half an hour ago I lent my Specification to the foreman here, and it seems—

TODD: Soon as iver I turned my back it blowed away agin. 'Tain't my fault. (*Walks off.*)

BOLTER: The plasterer found it, and, having had injunctions not to have his meals off it, sacrificed it in the interests of the Profession. It's hard set now.

BATES: You must make it good Mr. Walker, that's all.

WALKER (*aggressively*): I want you, sir, to—

BATES (*emphatically*): There is nothing more to be said, Mr. Walker. I can't hear you.

WALKER (*doggedly as before*): Just so; just so; but what I mean to say is that if I thought that plasterer hadn't vittles enough to get a proper catch on his stomach—

BATES (*sharply*): Mr. Walker, the matter is ended.

WALKER (*growing loud and indignant*): Sir, it ain't ended, by leave, if you'll excuse me. Sir, I'm an honest man I tell you, as has been a member of the council of this town, sitting on the open drain down by the quay, just as my father was four-and-thirty years ago, and if you don't believe me—

BOLTER: Draw it mild, Uncle.

BATES: Mr. Walker, I insist—I say I insist—

WALKER (*flushed and noisy*): And I say if you don't believe me, there's my wife's uncle has got a testimonial given to him by my father, who went to church regular same as I do, in a golding frame, sure as I'm standing here, an honest builder of this town, as Bolter knows, and will tell you if you ask him, that when prices is good I do my work as cheap as anyone, and when prices is bad, I expect to be paid for the very superior material which I always supply, and you can.

BATES (*angry*): Mr. Walker, I will not listen. (*Strides off.*)

WALKER (*looking round baffled*): Where is he? Where's he gone?

BOLTER (*in a pacifying tone*): Oh, cheese it, Uncle; cheese it, Whew! (*Aside.*) I think I could do with a bottle of champagne after that. (*He moves to window and taps on sill with his finger.*) Uncle, touching the matter of these sills now?

WALKER (*bristling*): Now look a-here, you let them sills be, will you. You've had beer out of 'em, you've had champagne out of 'em, pork chops you've had, and stout and oysters over and over again. I won't stand another half-pint on 'em. There! Now then!

BOLTER (*placidly*): Very well, Uncle; they ain't what they should be, but they're not a bad lot of sills on the whole as you say. Now what I have particularly to object to is that last lot of milled lead. It is not 7lb. lead, Uncle, and your plumber is cutting the gutters from it.

WALKER: Well, now all the years I've been a builder I never heard the like of that. I've never used heavier than 6lb. lead to a gutter—never. I stake my professional reputation—

BOLTER: Yes, Uncle, I know; but the Specification says—

WALKER: Oh, well, I'll see to that very soon. I feel like a glass of sherry and biscuit; what do you say? (*They move off.*)

BOLTER: Never mind the biscuit, Uncle, and we can have fizz.

MESRS. FRANCIS W. BEDFORD, A.R.I.B.A., and Sydney D. Kitson, M.A., have removed their business premises from 12, East Parade, to Greek Street Chambers, Leeds.

HOUSE IN RUE CONDORSEN, LISIEUX. DRAWN BY J. EDWIN FORBES.

ORIEL AND BAY WINDOWS.

THE discussion on Mr. Paul Waterhouse's paper, read at the last meeting of the Architectural Association, was opened by Mr. Leonard Stokes. Mr. Stokes said he felt slightly annoyed at Mr. Waterhouse's justification of the jerry builder's bay, which he appeared to think an economical method of gaining floor space. Mr. Stokes rather doubted this, as he thought the size of the house could be increased more cheaply without the use of the bay. He had passed along a street that day in which there were fifty-five bays exactly alike, in a row; such bays were useless. There was one form of bay Mr. Waterhouse had not execrated as much as he might, and that was in the form of a gulf rather than a bay. It was generally seen bulging out at the corner of a villa, and was, both internally and externally, a most objectionable feature. He strongly advised that no one should attempt an angle bay of any kind. Of course such a bay could be placed near an angle, for although architects of the past used angle bays more or less successfully, the problem was a most difficult one, and seldom quite satisfactory. He would go a step beyond Mr. Waterhouse's statement that it was not absolutely necessary to use a 45 deg. set-square when designing a bay on plan, and say *never* use the 45 deg. set-square thus, although it could sometimes be done successfully. He agreed that if they

could satisfactorily design that difficult feature, a bay, they could design anything; and if they could not design a bay they had better give up Architecture altogether. Simplicity and proportion were the foundations of all design, and if the bay was designed in good proportion, without much ornament, it would be satisfactory, but if not in good proportion, no amount of ornament would make it look well. Mr. Stokes proposed a vote of thanks to Mr. Waterhouse.

Mr. F. T. Baggallay, in seconding the vote of thanks, said he thought it would be a good service to have the derivations of "oriel" and "bay" definitely defined, and useful if architects could agree to limit the meaning of oriel to a bay that did not go right down to the ground. He thought it was safest to carry a bay up; if not the whole height, at least two or three floors, and if possible to repeat it. In regard to the roof of a bay rising above the normal level of the roof of a building, he thought it was a most dangerous thing to attempt. With a roof of a comparatively small feature such as a bay, rising above the normal level of a roof, it would attract the whole attention, and dwarf the general composition.

Mr. H. H. Statham, in supporting the vote of thanks, said he thought bay windows were introduced, not so much to obtain a larger floor space, as to make the tenant think he had got it. If the bay windows were taken away the front wall could be advanced a little, and the floor, too, but without the bay the tenant would not think he had such a large and commodious room. He had always understood the word "oriel" to mean the class of bays which did not come down to the ground. As to the question of angular

or segmental bays, he was in sympathy with Mr. Waterhouse's affection for the segmental bay, and he thought, during the reading of the paper, of a house at Eastbourne, near the east end of the sea-front, which had a large, wide bay window of a rather small segment of a circle, giving at once a look of distinction to the house; it was not the ordinary commonplace canted bay window. Sometimes a very shallow segmental bay would give that sort of distinction to a house, without taking up inconvenient room. Of this, there was rather a good example in Walbrook. With regard to the canted bay, it was an important question as to the little return joining the main wall, always seen in the builder's bay. There was often a better effect in carrying the canted side right into the main wall without a break.

Mr. Alexander Payne expressed the opinion that the reason why many bays would be used in London in the future lay in the provisions of the London Building Act, whereby if in a new street one builder established a line of frontage, another requiring larger rooms, would place bays out beyond the frontage line to obtain his object.

Mr. Thomas Blashill said he had hoped Mr. Waterhouse would have told them exactly what an oriel and a bay were, for when a case came before a magistrate it would have been useful to turn to the paper for a reliable definition. The section of the Building Act of 1894 relating to bays was inserted with the idea that some variety would be introduced into the streets of London as a result. It was thought that the houses in the streets were too flat, and as application was constantly being made to the London County Council for permission to put in a harmless bay window, it was thought best to put a provision in the Act, so that people could get the bay window running up from the ground, which was what the Act meant by "bay," and the oriel. There was the aesthetic reason for the bay in improving the appearance of a row of houses, but there was a practical side in obtaining a convenient space in small houses for placing the inevitable table and family bible, &c. He was very much in favour of bay windows if employed properly, notwithstanding what had been said. The bay window broke the line of front and enabled the occupants to look up and down the street.

Mr. Arthur S. Flower said he had hoped that the lecturer would have told them a little more about the intervals between supports in the case of segmental bays, because blunders were so often made about that. He also wished that more had been said about rectangular corner bays; for his part, he wished they had been prohibited by the Building Act.

Mr. H. A. Satchell was of the opinion that the redeeming feature of a builder's bay was the change of prospect and aspect afforded to the occupants. It was a great advantage in a house facing due south to be able to look east and west. He would rather live in a house with a bay than in one without.

Mr. G. H. Fellowes Prynne, the President, agreed with the last speaker in the advantage of bay windows in houses facing south. He could not agree that an angle bay should never be used. In an angle bay, three sides of the ground could be viewed, and with an octagon bay at an angle, a very pleasant prospect could be obtained.

The vote of thanks to Mr. Waterhouse was passed.—Mr. Waterhouse, in replying, agreed with Mr. Stokes that the 45 deg. set-square was often unfortunate.

At a recent meeting in aid of the fund for the restoration of Peterborough Cathedral, a resolution was passed pledging the meeting to support the efforts of the Dean and Chapter to complete the work before the close of the century. The Dean announced that during the past sixteen years a sum of £42,705 had been spent on the cathedral, in addition to gifts for the interior to the value of £28,000. They still required £10,000, and towards this £1000 was already in hand.

THE BASILICA OF BETHLEHEM.

(A FRAGMENT.)

A FRAGMENT OF THE BASILICA OF BETHLEHEM. DRAWN BY GEORGE JEFFERY.

THE BASILICA OF BETHLEHEM.

BY GEORGE JEFFERY.

THE Basilica of Bethlehem remains rather an architectural puzzle. A tradition exists that the church, as we now see it, was built in the fourth century. The question is how far such a tradition is borne out by facts. The building appears to be planned nearly east and west, with the altar at the east end. Such a plan is, I believe, unknown in the basilican buildings of the early centuries. Certainly an altar placed at the east end of a church would have been quite exceptional in the city of Rome, or its immediate dependencies, in the fourth century. Even the later churches of St. Clement point westward. Was it, then, a custom of the Oriental Christians to build their churches pointing eastwards. I can find no very early examples. The Basilica erected at Jerusalem, of which the remains of the east front are still in existence, certainly did not. The circular church on the Mount of Olives, of this same period, is hardly sufficiently known at present for us to be sure about the position of the altar. Nothing seems to be known of the Basilica of Antioch, built by Constantine and Constantins. The same may be said of so many other examples of early churches, known to us now only by name. But in the case of the Cathedral of Tyre, so carefully described by Eusebius in his celebrated sermon, we again have an example of early church arrangement with the altar always at the west end according to the prevalent Roman model. Although this question of ritual arrangement may not be conclusive in fixing the date of a building, still I think there is very much in the case of the Basilica of Bethlehem to suggest that it is a building of much later date than the fourth century. The extreme classicism of its details must then be accounted for by the consideration that at a time when Europeans were building the Romanesque churches of France and the Rhine, or the elaborately inlaid marble buildings of Lombardy and Tuscany, there survived in Syria, a style closely copied from the recognised classic, even after the introduction of

the Byzantine style. In the case of the the fragment of a west front to the basilica, of which I have made careful drawings, the survival of classical design is remarkable, much more so than in the interior of the building, which although retaining regular "Corinthian" columns for the double nave colonnades, of ordinary classical proportions and detail, is singularly like a northern Roman basilica of ninth or tenth century date.

I have only been able to trace the lower portion of the basilica front with its three doorways. The upper part of the wall rises to about 12ft. or 14ft. above the cornice of principal door. These upper courses of stonework may be, as they appear, in their original position. In that case the colonnaded cloister which is supposed to have formed an atrium in front of the church can hardly have run in front of the entrance wall, it may have been merely a three-sided colonnade like the famous atrium of the Church of the Sepulchre at Jerusalem. Of this supposed atrium I have not been able to see any traces, but the ground of the piazza in front of the Basilica has been so much raised with accumulated rubbish and graves that it would be necessary to excavate to find any traces of such western buildings.

The whole of the front, like the rest of the church, is built of the local hard red and white limestone, and both it and the church are evidently of the same age.

The documentary evidence as to antiquity of the Bethlehem Basilica is scanty. The first reliable date in its history seems to be A.D. 1101, when Baldwin I. was crowned within its walls. In 1158 the mosaics, still visible in a ruined state, were put up by the Greeks and Latins conjointly. In 1213 there seems to have been some sort of restoration of the building. In 1447 the church was repaired by Philip of Bar, and again, in 1478, an architect was sent for the same purpose by Pope Pius II., at which time the Latin entrance into the crypt seems to have been constructed. In 1628 Philip IV. of Spain sent 30,000 ducats for repairs, and finally, in 1719, the roof over the whole building was reconstructed by the Franciscans. As a consequence, there is very little remaining of so ancient a date as the first Crusades except the plan of the building, its colonnaded aisles, this fragment of a west front, and the few scraps of mosaics. The three apses at the east end seem to me of the same date as the rest of the building,

although as all the doorways and windows have been very much transmogrified in recent ages, one finds it rather difficult to form an opinion under the circumstances.

The dilapidated stone font seems to be a Gothic feature. It is hewn out of a single block of the hard red limestone of the district. Like all the buildings of the Palestine hill district, these remains at Bethlehem betray the miserable method of construction which seems to have prevailed in all ages. Mortar, as understood in Europe, can hardly be said to exist. Lime is plentiful enough, but as there is only limestone mud to mix with it, there is nothing permanent about such building. The wonder is that any vestiges of monumental building remain from so ancient a date as the Crusades. The few remains of a supposed earlier date carry but a doubtful reputation, when we consider these facts.

From the foregoing it would seem probable that the Basilica of Bethlehem may be claimed as a monument of at least the ninth century. Several examples may be found in Italy, such as the Basilica of St. Cecilia and St. Maria in Dominica, and SS. Apostoli, Florence. Is it not probable that this church with so strongly marked a character of Roman work about it, may have been built in that period of contention between Greeks and Latins immediately preceding the Crusades, as a protest against Byzantine ideas. As a fact there seems to be no documentary or monumental evidence to settle the question, we can only judge by comparison with other buildings in such a case.

THE consecration of St. Edward's Church, Birmingham, has recently taken place. The church and schools were bought from the Presbyterians for £1700, and given to the Church of England by the Rev. Stanley Gordon Collier, now vicar of Burrington. The rebuilding and refurnishing cost upwards of £1300.

THE portion of Sir William Richmond's scheme of mosaics presented to St. Paul's Cathedral by the Merchant Taylors' Company has been unveiled in the presence of the Dean and Chapter and many members of the Company. The space utilised is one of the four concave quarter domes over the lectern in the north-west part of the dome, and represents Christ reigning from the tree.

SKETCH OF ROOF OVER
CROSSING - BETHLEHEM
PROBABLE DATE 1719

THE BUILDING TRADES CONTROVERSY.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Builders have themselves to thank for the dearth of skilled labour. They have for years past systematically shirked their responsibilities to their contemporaries and successors in the matter of training up young workmen, refusing to be "bothered" with apprentices, and substituting machinery for the more unskilled parts, compelling the old trained workman to finish parts that did not pay to "machine." Architects have assisted in this short-sighted policy by inserting clauses to the effect that no boys, improvers, or under-priced labour shall be employed upon their buildings, thus ensuring that no lad should get practical acquaintance with his trade. The statement that it costs more to build than formerly is disproved by the fact that almost anyone, from the small shop-keeper upwards, can afford to purchase a house, and where there is a parallel increase in cost, it will be found due rather to the numerous conveniences and luxuries now introduced, and to the advance in the prices of material (bricks nearly 50 per cent.) than to the prime cost of labour. Foremen who are competent craftsmen will enjoy the respect, and have no difficulty in enforcing the obedience of the average workman, but foremen are too often selected, not for their knowledge and experience, but for an imposing presence or a propensity for bullying, euphemistically termed "getting the work

done cheaply." There are scores of these incompetents in responsible positions in London, making shift to delude their employers by employing "deputies" to do the work that they are supposed to carry out, and oftentimes bringing bankruptcy upon their employers, and discredit upon the workmen, who have to carry out their orders. Workmen, knowing that they will be made the scapegoats for all the errors and mismanagement of those above them, not unnaturally are mutinous or independent when they find a bully or duffer set over them, and are either "insolent" or turn up their jobs, if trade is brisk, seeking fresh fields and pastures new.

Yours, etc., X.

A DECAYED WELSH CHURCH.

THE late Professor Freeman spoke of the buildings of Llantwit Major as among the most striking in the kingdom. "Through a succession of civil and domestic structures of the sixteenth and seventeenth centuries," he added, "the traveller gradually approaches the grand group composed of the church and the buildings attached to it." Its church has been well described as "a most remarkable accumulation of distinct buildings." The work includes specimens dating from any time within the last ten centuries. There are the ancient Celtic crosses of Howell, Iltyd, and Samson. Portions of the tower supports are Norman, and the ancient font, with its external fish scale ornamentation, is of the same date. The church itself is thirteenth century, and

A WONDERFULLY ELONGATED PILE

it is, being no less than 202ft. from end to end. The extreme eastern portion of the edifice was formerly the monastic church. It is now divided from the western or parochial church by the central tower, while still further to the west is what may be called the third church, now in ruins, which was formerly the Lady Chapel, built in the fourteenth century. It is to repair the western portion of the fabric that the vicar is now endeavouring to raise the sum of £1000. The restoration will be carried out under the supervision of Mr. G. E. Halliday, F.R.I.B.A., who had charge of the restoration work of Margam Abbey Church. The church and churchyard abound with ancient relics. In the eastern part of the church are

TRACES OF OLD FRESCOS.

Outside, opposite the south porch, is a fine cross from which the head has long been missing. In this respect it has shared the fate of Porthkerry, Gilston, Pyle, and many other Glamorganshire crosses. In the fifth century St. Iltyd went to Llantwit, and in company with Germanus reorganised a college, to which the sons of the nobility came as students. It was Iltyd who gave his name to the parish, for Llantwit is none other than a corruption of Llan Iltyd, or the Church of Iltyd. With such a past it would be a disgrace were the present generation to allow the old building to fall into decay, and it is to be hoped that the appeal of the vicar will meet with the ready response that it deserves.

At a meeting of the Court of Common Council, at the Guildhall, attention was called to the dangers of Ludgate Hill Station, and the question referred to the Streets Committee, with power to communicate with the Board of Trade. The station was built many years ago, of wood, and is quite unfitted to meet the demands of the passenger traffic, which has enormously increased of late years. Owing to the lack of proper accommodation, the staircases are frequently blocked with passengers. Ludgate Hill Station is stated to be the worst in the wide world.

PLAN OF THE BASILICA.

FIREPROOF CONSTRUCTION IN AMERICA.*

By R. W. GIBSON (New York).

MR. GIBSON'S paper commenced with a brief sketch of the development of fireproof construction in the United States, showing that the first efforts had been disappointing through lack of perception of the difference between incombustible materials and fireproof material. The exposed iron systems had failed signally, collapsing to the heat of burning fittings, furniture, and stored goods. The modern system had developed from these experiences upon an ancient pattern of floors composed of wooden beams buried in masonry, using steel and iron instead of wood, and

PERFECTING AND SYSTEMATISING FIREPROOF PROTECTION.

The latest phase was the entire elimination of the combustible materials hitherto used for doors, floors, architraves, &c.; the selection of materials fire-resisting as well as incombustible, and the use of these to protect others which must not be used unless so protected. Materials most available were steel or iron for strain-bearing purposes, and brick or terra-cotta and plaster to clothe and protect the metal. Masonry materials required careful selection, some granites and marbles being liable to destruction at the earliest blasts of a severe fire. Fireproofing must be such that, when the fire occurs, it will not be washed off by the heavy torrents of water thrown upon it by the modern fire engine. Of the several classes of fireproofing accumulated experience pointed to the infinite superiority of fire-resisting terra-cotta, which had always performed the duty required of it. Probably 95 per cent. of existing fire-proof work was of terra-cotta construction.

THE STRUCTURAL IRON WORK

might be divided into three classes, suited to as many types of fireproof buildings. First, the building of ten stories or less, erected by the old methods of supporting walls and superimposed columns carrying floors and roof, and with only small beams and girders or occasional independent trusses. Secondly, the building of more than ten stories, which accumulated such strains upon its walls that they must be reinforced by posts to carry the girder loads, and in which the walls required such mass in their lower parts to support their own upper parts that the metal first introduced to support the floor girders was reinforced and called upon to support the upper walls. This was the so-called skeleton construction. At a height exceeding twelve stories, or when exposure to wind and other strains was great even at this height, the ordinary attachment of columns and girders was abandoned, and horizontal stability supplied by

RIGID RIVETING OF ALL CONNECTIONS OF POSTS

one upon the other, and of girders to posts and beams to girders, and by the addition of bracing in ties and struts and gusset brackets, thus developing the so-called cage construction, wherein the steel receives and transmits all loads to the foundations; and the walls have become mere panels, not only without vertical loads, but without transverse bracing strains. Thirdly, an intermediate type of building where all the internal structure and all the floor loads were supported upon columns, some being placed in the outside walls, the outside walls being made of self-supporting thicknesses in cases where architectural treatment demanded sufficient mass for the purpose, and where the foundation presented no difficulty. In buildings of the third type, erected

in many stories and let for business purposes, almost perfect fireproof qualities had been achieved. In such buildings there was no danger to life from fire, or of the fire spreading from the room where it first occurred. This type had become systematised by custom and experience, so that its structure was uniform throughout the country. The floor loads are supported upon columns of rectangular shapes of rolled steel, the outer columns being

SET IN THE OUTER WALLS IN GROOVES,

close-fitting but without bond, so as to permit of unequal movements and settlements and contraction. Girders are of rolled steel, built and riveted for large sizes, and of I-beams for smaller (24in. and under); they are all riveted to the side columns, so that these may be continued right through the height of the building in practically one length. Bracing is done with gusset plates and angles. Beams supporting the floors are small (8in. or 9in.) rolled steel I-beams, laid 4ft. apart. The size of the beam and spacing arise from the use of the terra-cotta arch, of from 8in. to 10in. in thickness. These arches, which are very economical, very adaptable, and elastic in their application, are made of hollow terra-cotta blocks, with joints inclined at a fixed angle. The blocks are of three patterns—viz., the springer, which rests on the flanges of the floor-beam; the intermediate blocks, which are all cut to the same inclination; and the key-block, with the sloped joint on both sides. The work is set upon a centering consisting of simple scaffold boards hung 1½in. below the soffits of the iron beams; upon this centering the arch-blocks are laid, and then jointed and flushed in cement. When the work is set the centering is removed to a new panel, so the work goes on continually. Upon the arches

A LAYER OF CINDER CONCRETE

is deposited, and upon this the finished floor, consisting of paving or tiling, or a composition of a concrete nature, or sleepers and wooden floor. For buildings having floors weighing from 75lb. to 95lb. dead load per foot, and supporting live loads from 75lb. to 150lb., the distance between the main girders would be between 14ft. and 18ft., which being a convenient size for a single office is also taken as the unit of room width and the space allotted in the outer walls to a pair of windows. The roof is constructed with arches, the same as the floors, except that sometimes the steel beams are laid to the necessary pitch of about half an inch to the foot, so as to avoid the weight and expense of filling, which would be necessitated by level beams and arches. The thickness of the walls is about two-thirds that required for walls supporting the floor loads, and they are secured to the metal framework so as to receive its assistance in resisting horizontal wind pressure. Thicknesses of walls for buildings of varying height and construction were quoted. The thickness necessary to resist the weather is found to be 12in. at least of brickwork, with terra-cotta interior furring. The furrings are hollow terra-cotta slabs or tiles 2in. thick, and 16in. by 8in., or other convenient sizes, built up against the inside face of the wall and secured with iron where necessary. The

INTERIOR OF THE STEEL FRAME

is protected over all its exposed surfaces by 2in. of terra-cotta furring. The girders are protected by slabs of terra-cotta, secured with hooks and bars and wiring, and usually getting their outer form by means of metal lath upon light iron bracketing to receive the finished plastering. The lower portion of walls and columns are frequently finished with marble slabs 1in. thick, or with tiling. Those methods are preferable which place the fireproofing material close to the metal, and preserve numerous and frequently broken air spaces in their own substances. A greatly improved and considerably cheaper column protection can be made by using one coat of metal lath and cement in contact with the column, and a second coat furred out from the first upon metal lath upon light iron bars, so as to preserve an air space between the two thicknesses of cement. This protection is finished with hard plaster, proof against the fire-hose.

Partitions are built after the structural steel is protected. The best are of terra-cotta blocks, 4in. thick for average heights, 3in. for moderate heights, and 6in. for great heights of story. They may be stiffened

WITH ANGLE IRON FRAMING,

but show extraordinary strength when well set in Portland cement. Minor partitions, and sometimes all the partitions except those next corridors, are frequently built by using light angle iron posts or quarters covered with metal lath, and plastered either like the old-fashioned wood plastered partitions, or sometimes with very thin posts and one sheet of metal lathing only, so as to make a solid plastered partition about 2½in. thick. Three-inch tile partitions dry quicker and cost only a little more. So far the building has nothing combustible in its construction, and the tendency is to more and more reduce the amount of woodwork admitted after this stage. Wooden floors are permitted, but doors and architraves should be of sheet metal, wooden cores being tolerated. Window architraves and jambs should be of hard plaster, and window frames and sashes of chemically-treated fireproof wood or of metal. Windows, in internal partitions and doors should have wired glass. Office furniture should be non-combustible, e.g. metallic book-shelving, desks, cabinets, letter files, &c. In ordinary fireproof buildings, halls, stairs, corridors, and elevator shafts are

ENTIRELY INCOMBUSTIBLE.

The author next discussed the principal sources of fire, and the manner in which it spreads—the latter a point but little understood, except by firemen; the effect of heat upon metal; an alternative system of steel construction; various forms of floors in use, and the merits of porous terra-cotta, a material preferred by many experts. In conclusion the Paper dealt at considerable length with the principles to be applied in calculating the strength of beams, girders, columns, and foundations in proportion to the loads required to be borne, quoting the building regulations respecting the matter in New York and Chicago, and the differences of opinion and practice existing among architects there in regard to column and foundation loads. The author's own calculations for a first-class bank and office building designed by him and recently erected in Syracuse were given as follows:—

Load on all beams	= total dead load + 70 lbs. per ft. live load.
Load on all girders	= total dead load + 60 lbs. per ft. live load.
Load on columns of three upper stories	= total dead load + 60 lbs. per ft. live load.
Load on columns of remaining stories	= total dead load + 40 lbs. per ft. live load.
Load on foundations	= total dead load + 20 lbs. per ft. live load.

Among a large number of illustrations to the paper were a set of working drawings and specifications and strain and load diagrams of the Syracuse bank designed by Mr. Gibson, which afforded an interesting example of this class of practice in the United States. Photographs showing the building in course of erection at various stages were shown by the lantern. These were followed by a series of lantern slides reproducing details of construction of a thirty-story building, and photographs of the bank at Syracuse, and three columns after fire tests, the latter being lent by Mr. E. O. Sachs.

Miss Ethel Mary Charles (Probationer, 1893; Student, 1895; Qualified, 1898), of York Street Chambers, W., has been elected an Associate of the Royal Institute of British Architects. The election was made at a business meeting which preceded the general meeting on Monday night. Considerable interest was evinced in the question, and the attendance of members was exceptionally large. The Council of the Institute favoured Miss Charles' election, and a large clique of members who object to the Profession of Architecture being opened to women competitors opposed it. Miss Charles, however, being fully qualified as an Associate of the Institute, the opposition failed to defend the position.

* A paper, entitled "Fireproof Construction of Buildings in the United States," read before the Royal Institute of British Architects, on Monday, December 5th, 1898.

THE CÆDMON CROSS.

THE Memorial Cross, of which we give two illustrations, is that recently unveiled at Whitby by the Poet Laureate, in honour of Cædmon, the father of English sacred poetry.

"There was," said the Venerable Bede, "in the Abbey of Hild, a certain brother who had an extraordinary gift, and whose name was Cædmon. Sweet and humble was his poetry; no trivial or vain song came from his lips. Others after him strove to compose religious poems, but none could vie with him, for he learned the art of poetry not from man, nor of men, but from God."

John Richard Green, the historian, after speaking of Cædmon's work as "the first great song that English singers had wrought since our fathers came to Britain," adds "the memory that endears Whitby to us is not that of Hild, or of the scholars and priests who gathered round her, the name which really throws glory over Whitby is the name neither of king nor bishop, but of a cowherd of the house."

This poor cowherd was inspired to be not only a poet, but a great missionary to the people of Northumbria, for his Bible paraphrase in verse helped to evangelise the people, and he may be said to have sung the Gospel into the hearts of pagan Anglia.

Though his name is attached to a large number of poems, it is believed that only nine lines of his original authorship remain to us at this time. They are found in manuscript on a flyleaf of the Moore Bæda at Cambridge, and they are very precious, because they are the opening lines of Cædmon's first poem, his "Praise of Created Things."

Canon Rawnsley, to whom literary England is indebted for the idea of doing honour to the first Christian Anglo-Saxon poet, at the place of his inspiration, life and death, gives us the following account of the cross:—

"It stands," he says, "at the most beautiful point of view in the old churchyard of St. Mary's, Whitby, close to the top of the steps that lead to the parish church. It is seen far and wide.

"It is hewn out of the hardest fine-grained sandstone that could be found in Northumberland; stone which the Romans used for the building of Chotterford Bridge, near the Roman Wall.

"Its height is 19ft. 6in.; it is a Monolith as far as the shaft goes, and is of the ancient Anglian type, based in design and proportion upon the four great memorial crosses erected in Cædmon's time, which are extant to-day—viz., the Ruthwell, Bewcastle, Rothbury and Hexham crosses."

Mr. Charles Hodges, of Hexham, who has spent his life in the study of Anglo-Saxon stones, was the designer, working at Canon Rawnsley's suggestion with consummate care and determination not to slavishly copy but to produce a nineteenth century work of Art with true Anglian feeling. Mr. Robert Beall, of Newcastle-on-Tyne, was the sculptor.

On the eastern side of the cross are four panels—Christ in the act of blessing, David playing the harp, the Abbess Hild, and Cædmon near the stable, inspired to sing his first song. Beneath runs the inscription, "To the glory of God, and in memory of Cædmon, father of English sacred song. Fell asleep hard by A.D. 680."

On the west side is carved a double vine, symbolical of Christ, and in the loops are found figures of the four great scholars trained at Whitby in Cædmon's time, under Abbess Hild, namely, Bosa, Aetla, Offfor, and John. Beneath are inscribed the first nine lines of Cædmon's Hymn of the Creation, as preserved to us on the fly-leaf of the Moore Bæda in the Cambridge Museum. These have been carefully rendered into English by the Anglo-Saxon professors at Oxford and Cambridge, and run as follow:—

Now must we praise
The Warder of Heaven's realm,
The Creator's might,
And His mind's thought:—
The works of the glorious Father,
How of every wonder,
He, the Lord eternal,
Ordained the beginning;

He first shaped
For the sons of men
Heaven as their roof,
The Holy Creator;
Then the middle world He,
Mankind's Warder,
Eternal Lord,
Afterwards prepared,
The earth for men,
Lord Almighty.

That was the first song Cædmon sang.

The runes of the same nine lines are also carved upon the border of one of the sides of the cross, as is the case at Ruthwell, and the same inscription appears in Saxon minuscule on the border of the opposite side.

The two sides of the cross contain, respectively, a conventionalised English wild rose with birds and animals, and an apple tree, emblematical of Eden, conventionalised also with other birds and animals—somewhat after

THE CÆDMON CROSS AT WHITBY.

the manner of the treatment of the sides of the Bewcastle and Ruthwell Crosses.

The symbolism of these sides is intended to teach that all gentle life under the protection of the Cross of Christ should abound and be happy. A harp is seen at the foot of the Tree of Life as emblematical of the harmony which Christ restored, and as suggestive of the immortality of Christian song, and the wild roses, the badge of St. George, spring from an old Iona cross, typifying that the life of the Christian Church ran on and bore fruit and flower at Whitby.

The head of the cross contains the Agnus Dei, and the symbols of the four evangelists on one side; on the other side, bosses and knot work; whilst the Dove is represented as descending, emblematical of the Holy Ghost, the Inspirer.

The total cost of the monument was £260.

ARTESIAN WELLS.

THE deepest and most productive artesian-bored tube well ever sunk in London has just been completed for a large and important printing works in Clapham Road. The well is 425ft. deep, and is producing 840,000 gallons of water per day, and during the boring operations some most interesting discoveries were made showing the various strata which underlie that part of London. This achievement, says the Daily Mail, is all the more unique because the water is raised by compressed air, entirely dispensing with all pumping and complicated machinery. The well was sunk by Messrs. C. Isler and Co., consulting engineers, Bear Lane, Southwark. Their explorations into

THE DEEP UNDERLYING SOILS OF LONDON

consequently exceed those of any scientific association. There is no doubt that the old-fashioned sunk shafts and dry wells have had their day. The old-fashioned wells only drew upon the surface supply, and were always breeders of contagion and disease. Some of the more successful wells in London are those of Messrs. J. Shoolbred and Co., at Tottenham House and Gower Mews, which produce 10,000 gallons a day; of Mr. E. T. Pink, Bermondsey, where wells 250ft. and 300ft. deep produce an equally large flow; and the Islington Vestry wells at Hornsey Baths will soon yield from 20,000 to 25,000 gallons per hour. The whole theory of Artesian Wells is based on the natural law that water will seek its own level. Geologists say London is a great basin. The bottom of the basin is hard chalk, a hundred or more feet in thickness. If you will imagine a great bowl, reaching from Richmond Terrace to Greenwich, with a beautiful white chalk bottom, you will realise exactly what this London water basin is. Water percolates through the upper strata of sand and clay until it strikes this impervious chalk. That holds it. This chalk stratum varies in depth from Westminster, where it is 240ft. beneath the surface, to New Cross, Old Kent Road, where it crops out above the surface. The deeper it is the larger is the amount of water obtainable. Wherever you tap that chalk bottom you get water, and that water will

RISE IN THE TUBE

to the level. All that the well sinkers do is to force it the remainder of the distance to the surface. In the case of this new well, and the one being sunk in Hyde Park Court, compressed air is used instead of a pump. This is done by sinking one tube inside another. There is a vent at the bottom of each, so that the air pressure of 100lb. an inch forces the water in a magnificent flow to the surface. A well near the National Gallery, in Trafalgar Square, supplies all the public buildings in Parliament Street and the Houses of Parliament. The new one in Hyde Park Court will supply all the mansions about Sloane Square. The Marquis of Salisbury presented a well, 300ft. deep, to the Corporation of Hatfield as a Jubilee gift. It supplies the town with 7200 gallons an hour. The Manchester, Grosvenor, and Langham Hotels now have their own wells, and many other hotels are preparing to follow their example. The artesian well experts say that there is enough water in the chalk basins from Purfleet to Grays, along Essex Ridge, to supply the whole East End of London, and do away with all fear of water famines. The Colne Valley would supply all the rest of London. As the cost of pumping by artesian process is only 1½d. per 1000 gallons, against the water company's charges of from 4d. to 6d. per 1000, the value of these wells is apparent, but of course, the initial expense of sinking the well must be taken into account.

THE Bower Schools, Norton Malton, are being warmed and ventilated by means of Shorland's patent Manchester Grates, which were supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

December 7th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

CONSIDERABLE damage has been caused by the recent gales to the foundations of the old castle at Sandgate, and it has been found necessary to support by baulks of timber that portion of the structure which faces the sea. The castle stands on the sea-shore, and is a fabric of great antiquity, which was first mentioned in the reign of Richard II., when that monarch directed the keeper of the castle to admit Henry of Lancaster (afterwards Henry IV.), with his family, to "tarry there six weeks." When Queen Elizabeth visited this coast in 1588 she was entertained and lodged in the castle. The building is an object of considerable interest and attraction in the town.

PROFESSOR CHURCH's new method of cleaning the paintings in the Palace of Westminster is very ingenious, and withal simple. It is believed to be thoroughly effective, but its efficacy will be put to the test when the cleaning of the beautiful frescoes in the corridors leading to the two Houses is undertaken. An elementary form of the invention was recently tried in the Royal Gallery, but it did not then prove satisfactory. It was sent back to the maker, that certain suggested improvements might be made in it, but even with these it did not come up to the expectations or wishes of the professor. It was sent back once more, and it is this latest form of the apparatus which will be set to work upon the Westminster frescoes. The old traditional bread-crumbs are still the basis of the idea. They are, however, applied by a manual air compressor, from which a jet of air charged with the crumbs is directed against the picture. It is still, however, in the stage of uncertainty.

FACTORIES exist in certain towns in Europe for the manufacture of all kinds of works of art that are likely to attract the collector. Modern articles of china are stamped with old marks so cleverly that even experts have been deceived. Arms and armour are treated with acids which eat away the metal, thus producing the same effect as the ravages of time. Carved ivories are stained with oils to make them yellow, and are subjected to heat to make them crack. Pieces of furniture have holes drilled to represent the worm holes, and so on, until there will in time be very little in the way of curios which are in themselves really curious. Paris is one of the greatest strongholds of this class of forgers. Forgeries in all works of art very rarely get into the dealer's hands. As a rule they are sent to auction rooms. Many amateurs have an idea that they may pick up a priceless work of art or curio for a mere song. That is the chance for the forgers. They know all this and work accordingly, and thus the amateur is deceived. The

spurious curio makers haunt out-of-the-way auction rooms, where amateurs look in with the idea that nobody but themselves can know of the room in question. The sale takes place, and they come away with a gem, so they think, and are perfectly happy until undeceived.

A COLLECTION of pictures and door decorations by Fragonard is now being exhibited at Messrs. Agnew's Gallery in Bond Street. These canvasses were originally executed by commission of one of the most celebrated courtesans of the world-history; they were so refined that, it is alleged, she would have none of them; wherefore the painter preferred to keep them himself. And as they stand now—they are a triumphant vindication of the reputation of the greatest of the "petits-maitres" of the last century. When a supremely beautiful picture, or collection of pictures, is brought suddenly to one's notice, enthusiasm dims all possible faults. These exquisite masterpieces of Fragonard have the vice of artificiality and a certain pseudo-classical insincerity. But they are altogether charming. And charm redeems a great deal of insincerity. He labelled them, not altogether mystically, under the title of the "Romance of Love and Youth:" a monarch and his unworthy mistress. But this does not matter at all; the pictures are in many ways incomparable. Fragonard had of all his contemporaries, the art of expressing sentiment in the highest and noblest sense. Greuze thought he had it, and he was frequently prurient, the worst form of pru-

riency—uttered under disguise, and yet obviously expressed. Watteau, dainty, delicate, eighteenth century. But Fragonard (of whose work Mr. Phillips reminds us we have no example in our national collections) had a better motive, a purer and surer instinct. Perhaps he was more than a "petit-maitre." Perhaps he was a great master.

ANOTHER serious subsidence has occurred in London Road, Northwich. The sinkage is generally admitted to be the worst that has happened in this Cheshire salt town for many years. The subsidence nearest approaching to the present occurred on May 19th, 1892, when the offices of a solicitor collapsed, and a large area was affected by the depression. On that occasion, although the building was almost turned topsy-turvy, scarcely a pane of glass was broken, the offices being erected on the composite principle. The rottenness of the present has been known for a long period, and several years ago a foundation of timber decking was provided. This has given way, the result being that the roadway sank for a distance of forty yards by six yards. The chasm is of a zig-zag character, and reminds one somewhat of a switchback railway. A much larger area, however, is affected, a circumference measuring sixty square yards showing cracks. The deepest part of the depression was fully a dozen feet, and on a level with the bed of the River Weaver running close by. The premises occupied by Messrs. P. Taylor and Son, contractors, and tenanted by Mr. Pickering, suffered so that

THE CADMON CROSS.

the front wall came fully 4ft. out of the perpendicular. A public-house called the Bridge Inn adjoining was also so seriously affected that it was considered advisable to remove the furniture and close the house. The walls in every room were cracked to the extent of several inches, while the fireplaces throughout the house were displaced. Some loose boxes on the opposite side of the road were in a measure broken up and wrecked.

THE Borough Polytechnic, which was formally opened only eight years ago, has been steadily increasing in size and importance, and the number of students is now over 3000. For some time the trade classes, which have been started to meet the demand made by artisans and apprentices, have been carried on under considerable difficulties through insufficient space; indeed, all the work of the institute has been hampered by the want of class-rooms and workshops. A new and very extensive addition has now been made to the buildings previously existing. The new buildings include an excellent carpenters' and wheelwrights' workshop, fitted with all the necessary appliances, while next door is the boot and shoe workshop. But the Polytechnic is particularly proud of its new machine bakery, to which a laboratory is attached for research work in fermentation. This is the first practical bread and confectionery school organised in connection with a public institution, and the experiment has met with great success. Above the workshops a fine gymnasium has been built.

THE Coronet Theatre—which has the very great advantage of being within a stone's throw of Notting Hill Gate Station—has now opened its doors. The Coronet is London's latest theatre. It is one of the best examples of the modern playhouse. It stands on a corner site in the busy High Street of Notting Hill, a position which has allowed of the building being completely isolated. The decorations by Waring afford one more illustration of the vitality of the later Renaissance types. The charming interior shows what can be done by artistic ability and taste, even in dealing with such a hackneyed style as that of Louis XVI. Columns have been used with particularly happy effect to accentuate the vertical lines. The cultivated eye will also notice the repose obtained by the judicious use of one dominant colour—in this instance, a rich deeply-toned yellow which, by the way, harmonises very well with the tapestry drop curtain and hangings. Altogether the effect must be pronounced very artistic and agreeable. The ceiling has been painted by Mr. A. W. Black—whose mural decorations at Her Majesty's Theatre form so prominent a feature in its beauties—with designs representing "The Four Seasons." Stalls and pit occupy the floor space, the dress and upper circles the tier above, and above these again a gallery of noble proportions capable of taking a round thousand persons to its seats. The full accommodation of the building is for 2500 spectators, and there are no columns to obstruct the view of anyone in the auditorium. The private boxes are ten in number. Ample room has been provided on the stage, which is 40ft. wide and 70ft. deep. The electric light is of course installed throughout. Mr. W. G. R. Sprague, the architect, has everywhere given convenience of entry and exit, and the greatest safeguards from fire and the results of panic.

THE second of the great blocks of administrative buildings at the back of the old Admiralty is now being roofed in, and it will probably be ready for occupation in eight or nine months. That was to have been the practical completion of the work of providing increased accommodation. What remained was to have been chiefly of an ornamental character. On the corner of the old building adjoining the Horse Guards the plans provide for a dome corresponding to that on the opposite new building, and a handsome covered colonnade was to have run along the north side of the parade and joined the old Admiralty to the new. It appears, however, that the increase of the Navy since these works were planned has been found to demand such an increase in

the Admiralty staff that the block now nearly finished will prove insufficient, and yet another pile is under consideration. It is, we understand, not yet decided on, but the probability is that across that side of the quadrangle where the colonnade was to have been a third new block will be raised, and the quadrangle quite shut in.

A CORRESPONDENT writing to the Times from Rome makes an announcement which will horrify every lover of the "Eternal City"—a description, by the way, which is hardly appropriate now that the authorities of the city are never happy unless they are destroying it. Their next piece of vandalism, it seems, is to be to remove the graves from the foreigners' cemetery by the Porta San Paolo, to cut down the well-known group of pines and cypresses, and to throw the space thus gained into a new straight street. The Porta San Paolo, the red walls and towers, the Pyramid of Caius Cestius, and this group of pines form one of the finest and most familiar features of Rome. It is melancholy to think of the amount of destruction—often not merely unnecessary, but disastrous, which the modern Municipio has wrought upon the city committed to its charge.

A MUSEUM of antiquities and curios formed by the late Dr. Paterson, Fernfield, Bridge of Allan, was sold by auction in Dowell's Rooms, Edinburgh, last week. The following are some of the best prices:—Small antique chest, with hammered metal mounts, belonged to Mary Queen of Scots, £3 10s.; carved oak high-backed chair, in stamped crimson plush, £4 15s.; rare old Scottish carved oak arm chair, £16; carved oak high-back chair, stuffed seat in sewed work, £6 10s.; old oak coffer with carved and inlaid front panels, £5.

THE fortieth annual general meeting of the Society for the Encouragement of the Fine Arts was held in the Conduit Galleries, Conduit Street, on Thursday week. Mr. P. H. Newman, hon. secretary and treasurer, presented the report and balance-sheet, which showed a deficiency of about £27. The meetings of the past season had been very successful, and an interesting and attractive programme of lectures on various branches of the fine Arts had been arranged for the coming season. The council had to deplore several serious personal losses to the Society during the present year. The most recent was that of their distinguished president, the Earl of Lathom, and they had also to express their great regret at the death of two of their colleagues—Lieut.-Colonel Hartley and Mr. J. Edmeston, F.R.I.B.A., both old members of the Society.

WE are suffering from a severe epidemic of improvements in London just now. In almost all parts of the capital historic places are being ruthlessly demolished to make way for wider streets and improved sanitation. New Inn is shortly to be sacrificed. It is a venerable and sequestered nook at the back of Wych Street, and it boasts of numerous historic associations. It is mentioned in most of the old chronicles, and was a noted resort in the fifteenth century. A most interesting fact in connection with the inn is that here the old custom of calling the hours of the night has not been suspended.

NOVEMBER 26th was the anniversary of the death of a man whose name has passed into the common currency of our language. Although his contemporary, Telford, is almost forgotten, those who have not the slightest knowledge of the history of road making are familiar with the name of Macadam. Born in Scotland six years after the middle of the eighteenth century, he began to make experiments in the construction of roads about 1810, and so enthusiastic did he become that, at a cost of something like £5000, he is said to have travelled over 30,000 miles—no trifling accomplishment in the early years of this century—in quest of experience. The Bristol Turnpike Trust appointed him its surveyor in 1816, three years before his method of roadmaking formed the subject of a Select Committee of the

House of Commons. Unlike Telford, Macadam did not approve of an artificial foundation; indeed, even on boggy ground sufficiently firm only for a man to walk on the surface, he would at once lay his pieces of angular stone. It will be recalled that, impoverished through his labours, Macadam petitioned Parliament for his expenses and something by way of reward; and finally, in 1827, £10,000 was voted to him, and he was appointed Surveyor General of the Metropolitan area. The value of his labours, in particular as they affected the mail coach communication before railway days, can hardly be over-estimated.

PROFESSOR G. FORBES read before the Society of Arts in London, on Wednesday week, a paper on the long-distance transmission of electric power, overhead wires being supposed. Professor Forbes has lately been engaged in considering the utilisation of the Nile Cataracts, and he finds that the electric lighting of Cairo could be done cheaper by power generated at the First Cataract than by steam engines at Cairo, although the distance is 400 miles. Before long the cataracts would be harnessed and forced to assist in developing not only Egypt proper, but also the Soudan, and especially the Dongola province up to the Fourth Cataract. The matter of long-distance transmission appears to have been first brought to Professor Forbes's notice by an inquiry which reached him as to the possibility of transmitting power from the Victoria Falls on the Zambesi to the gold mines of Rhodesia. On working the matter out he was astonished to find that the scheme would be financially and electrically a sound one, and his conclusion was that anyone undertaking it would not want the enormous capital hitherto thought necessary.

THE death is announced of Sir John Fowler, the engineer. His achievements included railway, dock, and bridge construction. The undertaking which added most lustre to his career was the erection of the Forth Bridge, of which he was the chief engineer in association with Sir Benjamin Baker. The work was begun in January, 1883, and the first train crossed the gigantic structure just seven years after. The cost, which was first estimated at £1,600,000, was actually about two-and-a-half millions sterling. The greatest number of men employed at one time was 5000, and, despite the greatest precautions, fifty-six lives were lost during the progress of the work.

SOME time ago, the Museums and Galleries Sub-Committee of the Glasgow Corporation resolved to hold in the People's Palace during the month of December a special exhibition of wood carving and of the ornamental treatment of wood generally, and to offer in connection therewith money prizes and awards of merit for the best examples of carving sent in for competition. This is a new departure on the part of the Art section of the Corporation, and it promises to be as successful as it is novel. Wide interest in the competition has been displayed all over the kingdom, and already a large number of excellent panels and other objects have been received. To the Loan Department also important contributions have been promised, among the lenders being the Science and Art Department, South Kensington; the School of Art Wood Carving, Imperial Institute; Messrs. J. and J. Gibson, of Edinburgh; and Mr. M. Carthew-Yorston, of Canobie.

THE governors of the Memorial Picture Gallery at Stratford-on-Avon have just received as a gift an interesting old portrait of King Richard II. The picture was formerly in the possession of the Earl of Shrewsbury and Talbot, and was sold at the famous sale at Alton Towers. It has been presented to the Memorial by Mr. J. R. Furness, of Plas-Manor, Conway. The portrait is undoubtedly some centuries old, but is in excellent preservation, and the King is represented in his State robes, with crown and jewelled collar. The picture is chiefly interesting on account of its being the portrait of the hero of one of Shakespeare's

historical plays. Several persons have declared it to be a contemporary likeness to the King.

It is almost an invariable rule for a public body when considering tenders to accept the one that is the lowest. Just the reverse policy has, however, been adopted by the London County Council in connection with the supply of certain gas engines. Six firms competed, and the commission has been placed with the one submitting the highest tender, although in consequence the cost to the ratepayers will be ten per cent. in excess of what it would otherwise have been. The reason is that the firm who are thus successful have on several occasions done good work, and in the opinion of the engineer the highest tender will prove the lowest in the long run. The incident is worth commenting upon, if only because of the effect it must have in checking the cutting of prices that too often is noticeable in connection with public contracts. When it is seen that the price is not regarded as the essence of the competition we may be sure that firms will not show an undue desire to obtain contracts by means of "starving."

A CORRESPONDENT writes:—"Is it not time that something was done by the authorities to check the growing obstructions of the City streets? Apparently any kind of advertising device, no matter how cumbersome, heavy, or dangerous, may be moved erratically about, or planted anywhere off the footpath in the streets for an indefinite period, to the inconvenience of the community at large. If a horse be left untended, or a lorry is kept standing beyond a prescribed time, the police very properly interfere, but unnecessary devices seem to have the freedom of the streets to an extent that calls for the attention of the Watch Committee."

THE "Villa dei Cedri," at the Bagno a Ripoli, near Florence, in which the Duke and Duchess of Connaught will reside during the winter, is an old mansion, the history of which dates back some centuries. It stands about three miles to the east of Florence, on the left bank of the Arno, in the midst of a very rich and cultivated country, where fruit trees, vines and olives grow in abundance. On three sides of the villa are gardens, beyond which are large and fertile "poderi." It contains a large salon, on the walls of which are some good frescoes. In the fifteenth century the villa belonged to the Laroni family (related to the Bardi), from whom it passed to the Nasi family, an offshoot of the Counts Guidi Signori del Casentino. In 1678 Zutorzo Nasi left the villa as a legacy to the Jesuits, who kept possession of it till 1773, at which period the Jesuits were suppressed. In 1775 the Marchesi Corsi bought the villa from the Grand Duchess of Tuscany. The family of the Corsi afterwards sold it in 1834 to Captain Samuel Charters, a Scotchman and military man, who in his turn sold it in 1841 to Mrs. Light, whose heirs are still in possession of it.

OVERLOOKING Reigate stands Colley Hill, rising to the height of 550ft., and the remarkable discovery has just been made that deep down in the sandstone formation lies a lake of considerable dimensions. In the neighbourhood of the Horseshoe stories have been current for a long time of mysterious subterranean caverns extending beneath the hill, and still more ancient tradition accredits one of these caves with having been the meeting-place of the Barons when preparing Magna Charta. It was certainly believed that extensive galleries had been formed by the quarrying of the sandstone used in the building of St. Paul's Cathedral and Windsor Castle. It has been found that there are some caves consisting of a series of chambers, about 24ft. by 20ft., and that each chamber had a door communicating with the next. On the floor of the cave broken into washed sand lay to the depth of 4in., showing that running water had been at work, and further search proved the existence at the far end of a spring of water. This spring, coming from the hill above, would, in a normal season, yield a large

supply, and had evidently done so, for on digging a few feet under the floor of the cave the explorers found a real lake of pure soft water.

ONE feature of the new London Central Railway will, we understand, be a new departure in the method of displaying station names. The directors of the construction company have been giving special attention to the matter, and will endeavour to effect an improvement on any system yet adopted, so far as the stations themselves are concerned. The extremely ingenious and satisfactory device for giving the name of the station the train is approaching inside the carriages, as in some of the District trains, is not contemplated, as we are informed. Next to this the best thing is a clear and adequate display of names on station walls. The usual plan is to make some very good tablets, and then to exercise the utmost possible ingenuity in concealing them among advertisements of pickles and cigarettes, mustards and dog biscuits, boots and bedsteads.

PUVIS DE CHAVANNES left about a thousand drawings and studies, which will be distributed according to an arrangement made by the painter's family. All the studies made for the decoration of the Hotel de Ville will go to the Paris Municipality. The studies relating to the mural paintings in Amiens, Lyons, Marseilles, and Poitiers will go to the museums of those towns; and those made for the Sorbonne and the Pantheon to the Luxembourg. The remainder are destined for the Academy of Macon, the artist's native place.

THE Bishop of Liverpool, the rector and churchwardens, have issued an appeal for assistance towards completing the repairs at St. Peter's Cathedral and Parish Church, Liverpool. "It seems a pity," they state, "that the work should have to be abandoned for lack of funds, and at the risk of having the church closed now, when not only is the expensive scaffolding 'in situ,' but the contractors have got together an intelligent gang of skilled workmen who thoroughly understand the work. Surely we shall not appeal in vain to our fellow-citizens to save their venerable parish church, with its associations, hallowed to so many generations of Liverpool people, from falling into ruin."

MESSES. HARRY HEMS AND SONS, of Exeter, have just placed in the newly-built church of St. Andrew, Paignton, a fine old Norman font which for many centuries must have done duty in the baptism of thousands of young Devonians born in the neighbourhood of Torbay. At the beginning of this century, however, the font was rudely cast out from the church and went through various adventures, being ultimately found doing duty as a flower-pot in the garden of a peasant. It was cracked, and the lower portions had been used for the making of concrete. Through the generosity of a lady resident the font has been restored, all the whitewash and other "improvements" having been removed, and the handsome original patterns of the sculpture exposed. The restored font is mounted on a sumptuous base of Devonshire variegated marble, with a supporting cluster of eight columns of Purbeck marble. The font itself is of Paignton red sandstone.

A FACSIMILE reproduction in bronze of the celebrated old fountain, called "The Gooseman," in the market-place of Nuremberg (executed in the sixteenth or seventeenth century by Lobenwolf), has been lately erected in Fitzwilliam Square, Dublin, by the Commissioners. It stands in a handsome basin of grey Aberdeen granite, also copied from the original fountain (omitting the ironwork), at the south-east corner of the enclosure, where it has been much admired. The bronze figure was supplied by Vandam and Co., of Victoria Street, Westminster, and Nuremberg. The only other copy known to them of this remarkable work exposed in public is erected over the celebrated Elizabeth Fountain at Homburg.

VERY shortly will be issued by Mr. Quaritch, and to subscribers only, Mr. Henry Wallis's new work on "Egyptian Ceramic Art." This comely quarto contains, besides Mr. Wallis's text, thirty plates in colours and nearly two hundred cuts printed with the type. All of them are reproduced from the author's own drawings, and under his superintendence, from examples examined by him in the principal museums of Egyptian Art, such as the British Museum, at Berlin, the Louvre, at Ghizeh, and at Athens, as well as in private collections.

THE prints which Mr. Rupert Bunny entitles "Oil Drawings" are produced by the following process:—The required design is painted in oil-colours upon a copper plate; from this a single impression only is taken upon plate paper. Thus, unlike any other known process of printing, this one of Mr. Bunny's does not multiply the designs it produces. The advantages of it are not apparent in description; but, when one comes face to face with the artist's work in it, one realises that very charming effect, scarcely otherwise attainable, can be produced by its means. Oil-painting upon paper would not produce anything like the qualities that Mr. Bunny arrives at; and though watercolour would come nearer to rendering the effect, scarcely could the same texture be arrived at in that material. The general effect produced by Mr. Bunny's oil-drawings is something of that which mezzotints would have if they could be printed in several colours at the same time.

IF they are wise the Plumbers' Company will carefully consider the suggestions made with reference to the Registration Bill at the meeting that was held on Saturday week at Carpenters' Hall. In the past a reluctance to concede a single point has been shown, and in consequence the measure has failed to receive the sanction of the legislature. If the same policy is followed a like untoward fate, it is certain, will attend the measure, and the time and the money of the Company will alike be wasted. Not much is asked. All that is desired is that the Company shall accept the co-operation of those who by experience are aware what is called for.

MR. ROBERT VIGERS, president of the Surveyors' Institution, sat at the Medical Examination-hall, Embankment, last week, as arbitrator in the case of "Peareth v. The Great Central Railway Company," a claim for compensation in respect of twelve acres of land acquired by the railway company in crossing the Thorpe Mandeville estate, near Banbury, Northamptonshire, for the purposes of a connection with the Great Western Railway. It appeared that the Thorpe Mandeville estate comprised about 490 acres and a house, which had been specially arranged for the use of hunting tenants. It had, until the construction of the new line, been some distance from a railway, and had commanded a rental of from £350 to £500 a year, furnished. It was submitted that the value of the agricultural portion of the property was seriously diminished notwithstanding the construction of accommodation works, such as bridges, at an expense to the railway company of over £3450. Mr. Percival Fox Tuckett (Tuckett and Son), Mr. Howard Martin (Thurgood and Martin), and Mr. Charles Bidwell (Ely), gave evidence in support of the claimant's case, their estimates of the total compensation payable averaging £2700, inclusive of an allowance of 25 per cent. for compulsory sale. On behalf of the railway company, Mr. Edward Boyle, Q.C., submitted that 10 per cent. should be the *maximum* allowance, and that a sum of about £1500 would amply compensate the claimant. The principal experts for the railway company were Mr. Daniel Watney (past president of the Surveyors' Institution), Mr. J. H. Oakley (Daniel, Smith, Son, and Oakley), Mr. Alexander Stenning, Mr. H. R. Goddard (Bedford), and Mr. Lightfoot (Dunlop, Lightfoot, and Wallis). The award was reserved.

A NEW theatre has been erected at Luton at a cost of £19,000.

Professional Items.

ABERFELDY.—A large new distillery has been erected at Aberfeldy by Messrs. John Dewar and Sons, Limited. It is situated on the banks of the Tay, about a quarter of a mile from the Aberfeldy Station. With its beautiful position, this new distillery attains pretensions to which the majority of Scotch distilleries can lay no claim. Mr. C. C. Doig, of Elgin, is the architect.

BLACKMORE.—St. Lawrence Church, Blackmore, has just been reopened, after alterations and repairs. It is estimated that the work will cost about £1500. The north arcade, which was some twelve inches out of the perpendicular, has been completely re-built, the old stones being put back in their former positions and new ones introduced. The roof of the nave has been reframed with new oak rafters, the old wood being employed where sound. It has also been sealed, the old bosses and shields being replaced, with the addition of a few fresh ones inserted at the east end to take the place of plaster. The Norman arch and part of the west end of the north aisle have been opened up by the removal of the heating apparatus, which has been replaced by a new one. The floor at the east end of the church has been re-arranged, and new carved oak choir stalls have been provided. The contractors are Messrs. Letch and Bowtle, of Braintree.

BLACKPOOL.—A new Liberal Club has been erected at Blackpool. The design is by Mr. Herbert Wade. The elevation is of Nelson dressed stone, with three shops in Victoria Street, and three at the back. The entrance is at the westerly end of the buildings. A wide staircase is lighted with leaded windows. On the first floor are a reading room, smoke room, secretary's room, assembly room, and steward's store room, all large and well-appointed apartments. The billiard room and card room are on the top story. The site the club occupies is one of 56ft. square, and the total cost has been about £8000. The general contractors were S. Butterworth and Sons, and the sub-contractors:—Joinery, T. Lawson and Co.; plumbing and painting, S. Walsh; brickwork, G. Sparrow; plastering and slating, W. Walker; electric lighting, R. Wilkinson; heating and ventilating, Dawson and Company, Stalybridge.

BRYNMAWR.—The Brynmawr Intermediate Schools have just been opened. The schools are designed to accommodate forty-four boys and twenty-seven girls, and are arranged so as to be capable of enlargement for an additional sixty scholars or more. The buildings are of Blue Pennant stone with Ebbw Vale buff brick dressings. The central block contains the class rooms, surmounted by a turret containing a powerful ventilator. Right and left are lower portions comprising cloak rooms, private rooms for master and mistress, &c., while at each extremity are receding wings containing laboratory, cookery room, and the future laundry. The girls' side, beside the usual class rooms, contains a cookery room, with gallery for the students and scullery attached. It also contains one large room destined as a laundry, and there is a music room, cloak room, private room for the mistress, &c. The boys' side is a counterpart, but instead of a cookery room contains a chemical laboratory. The contract for the work, amounting to £1883, was carried out by Mr. John Jenkins, Brynmawr, from the designs of Messrs. J. H. Phillips (Cardiff) and F. Baldwin (Brecon).

CARDIFF.—A new Wesleyan chapel has been opened at Albany Road, Cardiff. The building is of unusual shape, resultant upon the peculiar site. The massive tower rises to a height of about 100ft., and forms a landmark in this part of Cardiff. The principal entrance is through a lobby in the tower, and gives access, in addition to the chapel, to a large parlour and class room and vestry on the ground floor, with parlour and other class rooms on the

floors above. One of the principal features noticeable upon entering the chapel is the pulpit, which is, as in most chapels, placed in the centre of the building. The general arrangements of the chapel are nave, transepts and side aisles, with a large choir, organ-chamber, and galleries. The building generally has a very light appearance, with plenty of window space, filled in with tinted cathedral glass. The building has been constructed with Newbridge stone facings, and Bath stone dressings. The cost of the building is £6800. The contractors are Messrs. E. Turner and Sons, of Cardiff, and the architects Messrs. J. F. Jones, Richards, and Budgen.

DOLPHINHOLME.—The work of rebuilding the new church is now approaching completion. The nave floor is being laid with wood blocks, and the chancel with coloured tiles. The heating apparatus is completed, and it is hoped all the work will be finished in a few days. The new church occupies the site of the former one, and has a commanding aspect, being of fourteenth century design, with central tower, chancel and nave. The interior will have a warm and pleasant appearance, the inner walls being lined with the local red sandstone of the old fabric. The east window is a five-light traceried design, and it is proposed later on to insert stained glass. The old font is proposed to be re-used for the present, being a monolith of singular design.

KENSINGTON.—Sir John T. Brunner, Bart, M.P., has recently presented to this Essex Church a very handsome case for the organ. The work has been designed in the style of the fourteenth century screen work, and has been carried out in oak left in its natural colour. The organ is placed in the south-east angle of south aisle, and shows on two sides of the church, which are divided into bays with open and cusped arcading, surmounted with a carved cornice. This forms the main stage of the organ case, all the spaces being filled in with burnished metal speaking pipes. The upper portion above cornice is arranged into gables with traceried panels and corbelled portions carrying a further tier of speaking pipes, and finishing in panelled pinnacles and crockets, the whole forming a pleasing feature to the interior of the church. The work has been designed by Mr. Howard Chatfield Clarke, and has been carried out by the builder of the organ, Mr. Alfred Kirkland, of Upper Holloway.

PENTYRCH.—The new schools for Pentyrch School Board have just been opened. The architect of the building is Mr. Bruce Vaughan, F.R.I.B.A., of Cardiff. The schools, which have involved an outlay of £2100, will accommodate 214 children.

SALFORD.—The memorial-stone of the school that is in course of erection by the Salford School Board in Langworthy Road, Pendleton, was laid last week. The school will contain three departments, accommodating respectively 376 boys, 376 girls, and 442 infants. The boys' and girls' departments will each contain a schoolroom and four classrooms divided by movable partitions, together with the necessary cloakrooms and rooms for teachers. The infants' school is being built on the central hall system, a large assembly hall being provided into which seven classrooms open, each accommodating from fifty to sixty children. Special provision is being made for instruction in cookery and laundry work for girls, and in manual instruction for boys. A caretaker's house is also being erected at one corner of the site. The architects were Messrs. Potts, Son, and Hennings, of Manchester. The contract for the main building is being carried out by Messrs. Storrs, Sons, and Co. Limited, Stalybridge; the iron and steel work by Messrs. Dunkerley and Co., Manchester; and the concreting and asphaltting by Messrs. Davies and Co., Manchester. The cost of the site, including the paving of the surrounding streets and legal charges, was £3680, and it is estimated that the building, including the furnishing, caretaker's house, and all other expenses, will cost £13,000.

Under Discussion.

AN ARCHITECT ABROAD.

"A Cruise in the Eastern Mediterranean" was the title of an address given by Mr. John Tweedale, F.R.I.B.A., before the members of the Leeds and Yorkshire Architectural Society at their last meeting. The lecture, which was illustrated with lantern slides, dealt with life and scenery in Greece, Palestine, and Egypt.

THE USE OF STEEL IN BUILDINGS.

At a recent meeting of the Manchester Association of Engineers, Mr. Edward Wood read a paper on "The Use of Steel in Buildings." Mr. H. Webb, President of the Association, occupied the chair. In the course of his paper Mr. Wood said that, in the opinion of many persons, the English were behind the Americans in the use of steel for buildings. In America the high buildings were constructed almost entirely of steel, with the walls and floors filled in afterwards. English architects and engineers were now falling into line, and the American system was being largely adopted. The difference in the practice of steel construction between the American and the English system was accounted for to a large extent by the differences in the conditions. The architects in each country were bound by the respective building laws, and whereas what were considered fireproof buildings in England would not very likely be passed in America, it was almost certain that the authorities would not allow buildings to be erected in Manchester of twenty or thirty stories, or, as they were called, "sky-scrapers." Mr. Wood proceeded to adduce reasons showing why steel was the best material for use in the constructional parts of warehouses, manufacturing, engineering works, and similar buildings, and also described the most recent adaptation of steel as applied by some of the leading architects and engineers of the day.

Enquiry Department.

COTTAGE ARCHITECTURE.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I shall be much obliged if you can tell me of a good book on Cottage Architecture (ornamental). Your journals, of course, give many good sketches, but I want something more compact. J. M. S.

Tonbridge.

We recommend you to obtain a copy of Mr. Norman Shaw's book on Cottage Design, published by B. T. Batsford. The work is now out of print, however, and you may have some difficulty in securing a copy.

ROOF TIMBERING.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Will you kindly give me a simple formula for calculating the sizes of timbers for principals for corrugated galvanised iron roofs (see Fig. 1). This is the usual form of roofing out here, and iron is the only covering not rendered impracticable by the cost, and in warehouses, etc., it is often necessary to cover large spans without intermediate supports (up to 50ft. or 60ft., say). It should be borne in mind that the lighter the principals are the better, consistent with strength, and that all our common scantlings are cut from 9in. by 3in. deals, for example: 4½in. by 1½in., 4½in. by 3in., 9in. by 1½in., 3in. by 2½in., etc. There are no common rafters, boarding, felt, and slate or tiles. Simply the principals (never more than 6ft. apart), purlins, and corrugated iron in 6ft. to 10ft. lengths, which is in itself a means of stiffness. Would it not be possible to construct curved principals somewhat on the lines of De Lormé's, but of course much lighter?

Any suggestions you can make will be carefully considered, and received with thanks.—
Yours faithfully,
P. J. J.

Kimberley, South Africa.

Probably the forms of roof which would suit our correspondent best are those for light and temporary structures, in common use in France and Belgium, of which a few forms and types are illustrated herewith, and which are constructed of thin boards, single or double, as the construction necessitates, bolted or pinned together at the joints. The roofs of the buildings for the Rouen Exhibition were of this character, and models of others for different spans were shown at the Antwerp Exhibition a few years previously.

A DEFECTIVE DRAINAGE SCHEME.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I am taking the liberty of sending you enclosed plan (Fig. 1) and particulars of a new building and drainage scheme, together with the by-laws, the said plan having just been passed by the local authorities of Clacton, and shall esteem it a favour if you will give me your opinion upon the drainage system through your paper this week.

My own opinion as a Surveyor is that the drainage system is entirely wrong, and not according to the afore-mentioned by-laws."

However, I will leave the matter for your general remarks, which I trust we may see in your next issue.—Yours faithfully,

November 21st, 1898. J. W. MARTIN.

We have, fortunately, been able to see a copy of the current issue of the Walton News and Coast Times, and so to obtain much fuller information than is contained in our correspondent's necessarily brief letter. So far as we can see an attempt has been made, and has to some extent been allowed, by the passing of the plan by the local authority, to convert an old private drain into a sewer, repairable by the authority at the ratepayers' expense, by the simple expedient of running a new drain into it, so as to make it convey sewage from

FIG. 1. A DEFECTIVE DRAINAGE SCHEME. FIG. 2.

two distinct premises. But under Sections 61 and 63 of the by-laws the new drain must discharge into a "sewer into which such drain may lawfully empty." This stipulation cannot be complied with by discharging into an old "drain;" but the new drain must be distinct, discharging separately into the existing "sewer." The proper way of doing this is shown on the accompanying sketch (Fig. 2) in a series of strokes, with inspection chambers at each change of direction, so as to allow of easy clearing by means of rods in case of stoppages.

These inspection chambers do not appear to be insisted upon under the Clacton by-laws, as they would be in most urban districts, but they are essential to good work; and it may be mentioned that, where they are used in conjunction with half channel through pipes and three-quarter round bends, connections can be made from branches flowing in at right angles, and even sharper, to the main, with perfect safety, and without introducing what is technically a right-angled junction, as described in Section 64.

A. Corrugated Iron.
B. The purlins are 3in. by 2½in. and the principals spaced 6ft. centre to centre.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ABERTILLERY.—For making a road (2 miles) to Aberbeeg, and for widening the main road from Aberbeeg to Crumlin (24 miles), for the Urban District Council. Mr. J. McBeen, engineer, 1, King-street, Abertillery. Quantities by engineer:—

Preece	£18,849 4 11	Noel Bagley	£14,347 18 5
Wm. Brown	17,467 7 3	Howells	14,275 0 2
Meredith	16,158 1 9	Lewis	13,713 8 8
Mainwaring and Davis	15,687 2 0	Monks & Parfitt, Newport, Mon.*	12,313 19 10
Willis	15,438 16 3		*Accepted.

BRIDLINGTON QUAY.—For erecting a chalet and pair of villas, for Messrs. Whitaker Bros., Bridlington Quay. Mr. W. S. Walker, architect, Bridlington Quay:—

Chalet.		Pair of villas.	
E. Corner	£1,360		
T. Blackburn	£879 5		1,200
S. Booth			1,140
W. Barnes			1,105
J. Taylor	796 16		1,025

CARDIFF.—For the erection of a fish market, &c. The Hayes, for the Corporation. Mr. W. Harpur, Borough Engineer, Town Hall, Cardiff:—

Geo. Griffiths	£15,058 19 8	Shepton & Sons	£13,941 13 0
H. Gibbon	14,937 12 10	W. Thomas & Co.	13,786 0 0
Hubb and Co.	14,598 4 9	Evans Bros.	13,739 15 10
J. Thomas	14,313 0 0	James Allan	13,696 13 9
Powell & Mansfield	14,325 4 6	W. T. Symonds	13,454 0 0
Latty and Co.	14,140 0 0	Rees & Thomas	13,285 0 0
		Turner & Sons*	12,988 0 0

[All of Cardiff.]
*Accepted.

DOVER.—For the supply of 1,520 tons Guernsey granite, for the Town Council. Mr. E. Wollaston Knockor, surveyor, Castle Hill House, Dover:—

At per ton.		At per lineal foot.	
Broken Granite		Radiated Chan-	Radiated
Siftings.		Kerb. nelling.	Chan-
		nelling.	
s.d. s.d. s.d. s.d.		s.d. s.d. s.d. s.d.	

ELGIN.—For the erection of a church, Rothies. Mr. G. utherland, architect, 51, High-street, Elgin:—

Masonry.—D. Forsyth Elgin	
Carpentry.—A. Robb, Rothies	
Plastering.—Logie and Green, Fochabers	
Plumbing.—Ross Bros., Dufftown	£2,100
Slating.—J. Wilson, Dufftown	
Painting.—J. James, Elgin	
Heating.—R. Tyndall, Aberdeen	

HITCHIN.—For the erection of a Town Hall, &c. for the Urban District Council. Messrs. Mountford and G. Lucas, architects, 17, Buckingham-street, Strand, London, W.C.:—

Howard	£6,998 0 0	Willmott l.	£6,487 0 0
Warren	6,920 0 0	Menides	6,364 0 0
French	6,874 16 11	Foster	6,150 0 0
Coleman	6,543 0 0	Redhouse*	5,814 0 0

*Accepted subject to reductions.

LEOMINSTER.—For the erection of cottage hospital in South-street, for the Hospital Trustees. Mr. Ernest G. Davies, architect, 6, St. John's-street, Hereford. Quantities by the architect:—

Page and Son	£1,825	T. Holland	£1,412
J. J. Davies	1,769	J. Watkins*	1,395
J. Morgan	1,698	C. Edwards	1,350
W. C. Taylor	1,494		

*Accepted subject to slight alterations—reduced to £1,300.

LISS (Hants).—For the erection of a residence in the Forest. Mr. H. T. Keates, architect, Petersfield:—

A. Etherington	£2,750 10	Pocock Bros.	£1,336 0
W. Mould	1,427 0	W. Jenkins, Liss*	1,300 0

*Accepted.

"ROOFING" and other FELTS

In Rolls 25yds. Long, 32in. Wide. Any quantity sent off at a moment's notice.

ANDREW POTTER, MANUFACTURER, MELBOURNE WORKS, WOLVERHAMPTON.

Specifications Free.

LONDON.—For additions to factory, 175 to 189, Hackney-road, N.E., for Messrs. Masters Bros. Mr. Alfred J. Martin, architect, 386, Old-street, E.C. Quantities supplied:—

Brown and Harris	£2,395	Todd and Co.	£1,627
Woodward and Co.	1,783	Goodall	1,625
Kilby and Gayford	1,764	Jarvis and Sons	1,466
Chessum and Sons	1,729		

LONDON.—For decorations and sanitary work at Mountgrove, Greenhill-road, Hampstead, N.W., for the Rev. A. J. Harvey. Mr. Harvey Dyball, architect, 35, Bucklersbury, E.C.:—

Howard & Son	£2,151 4 9	R. A. Lowe	£1,727 0 0
Whitby, Slater, & Whitby	1,760 0 0	Lole & Lightfoot	1,669 0 0
Burford and Son	1,755 0 0	H. Hanks	1,471 10 0

LONDON.—For alterations to the sanitary arrangements at the Renfrew-road Workhouse, S.E., for the Lambeth Guardians, under the superintendence of Mr. G. Crowder, Clerk of Works:—

CONTRACTS OPEN.

TO BUILDERS, CONTRACTORS, and SUB-CONTRACTORS.

The Urban District Council of Buxton desire to receive TENDERS for the ERECTION of an ELECTRIC LIGHTING GENERATING STATION at Buxton.

Tenders will be received as a whole, or in the separate trades, i.e., excavator, concretor, mason, bricklayer, slater, plasterer, smith and founder, carpenter and joiner, ironmonger, plumber, glazier, and painter.

Also for a CHIMNEY SHAFT about 120ft. high and 6ft. internal diameter, and CONNECTING BOILER FLUES.

Plans may be seen, and quantities obtained, on and after DECEMBER 14th prox., by application to the Architect to the Council, Mr. W. E. BRYDEN, F.R.I.B.A., of 1, George-street, Buxton, on deposit of One Guinea, which will be returned upon receipt of a bona-fide Tender.

Sealed Tenders must be addressed to Mr. JOSIAH TAYLOR, Clerk to the Council.

It is to be understood that the said Council do not pledge themselves to accept the lowest or any Tender.

JOSIAH TAYLOR,
Clerk to the Council.
Town Hall, Buxton,
November 26th, 1898.

EDMONTON SCHOOL BOARD.

TENDERS are invited for the ERECTION of a NEW INFANTS' SCHOOL at Eldon-road, Lower Edmonton.

Persons desirous of Tendering must send in their names to the undersigned not later than NOON, SATURDAY, DECEMBER 10th, 1898, accompanied by a £5 Bank of England note, which will be returned on the receipt of a bona-fide Tender.

The plans and specification, prepared by H. W. DOBB, Esq., of 110, London-wall, E.C., may be seen at his Office during the usual office hours, and copies of the bill of quantities, by Messrs. YOUNG and BROWN, 7, Southampton-street, Bloomsbury-square, W.C., will be forwarded on or before DECEMBER 13th, 1898.

The contract will contain the ordinary Trades Union clause as to hours and wages.

Sealed Tenders, endorsed "Eldon-road Infants' School," are to be delivered to the undersigned not later than NOON, TUESDAY, DECEMBER 20th, 1898.

The Board do not bind themselves to accept the lowest or any Tender.

JOHN MOULE,
Clerk to the Board.
School Board Offices,
Upper Edmonton.

TO BUILDERS AND CONTRACTORS.

BURGHILL ASYLUM, HEREFORD.

The Visiting Committee invite TENDERS for the ERECTION of TWO NEW BLOCKS and other ADDITIONS at the Hereford County and City Asylum at Burghill.

Quantities can be obtained, and specification and drawings inspected at the Offices of the Architects, Messrs. GILES, GOUGH, and TROLLOPE, 28, Craven-street, Charing Cross, London, on payment of a deposit of Three Guineas, which will be returned on receipt of a bona-fide Tender.

For the convenience of local contractors the specifications and drawings will be deposited at the Offices of the County Council, at the Shire Hall, Hereford, on certain days, particulars of which can be obtained from the Architect.

Sealed Tenders, to be delivered on forms provided, addressed to the Clerk to the Committee, Burghill Asylum, not later than TEN a.m. on WEDNESDAY, DECEMBER 25th.

The Committee do not bind themselves to accept the lowest or any Tender.

Burghill Asylum,
Hereford.
H. E. MORGAN,
Clerk to the Visiting Committee.

INTRODUCTION OF NON-FLAMMABLE WOOD INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to
Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"IOWA" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.

"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known
colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING,
(each of which is over eighteen stories high).

"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company
by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,
2, Army and Navy Mansions, Victoria Street, London, S.W.

THE CONSTRUCTION OF HOSPITALS For Consumption and other Infectious Diseases.*

BY DR. JOHN W. HAYWARD.

(Continued from page cxxvi.)

By the foregoing arrangements the whole hospital and every individual ward will be efficiently ventilated all the year round, with cool air in summer and warm in winter, almost automatically; and without labour or cost, except for the warming furnaces; and with both ventilation and warming completely under control.

That efficient hospital ventilation can ever be automatic and costless may, perhaps, appear really absurd; it is, however, not so absurd as it may appear. This will be evident by reference to the natural laws of atmospheric pressure and of its expansion by heat. In fact, the idea that the atmosphere cannot be caused to pass through a hospital or other building at a rate of emptying and replenishing every twenty minutes, by having the inside warm and the outside cold, with sufficient openings at the bottom and top, is itself absurd to anyone familiar with dynamics. The real questions are: (1) Can its passage be controlled and regulated to the average of twenty minutes? (2) Can it be so warmed that the occupants will not feel it as an unpleasant current or draught? Both these questions may be answered in the affirmative. In the scheme here propounded, indeed, the automatic and nearly costless character, and its appropriateness to hospitals, follow of necessity from advantage being taken of the laws of atmospheric pressure, and providing openings and flues and means of warming and cooling so as to meet the requirements of the laws. Here is the pivot, the cause of success, in particular the openings and flues and the means of warming the incoming air. Without these, the arrangement would not act efficiently; with them it is an unequivocal and unqualified success; the air inside the hospital being warm and light, and that outside being cool and relatively heavy; the heavy air entering at the basement and the light air escaping at the roof, the outside air presses in through the inlets and the inside air presses out through the outlets at a speed determined by the difference in weight; that is, in winter, a difference between air averaging about 35deg. F. or lower and about 65deg. F. or higher. Now, according to the laws of atmospheric pressure, this difference produces a speed of at least 8ft. per second, in ordinary flues or chimneys. (See Blue Book, p. 6, and Health and Comfort, p. 26; also p. 106, where illustrations are given.)† In the hospital flues the speed will be increased by the vacuum produced by the Boyles' abstractors fixed on their terminal ends, and would be further increased by a gas light in their lower ends, perhaps together to 12ft. or 16ft. per second; that is, if the air had to pass only through flues; it has however to pass through the hospital:—entering at the basement inlets, it has to pass up between the warming pipes and through the gratings in the corridor floors; the obstruction offered by these impediments will reduce the speed perhaps one third; but even if it reduced it one half; that is, to only 6ft. per second, this would be an excessive and dangerous current, because with

this speed the air would be passed into and through the wards at a rate to replenish them every four minutes. This would of course be too rapid movement of the air through the wards, and would be felt as a draught; it would therefore have to be checked by partially closing the ward inlets, or preferably the outlets, so as to reduce the speed at least one half, because the wards ought not to be emptied and replenished oftener than every twenty minutes. An outlet flue, equal to 8in. square, even if reduced to 4in. at its terminal end, would be quite enough to give passage in twenty minutes to all the air of a ward of 1000 cubic feet area; that is of a single-bed ward.

If therefore the inlets and outlets be properly proportioned and open, and there be free passage for the air up through the hospital, the ordinary atmospheric pressure will carry on the ventilation quite efficiently, and the whole hospital will be kept fresh and comfortable by the natural forces alone. There is no fear that the speed will not be enough to keep up efficient ventilation; it is more likely to be too great; but there need be no fear of its being too great, because it is completely under control, and can be regulated to any rate desired, by the valves at the ward inlets and outlets; or be arrested altogether by the shutters at the primary and secondary inlets. In order to ensure this ample ventilation, however, both inlets and outlets must be open; if the inlets be closed the heavy outside air will press its way through the outlets, and there will be down-draught, at any rate if fires are causing draught up the chimneys. If the outlets be closed the air will have difficulty in entering at the inlets, even though these be wide open, because if the air cannot get out, it will not come in. In either case there will be stagnation, discomfort, and unhealthiness; that is, unless there are fires to prevent these untoward results, which in summer there will not be, nor will there be in winter either, if the wards are warmed by heated pipes. In spring and autumn the difference in weight may average not more than between air at 45deg. and 65deg. F., but this will produce a speed of about 6ft. per second, and with it an 8in. square outlet will be capable of giving passage to all the air of a single bed ward in nine minutes, which is still too rapid; but, in this instance, as in the others, it can be diminished to the required twenty minutes by the valves and shutters, the regulation of which will be a matter of very little trouble, not more than the opening and closing of windows.

The plan here sketched-out is, in its main features, natural or "spontaneous" ventilation. Natural ventilation is certainly much to be preferred to any and every artificial system, whether on the plenum or vacuum principle, and it is, of course, much less complicated. It is, indeed, comparative simplicity itself—merely arranging openings and warming the air, and, as shown above, it acts more than efficiently. It also involves very little original outlay, and comparatively no permanent cost for maintenance. Whereas all artificial systems involve costly original plant of machinery, as well as heavy permanent expense for maintenance in engines, engineers, fuel, &c., and with all they cannot be made as efficient or nearly so pleasant and healthy in operation.*

warmer air ascending and the colder and heavier descending; the greater the difference of temperature the greater being the difference of weight and of the rapidity of interchange. . . . A cubic foot of air—
at 30deg. F., weighs 569.2 grains.
at 70deg. F., weighs 526.2 grains.

making a difference of 43.0 grains.

for the 40deg. under the same atmospheric pressure, viz. 30 miles of mercury." (Blue Book, pp. 5, 6.) This difference in weight produces a speed of at least 10ft. per second, in ordinary flues or chimneys. (For demonstration see Health and Comfort, p. 107, et seq.)

* Of course, I am well aware that it is generally maintained that mechanical power is required for efficient hospital ventilation, that the necessary movement of the air cannot be procured without artificial means. But, it may be asked, have the natural forces been properly utilised in the experiment? Have the necessary conditions been provided? Have the requisite openings and flues and free passage for the air through the hospital been provided with the necessary means for warming and cooling the air? Have the arrangements been

Of course, the air passing through the hospital at the rate of emptying and replenishing every twenty minutes will be in a state of movement through the wards, and the patients will feel it as a draught; that is, unless it is sufficiently warm—if the temperature be at all below 65deg. F. Ventilation should never be attempted with cold air; all attempts to ventilate with air below 60deg. F. are both cruel and futile—cruel, because such ventilation is productive of discomfort, pain, and risk to the occupants; and futile, because it will be sure to be shut off on every possible occasion, and perhaps just when most needed. "Cold draughts," say the commissioners, "are so inconvenient that every endeavour is practised to obstruct the inlet. . . . It should be borne in mind that the occupants of a room will feel comfortable in a temperature of 60deg. to 62deg. in an undisturbed atmosphere, but will not feel warm at a much higher temperature if the air be at all in motion"—(Blue Book, pp. 64, 120). It will, indeed, be felt as a draught even at a higher temperature than 65deg. F. if the speed be considerable. "The air," says the writer in the "Encyclopædia," "cannot be changed oftener than three times in the hour; in no part of the ward should there be a greater speed than 1½ft. per second, except at the point of entrance where it should not exceed 5ft. per second, and at the outlet where it may be somewhat higher" (*loc. cit.*). In winter, when the ventilation has to be principally through the basement, the inrush of cold air through the primary inlets may sometimes be so great that it will be necessary to control it by the shutters—with a strong south-east or south-west wind, for instance. These primary openings should always bear a proportion to the heat communicated by the warming apparatus, to the number of patients in the hospital, and as to whether fires are burning in the wards or not.*

adjusted to the different seasons of the year? Has it been borne in mind that a difference of 40deg. in temperature between the outside and inside of ordinary flues or chimneys produces a speed of about 10ft. per second, that a difference of 30deg. produces a speed of 8ft., and of 15deg. 4ft.? Have these states been produced and used under the necessary conditions? And have arrangements been provided for making these speeds available? I am not aware that they have; in fact, they have not. The only attempt that I am aware of was made in the Liverpool Hahnemann Hospital; but there it has been hampered by the introduction of a foul-air chamber, and long, uncleanable outlet flues.

Now it will, I think, be admitted by all who are familiar with dynamics, that when the external temperature is below 30deg. F., and the interior of the hospital is above 60deg. F.,—which difference produces a speed of about 8ft. per second—by letting in the outer air at the basement and giving it free passage up through the hospital and out through the ceilings of the wards, the movement of the air through the wards will be quite rapid enough to ensure efficient ventilation, without mechanical help of any kind; that indeed it will be too rapid, notwithstanding the obstruction by inevitable friction during its passage through the hospital. During some days in spring and autumn, and generally in summer, the actual difference between the outside and inside air may not be more than 20deg. or 15deg., but even then the speed will be over 4ft. per second. Even in the hot sultry days of summer, when the atmosphere is comparatively still, the bodies and respiration of the patients, being over 98deg. F., will raise the temperature of the air surrounding them sufficiently to cause it to rise and move upwards away from them, and more so if air at a lower temperature is at the same time moving into the ward to take its place, consequently, if the outside air entering at the basement and being there cooled by ice, is passing up through the corridors and into and through the wards, more movement of the air of the wards—that is, more ventilation will be effected in the hot days of summer without open windows than with them (see "Health and Comfort," pp. 19, 20), because open windows themselves, even on both sides of the ward, cannot cause "ventilation" in the proper sense of the word; that is, cannot cause the air to move either into or out of the ward. Some better provision than open windows is necessary for ventilation when the outer air is motionless, some provision that will cause a difference in the temperature, and therefore in the weight of the outside and inside air, and so cause it to move. For these—in this country—rare occasions ice placed near the primary inlet is much preferable to the original outlay and the permanent cost of motive power by fans.

* I am, of course, well aware that some medical practitioners do recommend hospitals to be ventilated only by open windows on both sides of large wards, even in winter in this climate, and maintain that there is neither risk nor discomfort in doing so. They do not themselves, however, submit to such ventilation; that is, they do not themselves sit in their study, or have their families to sit in the morning room or sleep in bedrooms with windows to the east open all the winter through! And it is only bounce for matrons and nurses to acquiesce in such an arrangement and uphold it; they are themselves not confined to beds underneath open windows, but are moving about in and out

AUTHORITIES:—

NOTE.—ENCYCLOPEDIA BRITANNICA, 9th Edition, 1891. Article: "Hospitals."

BLUE BOOK: "Report of the Commissioners appointed by Government to inquire into the best means of warming and ventilating apartments of dwelling-houses and barracks." Printed by order of the House of Commons, 1857.

HEALTH AND COMFORT IN HOUSE BUILDING, 3rd Edition, 1890.—E. and F. N. Spon, 125, Strand, London.

* A paper read before the Liverpool Architectural Society on Nov. 7th, 1898.

† "The ventilation of rooms and buildings," say the Government Commissioners, "depends in a great measure upon the ascending and descending currents of air caused by the difference in temperature, the

On each story of each pavilion there should be a nurse's room; a ward kitchen, with food-lift, and fitted up with enamelled slate—no woodwork; a urine testing and sputum examining and destroying room, also fitted up with enamelled slate; and a bathroom and water-closet: the bathroom should be large and comfortable, because baths are of great importance. Perhaps the most suitable locality for the nurse's room—which should be ventilated and warmed along with the wards—and for the ward kitchen, with food-lift, &c., will be the north-east end of the pavilion; and for which increase of space may be gained by a little extension eastwards; and for the testing room—which should be convenient for the nurse, because she generally has the testing to do—the north-west end. (See plans B, C, D.) The water-closet and bathroom, with cold shower, should be outside; and perhaps the best place for them will be midway between the pavilions, approached by a vestibule with swing doors (see plan D); or perhaps they might be in the north-east corner, approached through the testing room with swing door at each end. But the architect will arrange all such matters as these.

In anticipation of an infectious fever being accidentally introduced, there should be one or two wards set apart, also separated from the hospital by a vestibule with swing doors; these should be ventilated and warmed in the same way as the other wards.

To be in readiness for accidents, an operating theatre, with glass-lined instrument cupboard, should be provided; it should be well lighted, and should be ventilated and warmed on the same plan as the wards, but with proportionately larger fresh air supply and extra warming power, so that the temperature may be raised to 80° F. if necessary.

There should also be provided a small bacteriological laboratory, ventilated and warmed on the same plan.

The foregoing plan of construction, ventilation, and warming meets all requirements of the writer in the "Encyclopædia Britannica," and most of those of the Government Commissioners and of the authors of "Health and Comfort in House Building;" and it is easy to perceive that it will act as well at night as in the daytime, and in winter as in summer; that it is equally applicable to few wards or many, to large hospitals and small, and to general hospitals as well as special; also that ample currents of cold air may be rushed through the whole hospital or through separate stories or individual wards by the windows alone, and yet be completely under control;—regulated or stopped at pleasure; and that the same may be accomplished from the bottom upwards to the top by the special inlets and outlets alone, and in this case also it can be regulated and controlled, or arrested altogether: also that in cold weather the same may be accomplished with air warmed by the warming apparatus, and this also completely under control; also that in winter the incoming air may be warmed to almost any degree by the warming apparatus; and in summer cooled to almost any degree by ice being placed in the fresh air chambers; also that the air, as well as being dried and filtered, may be disinfected, medicated or perfumed at pleasure, before passing into the hospital; also that the patients may have all the available sunshine all the year round—in the eastern wards, during the forepart of the day, and in the western wards during the after part of the day; and that this also can be

of the wards. Nor do they submit to it in their own rooms during cold easterly windy days and nights. The helpless patients scarcely dare complain or even admit that they feel a draught if the nurse says they do not. Nor perhaps do they suffer very greatly from it whilst tucked up in blankets, except in pulmonary ailments; but what about when they have to sit up or get out of bed at night under an open window at Christmas? For consumptive patients this would be both distressing and dangerous; in this country they are not in hospital to be "dosed" but for comfort and protection, and for the treatment of complications. Some doctors are, however, beginning to treat consumptives with open windows at all times, night as well as day and winter as well as summer; and in all weathers, frost and snow and wind and storm too, that is, "fresh air" at all risks. This will perhaps afford them a better chance than do foul unventilated apartments, whether private or hospital, but it is "kill or cure" treatment.

effectually regulated and controlled by blinds that will thoroughly darken, so as to exclude the sunshine when necessary, as in brain affections, sleeplessness, and such like states. That indeed altogether little is left to be desired as to the ventilation, warming or sunlight—three of the great essentials of health and comfort in hospitals, as they are in private houses.

For such a hospital as the one herein supposed the central corridors should not be less than 6ft. wide, they may be lighted by having a large window at the end; this should be constructed on the same plan as the ward windows. The wards on each side of the corridors may be as many or as few as required by the size of the hospital to be erected, the size of the land, and other considerations. The single bed wards need not be larger than 12ft. wide, 12ft. long, and 13ft. in height.*

Inasmuch as in hospitals for consumption the patients do not spend the greater part of their time in the wards, but in the convalescent rooms, these should be quite a feature of the hospital, and should be as large and comfortable and as much open to the sunshine as possible. The best position for them is the southern end of the pavilions, at the south-west corners, with large bay window at the end, so that the patients may have all the available sunshine of the day (see Plans B, C, D), one on each story of each pavilion. When desirable, the sunshine can easily be excluded by darkening blinds, but of course it could not be obtained in any way or at any time in rooms or wards to the north-east, however much desired. They may be warmed by Pidgeon Teale grates. Having the wards only along the south side of the corridors, allows the corridors to be utilised as the convalescent rooms; but this not only involves more ground space and requires more warming power, but it deprives the convalescent rooms of all sunshine, which is a fatal objection.

For fine weather there should be an open air recreation ground, as large as possible, and as open as possible to the whole day's sunshine, with seats and provision for games, such as croquet, bowls, tennis, &c. It is the possibility to bask all day in dry open-air sunshine that makes Grand Canary, South Africa, New Zealand, Egypt and California, of so great advantage to consumptive and other invalids.

Also, if it can be afforded, a small farm out in the country at a high elevation, where

* "There is," says the writer in the Encyclopædia, "little to be gained by raising the ceiling higher than 13ft.; indeed, 12ft. is practically high enough. Above 12ft. there is little or no movement of the air except towards the ventilators. The space above is, therefore, of little value as ventilation . . . increase of height adds to the cost of construction, increases the expense of warming, and makes cleaning more difficult, and to a great extent hampers ventilation" (loc. cit.). "In barracks," say the Government Commissioners, "the soldiers' rooms are about 12ft. in height; with good ventilation this might be reduced to 11ft., or even 10ft. without disadvantage. The continuous removal of impure air as it rises is of very much greater importance than the cubical contents of air in a room."—Blue Book, p. 92. Nevertheless, the more air space the better if the warming and ventilation be in proportion.

These three authorities (to which reference is here made) may be considered the best on the subjects on which they treat, but they leave some important points incompletely worked out:—

Though the writer in the Encyclopædia insists strongly on the necessity of efficient ventilation and warming he does not attempt to grapple with the difficulties involved in satisfactorily providing these. In the way of ventilation he suggests little else than open windows; and for warming he merely mentions open fires and hot water pipes; he says nothing whatever about adaptation to the different seasons of the year, just as if the same provisions would serve for all alike!

The Government Commissioners enter very fully and elaborately into the necessities for ventilation and warming, and into the causes of the failure of the ordinary methods, especially those by open fires. They insist that the inlets shall let in only warmed air, and only at the lowest part of the room; and that the outlets shall give exit to the foul air at the highest part; but the methods they suggest are not either very practicable or successful; and they do not insist upon control of the inlets, or provision against down-draught through the outlets, either by shutters at the mouths or abstractors on their terminal ends.

The authors of "Health and Comfort in House Building" are very specific and satisfactory on both ventilation and warming; but the outlets they recommend are not suitable for hospitals, being long, tortuous, and insusceptible of being easily cleaned; they are therefore liable to harbour dust and germs, which down-draught might drive back into the wards.

patients, in the early stage of the disease, can be kept in active exertion in the open air the greater part of the twenty-four hours. It would also be well if vigorous mountain climbing could be enforced daily in the very early stage of the disease.

The larder and the principal kitchen should of course, be at the north-east corner of the building, for the sake of coolness to the butter, milk, flesh meat, &c., and so as not to intercept the sunshine to the wards and corridors. Placing the larder and kitchens to the sunshine—to the south, south-east, or south-west—is a mistake that should never be perpetrated, nor be tolerated under any circumstances whatever. And on no account should the hospital be so placed that the wards are not towards the midday sunshine.

The out-patient department and the dispensary should, of course, be easy of approach from out of doors and of access from the in-patient department, and yet so cut off from the latter as to prevent air passing from one to the other. They should be ventilated and warmed on the same plan as the rest of the hospital, but it is not necessary they should face the sunshine; their position, size, and general construction will have to be subordinated to the general arrangement of the hospital. The waiting-room should be as large and well lighted as possible, and very thoroughly ventilated. It should also be well washed throughout and air flushed, and the floor (if of wood) well rubbed with bees' wax and turpentine every day, and should always be under the influence of some strong disinfectant when not occupied.

The foregoing is but a small part of the work and responsibility involved in the erection of a hospital. The rest, however, comes more within the province of the architect than of the medical man.

THE London County Council, at its meeting last week, decided to suspend a certain standing order, so that it might itself erect working-class dwellings on the Ann Street, Poplar, area. It was considered that on this particular site it would be impossible to erect dwellings which should comply with the standing order that such undertakings should be self-supporting; and the effect of the decision is to waive this condition. The new buildings, which will be commenced forthwith, are to accommodate 180 persons.

THE Parliamentary notices for the coming session contain a most important project for dealing with the rapidly increasing suburban traffic to and from the northern districts of London. Under the auspices of the Great Northern Railway Company a new company has been formed for the construction of a deep-level electric line from Wood Green to the Strand. It is proposed that the line shall be deposited in four sections. The first two—from Wood Green to Finsbury Park, and from Finsbury Park to King's Cross—will run practically the whole way under property of the Great Northern Railway Company. From King's Cross the line will run under the Metropolitan Railway, and so via Judd Street, Russell Square, and Southampton Street, to Holborn, this being what is called the third section. Section No. 4 extends from Holborn to the Strand, running beneath the projected new street of the London County Council, and the terminus is to be at the end of this new thoroughfare, in the vicinity of Somerset House. The stations for the underground route—so far as concerns that portion of it under the existing Great Northern line—will follow the sites of the present stations of that Company. There is to be an exchange station at Finsbury Park, underneath the existing station—and a station at King's Cross beneath the present terminus. It is probable that another station will be constructed at Russell Square, and in all likelihood arrangements will be made for an interchange of traffic at Holborn with the Central London Railway. The new line, which, if sanctioned by Parliament, may be made within five years, practically gives a direct route to the West End from the whole of the Great Northern suburban district.

VENTILATION.

By W. N. TWELVETREES, M.I.M.E., M.S.I.

(Continued from page xcii.)

IV.

It is well that a clear understanding should be obtained as to the value of sufficient space per head in any apartment or building. For this purpose the building may be assumed to be hermetically closed and without ventilation. The time required for vitiation by respiration may then be readily calculated to any given degree. It has already been shown (Fig. 9) that respired air contains four parts per cent. of CO_2 , and that the volume of air expelled at each respiration by an adult varies from 30 to 40 cubic inches. The average 35, multiplied by the number of respirations per minute, gives the total of 560 cubic inches, which may be safely taken as the largest quantity likely to be met with under any ordinary circumstances.

As 4 per cent. represents the proportion of CO_2 , the quantity produced per minute is $4 \div (560 \div 1728)$, or $4 \times .324 \times 1.296$. For the purpose of simplifying calculation this may be stated as 1.3, and the time occupied by the process of vitiation will be thus found:—

$$T = C \times (a - b) \div 1.3$$

Here, T is the time; C, capacity of the room in cubic feet; a, percentage of CO_2 in vitiated air; b, percentage of CO_2 in original air.

Taking a room of 500 cubic feet capacity, the time required for vitiation to the extent of 1 per cent. CO_2 will be found to be:— $500 \times (1 - .04) \div 1.3 (= 500 \times .06 \div 1.3) = 23.07$ minutes. Table X. has been calculated in this manner, the co-efficient 1.3 being multiplied by 2 in the case of a paraffin lamp, and by 4 for an ordinary gas burner. In ordinary practice no room is capable of being hermetically closed, because windows, doors, and walls all permit the passage of air to a limited degree. Nevertheless, the figures prove conclusively the necessity for proper means of ventilation, and furnish a striking condemnation of the grave defects evidenced in the construction of many dwelling-houses and offices. In such the only means provided for the admission of fresh air consist of windows and doors, and, when these are tightly closed in cold or draughty weather, the unfortunate inmate, whilst deriving temporary comfort, so far as warmth is concerned, runs the risk of permanent injury to his constitution and vital power. When gas or oil stoves are used, the evil is, of course, materially increased.

Coming now to figures of positive rather than of negative character, such as the above, it may be demonstrated what will be the actual effect produced upon the atmosphere of a room by the admission of varying quantities of air per head. The tables and diagrams previously given and based upon theoretical and other data afford no indication as to the standard of purity maintained. This may be ascertained by calculation in the following manner:—

$$S = b + (1.3 \div C),$$

where S is the standard of purity as gauged by the percentage of CO_2 ; b, the percentage of CO_2 in original air; C, the cubic feet of air admitted per minute; and 1.3 is the co-efficient of vitiation, as before.

Supposing it is desired to ascertain the standard of purity which may be obtained in a room where 20 cubic feet of fresh air are admitted per head per minute, the rule will be thus expressed:—

$$.04 + (1.3 \div 20) = .105.$$

Conversely, it is easy to determine what volume of air will be required to maintain any given standard of purity in a room, by reversing the rule as follows:

$$C = 1.3 \div (S - b)$$

Table XI. has been calculated by the former of these two rules, and shows conclusively that where it is desired to ensure an entirely wholesome atmosphere, considerably larger

quantities of air must be admitted than those prescribed by some of the text-books which have been relied upon in the past. When gas lights or lamps are used it will be necessary as before to make due allowance for their powers of vitiation.

Apart from its undoubted capability for the production of carbonic acid, coal gas is calculated to produce prejudicial effects when escaping into air breathed. A consideration of its constituent parts (Table XII.) are sufficient to convince the most sceptical that the greatest care should be exercised with regard to the employment of gas for the purposes either of lighting or warming. Electric light should certainly be used whenever available, not only on account of its

FIG. 14.

greater healthfulness, but because its adoption considerably simplifies the general problems connected with ventilation. Fires when used for warming also require air, the quantity averaging from 800 to 1000 cubic feet per minute for each fireplace. Although this air is vitiated, the conditions differ materially from those existing in the case of gas lights and gas stoves, because the products of combustion from a fire do not enter the room. Further, air which is partly vitiated by respiration, gas lights, animal heat and exhalations, is still available for promoting combustion.

Notwithstanding the fact that an open fire tends to encourage the admission of fresh air from every available point, it is desirable that inlets should always be provided with due regard to the individual requirements of every fireplace. These differ so much in size and construction that the subject cannot for the moment be treated exhaustively. In some cases the supply of fresh air may already be on a sufficiently liberal scale to provide for all necessities.

Next in order to the foregoing questions comes the consideration of various modes in which ventilation may be attempted. In order to secure the conversion of attempts into accomplished facts, it is necessary, when dealing with natural ventilation, to bear in mind the physical characteristics of air and the laws by which it is governed. As in Nature, variations of temperature, and, consequently, of specific gravity at different parts of the

FIG. 15.

earth's surface, create breezes and winds, so do similar differences in connection with buildings produce movements of air. If these be properly ordered and regulated, ventilation may be ensured. Heat, whatever may be its immediate source, is so inseparably connected with ventilation that it is somewhat difficult to exclude it from present consideration. As, however, the subject will be entered upon at a later period, the existence of sufficient heat for the provision of motive force in ventilating shafts and ducts will be assumed to exist.

The dimensions of air inlets and outlets exercise a most important bearing on efficiency, but these again will be discussed under a separate heading. In the meantime it will be most convenient to enquire into some methods which have been and are still being adopted, and to examine their respective merits and

demerits. Ventilation, in its most elementary form, is illustrated by the case assumed in Fig. 14, where the air, contained in a room, being at 62 deg. F., is lighter than an equal volume of outer air at 32 deg. F., occupying an imaginary room, shown in dotted lines. The relative weights being in the ratio of 1 to 1.06, the heavier air descends and drives out the air in the room, as indicated by the arrows.

If air inlets be too small, external pressure will be exercised on the outlet, thus causing a descending current of cold air in the room. Again, the inlet, although large enough to avoid this drawback, may still be too small to prevent an unpleasant draught. As a rule such an effect is avoided by making the inlet of ample size, so as to reduce the velocity of the entering current to about 4ft. or 5ft. per second. The positions of both inlet and outlet are of importance, as will afterwards be shown.

(To be continued.)

The Streets and Roads Committee of the Aberdeen Town Council has decided to lay out a new street on the Spital estate. The street is to be 50ft. in width.

ACCOUNTS for the first twelve months' working of the combined dust destructor and electric light undertaking in Shoreditch show a gross profit of nearly £6000. The Electric Light Committee estimate that the saving on the dust destructor, as compared with the old method of disposing of refuse, was £1253, and they conclude that the net profit and saving on the dust destructor and lighting combined has been, for the twelve months, £2679. It should be borne in mind that during the first three months, when the work done was very small, there was a loss of £500, and that the Vestry has reduced the price of current by 33 per cent. during the year.

A BEGINNING has been made with the Staines reservoirs scheme, which is to save London from water famines. Two immense reservoirs are now under construction on Staines Moor, which, when completed, will have a capacity of 3300 million gallons. The mind is not readily capable of grasping the meaning of such stupendous figures; but, to put it in another way, it may be said these reservoirs will be about 1½ miles in length and varying from a mile to a little over half a mile in breadth, with anything from 15ft. to 20ft. depth of water. Nearly two thousand men are at work on these great undertakings, which will cost over a million sterling. The works are the joint enterprise of the Grand Junction, West Middlesex, and New River companies. Great, however, as the works may be, they are only part of the original scheme for national storage reservoirs, formulated some five or six years ago. This project provided for nine reservoirs, each with a capacity of 2000 million gallons, capable of ensuring a daily average supply of 300 million gallons for the use of the metropolis. Meanwhile, it will take quite four years to complete the two reservoirs already in hand.

INQUIRIES go to show that cracks have recently revealed themselves in several buildings in Cheapside and King Street. It is contended by the railway authorities that this is a coincidence, and in no way due to the boring, and it is pointed out that the powerful tubes in which the lines are placed tend rather to strengthen than to weaken the ground. Moreover, as a precaution against any interference, the tunnels are placed under the roadways, and not beneath the buildings. The long spell of dry weather and the clay soil upon which Cheapside is built would, it is said, be quite sufficient to account for the cracks. The occupants of the buildings that have shown signs of "settling down" are becoming anxious as to the safety of the premises, and are obtaining the best advice possible in order to ascertain the cause of the subsidence. No cracks, it is pointed out, were perceived prior to the commencement of the tunnelling for the railway; and, though it will undoubtedly be a somewhat difficult task to prove that the subsidence is due to these excavations, the owners of the premises affected will not be likely to rest contented until the matter has been settled by arbitration.

Surveying and Sanitary Notes.

THE Penrith Urban District Council on September 6th addressed to the Local Government Board a letter stating that at a meeting of the Council it had been resolved:—"That, having regard to the difficulties of purchasing land for the disposal of the sewage on the principle of broad irrigation, the Local Government Board be respectfully requested to give the Council their views as to the adaptability for Penrith of the septic system of sewage treatment, which is now receiving so much attention from sanitary reformers." The Clerk, in forwarding the resolution, stated that its terms "are not to be taken so as to affect the present position of the question as to the provisional order proceedings already taken, but any advice of the Board which might lead to an easier arrangement to secure the means of the purification of the Penrith sewage would be considered of great advantage if received at an early date."—Mr. Alfred Adrian, the Assistant Secretary of the Local Government Board, writing on September 30th, stated that the Board "cannot undertake to advise the Urban District Council of Penrith as to whether the septic system of sewage treatment would be suitable for adoption in their district. It may be stated, however, that the Board have had this method of treatment under consideration, and the main principle which has so far been established is that, if the septic system is adopted, it is necessary that the effluent from the tanks and filters should be subjected to further treatment on land before being allowed to pass into a water-course. The Board have also come to the conclusion that the septic system can only be regarded as an experimental substitute for an ordinary process of chemical precipitation. They would not, therefore, be prepared to entertain any proposal for the adoption of that system in connection with a scheme of sewerage for the urban district unless provision were made in the scheme for the purification of the effluent from the tanks and filters on a sufficient area of land. They would also require the Urban District Council to accept the entire responsibility for the experiment, and to give an undertaking that, in the event of the

process failing to give satisfactory results, they will adopt in its place some process of treating the sewage with chemicals combined with artificial filtration."

A CASE of considerable importance to local authorities was decided on Wednesday week at the Monmouthshire Quarter Sessions, held at Usk. The main sewer, constructed by the Ystradfydwg and Pontypridd Main Sewerage Board, runs through the parish of Rhymney and discharges into the Bristol Channel. The Newport Union Assessment Committee recently brought this portion of the sewer into assessment, and rated it at an assessment of £700 nett rateable value. Against this assessment the Sewerage Board appealed. Counsel for the appellants relied on the judgment given by Lord Herschell in the House of Lords in the appeal of the London County Council on the proper assessment of the West Ham sewer.—The Court gave judgment for the appellants, and decided that only a very short length of the sewer—owing to its construction—was rateable, assessing that portion at £145 gross and £105 nett rateable value, with costs to the appellants.

At the Town Hall, Newcastle, an inquiry ordered by the Local Government Board has been held into an application by the Council for sanction to borrow £750 for street improvement purposes, and £7000 for market purposes. The Town Clerk explained the purposes for which the loans were required. The first item of £750 was for the purchase of three houses at the east end of Douglas Terrace and the south end of Derby Street, in order to throw their sites into the street, and improve the line of both Douglas Terrace and Derby Street. The owner of the houses had offered to sell them for £750. The loan of £7000 was for improving the meat and provision market. £3500 of it was for the renewal of the roof, which was erected over fifty years ago. There was no debt on the buildings, but the land was mortgaged forty years ago for £20,000. The market site was now worth £60,000. Of the balance, £2500 was for altering what was called the wide alley of the market, by extending the shops in advance of the existing shop line by 5ft., and fitting these shops with frame-fronts and stalls. There was £500 for altering the stalls in the centre, and £500 for contingent works.

The Aberdeen Granite Trade.

IN view of the great falling-off in the granite trade at Aberdeen with the United States, increases in other branches of the industry are recorded. The following figures applicable to the exports from Aberdeen Harbour during the last financial year (ended September 30th, 1898) bear out this, and it is otherwise known that a large amount of business has been done during the present year by the monumental works, chiefly in the way of making ornamental fronts for buildings in the large towns in England and elsewhere. Granite goods for America are shipped via Glasgow, but the statistics given below as to Aberdeen Harbour apply to exports for most places abroad, and also, of course, to such destinations as London, Newcastle, &c. The exports of stone from the port during the year mentioned may be summarised as follows:—Of causeway stones there were exported 35,284 tons, being a rise of 3881 tons upon the record for the previous year. As the average value of the stones may be taken at £1 a ton, the sett-making industry in this district is evidently still a considerable one. Then of kerb, pavement, and building stones there were exported during 1897-8 no less than 4479 tons, being an increase of 243 tons over the figures for the year preceding. The total weight of chips, rubble, &c., exported was 14,616 tons—a rise of 3399 tons. The exports of polished granite again amounted to 9349 tons, an increase of 367 tons. This item is of importance, as the value of polished granite for elaborate work is probably £20 per ton, while the average value of all grades is moderately estimated at £14 per ton. Of granite waste slabs ("adamant") there was exported last year 2898 tons—a rise of 1058 tons over the previous year. The imports of rough foreign granite have not been materially altered. These amounted to 12,619 tons, being a fall of only 1205 tons on the record of 1896-7. Most of this rough foreign granite comes from Norway and Sweden, and owing to the variety of colour available, it is largely used for the polished fronts as well as for cemetery monuments for the United States.
